Editor's preface

For the past twenty years I have been working at a programme drawn up along much the same lines as the programme outlined in the Introduction to *Being and Time*, and comprising a phenomenological philosophy (constructed on ontological foundations and employing what I call a 'genetic' methodology) and an epochal interpretation of the history of modern philosophy. I am therefore committed to the view that it is far too early to relegate Heidegger (even, and even especially, first Heidegger) to the status of a historical philosopher, that the source represented by the *Gesamtausgabe* holds a resource which is very far from being exhausted and that therefore, in a certain critically significant sense, phenomenological philosophy still operates within a framework whose basic parameters were laid down by the thinking to which this collection of papers is devoted. It is for this reason that I have sought to bring together papers which treat Heidegger's work as a living body of thought rather than a historically determined *corpus*.

Despite, or even perhaps because of, my involvement in a programme inspired by the Heideggerian example, my personal acquaintance with Heideggerian scholars and thinkers was, prior to this editorial venture, quite limited. Perhaps the most agreeable aspect of my task has been the opportunity it afforded me to get to know those working in the field and to do so in the most satisfying manner, by publishing the work they so generously made available to me.

By far the most laborious feature of my editorial task has been the extraordinary number of translations (over one volume's worth!) I have had to do from the French and the German in order to make it possible to include papers from the two cultures which have contributed most to our understanding of Heidegger. I have however also been helped by the readiness of certain of my English-speaking contributors to do translations of their colleagues' papers as also by the efforts of several of my

foreign-language authors to get their papers into an English version. My task has also been greatly assisted by the willingness of so many of my contributors to write original pieces for this collection, thereby circumventing permissions problems while, at the same time, throwing fresh light upon the scene. It is not an exaggeration to say that, without the assistance and encouragement of so many of my authors, so many that it is impossible for me to name them individually, this huge collection could never have been put together.

At least two, entirely unforeseen, circumstances prompted me to undertake this work and made it possible for me to complete it on schedule. In the Summer of 1989, I returned to London after a Heidegger conference in Bonn, sponsored by the Alexander von Humboldt Foundation, to find my mother critically ill with cancer and in need of constant attention. *Critical Assessments* was a suitable labour for me to undertake while attending to someone who, however, did not live long enough to see the completion of the task that her condition made it both necessary and possible for me to take on. Richard Stoneman, the editor of the series, not only first proposed this project to me but, in the period of financial insecurity which followed upon my mother's death, advanced me a sum of money without which I should not have enjoyed the freedom to complete the project on time. To my mother goes the dedication of this work, while thanks are due to Richard Stoneman (and to his editorial assistant Heather McCallum, to Adrian Driscoll, Maria Stasiak and Virginia Myers) for the support he has shown over the two-year period when this project moved, sometimes with seemingly imperceptible slowness, from idea to reality.

Introduction

Christopher Macann

To think is to confine yourself to a
single thought that one day stands
still like a star in the world's sky.

(Heidegger, *Aus der Erfahrung des Denkens*)

In 1989 the world celebrated the centennial of Heidegger's birth. And already, within twenty years of his death in 1976, we are in a position to say that the one thought to which Heidegger dedicated his life (the thought about Being) stands still like a star in the world's sky.

How does thinking of this order arise? Heidegger gives us plenty of clues. 'Out of long guarded speechlessness and out of the careful clarification of the cleared ground arises the utterance of the thinker.'¹ What a warning to those who today, and by virtue of the pressures imposed by the institutional environment in which they are obliged to work, feel compelled to rush into print at the earliest opportunity! 'To know how to question means to know how to wait, even for a whole lifetime.'² The great danger is then surely that this patient, life-consuming thinking will be perverted in a manner with which we are only too familiar and against which Heidegger constantly warned us. In a poem from the same text as that previously cited we find the following, poetically voiced, warning: 'Few are experienced enough in the/difference between an object of scholarship and a matter of thought.'³

This difference between philosophical thinking and academic scholarship is to be found all over his corpus. 'It is not a matter of knowing philosophy but rather of learning how to philosophize',⁴ he says in one of his earliest texts, the *Grundprobleme*. Or again, more forcibly and critically still:

We no longer think but simply busy ourselves with philosophy. In the

kind of competitiveness which such a business demands, philosophy is openly done as an 'ism' and each 'ism' seeks to outdo the other. The pervasiveness of such a conception of philosophy is not accidental. It rests, and especially today, upon a real dictatorship on the part of publicity.⁵

Never has Heidegger's comment been more pertinent than *today*, not the 'today' to which Heidegger himself refers but *our* today. For there have never been more 'isms' than today. We have *existentialism* and *structuralism* and *de-constructivism* and *relativism* and *post-modernism* and *Marxism* and *critical realism* and so on and so forth, so many schools of philosophy which, more than anything else, are schooled in the art of promoting their cause by getting their own works published and their own men into the available university positions.

'All this', Heidegger tells us elsewhere, 'would be highly comical, were it not deeply sad, showing as it does that philosophy no longer reflects upon the things and problems themselves but upon the books of colleagues.'⁶ And how? By encouraging and even requiring that philosophers run from conference to conference, from symposium to symposium, from seminar to seminar, using for this purpose instruments of international travel and communication which were barely conceivable in Heidegger's day, no matter how keenly he might already have felt the inauthenticity of

people today who travel from one conference to the other and get the feeling that something is really happening, as if they had been really doing something. But in fact they have just relieved themselves from work, and have tried to conceal their own helplessness under the cover of idle talk.⁷

It is astonishing that some fifty years ago, and in a university environment very different from (and in certain respects much healthier than) our own, Heidegger should have anticipated a state of affairs that has become quite characteristic of our own time. Nothing seems to me to sum up our *present* situation more poignantly than this last citation: 'The most thought-provoking thing about this, our most thought-provoking, age is that we are still not thinking.'⁸

It is the underlying objective of this collection of papers on the thinking of Martin Heidegger to remain true to this vision of philosophical thinking as an on-going enterprise which will never be completed, which at all times exhibits an inherent tendency to lapse back into mere scholarship and so has constantly to be dragged back into the light of thinking by, amongst other things, reawakening the original, living meaning of the basic questions and doing so with a view to assuming the burden of

thinking as one's own and carrying it on to whatever conclusions are implied by the single thought under whose star any and every thinker is born.

To put it in other words, I have tried to remain true to the very wording of the series to which this particular four-volume set belongs: *Heidegger: Critical Assessments*.

Two major obstacles face any attempt to arrive at a critical assessment of the philosophical significance of Heidegger's philosophy. The first is that of *uncritical dismissal*, either in the form of more or less deliberate ignorance of his work (largely operative in the analytical circles in which I was originally introduced to philosophy) or in the form (for which the historically famous example is provided by Carnap's critique, briefly referred to in Gadamer's paper) of a rigorous application of alien criteria of validity, from which it readily transpires that Heidegger's philosophy is not worth bothering with since it fails to conform to even minimal requirements of truth and meaningfulness. In view of the ever-increasing importance ascribed to Heidegger's thinking in certain circles, such a dismissal is barely sustainable today and reflects more discreditably upon those who attempt to voice it than it does upon Heidegger himself. But there is a second danger, that of *uncritical allegiance*, a danger to which Heidegger's thinking seems peculiarly susceptible despite the fact that it is so obviously contrary to the spirit in which he conducted his own philosophical inquiries – as the accumulation of citations at the beginning of this Introduction clearly and unequivocally attests.

Surely, the greatness of a thinker is to be measured by the fruitfulness of his thinking, the range and diversity of the thinking to which his own inquiries gave rise, and this even when the philosopher may himself not have intended any such deviation from the norms established by his own work. The classical case in point is that of Kant, who naively supposed that the Critical philosophy had solved all outstanding problems in the discipline and that nothing more remained for philosophers to do but rigorously apply his own canons to the various branches of thought to which they might apply and who, consequently, looked askance at attempts by such varied thinkers as Fichte and Schopenhauer to carry on the Kantian tradition in ways which the master never approved. To make matters worse, though both Fichte and Schopenhauer claimed to be true inheritors of the Kantian philosophy, neither could find anything of value in the thinking of the other, a discrepancy enshrined in Schopenhauer's cryptically witty dismissal of Fichte's principal work as *Wissenschaftsleere*. And yet, despite Kant's barely suppressed exasperation at the 'misguided' labours of his disciples, the Critical philosophy did not bring the richness and variety of German philosophy to a close but rather marked the beginning of one of the most astonishing outbursts of philosophical creativity the world has ever known, a phenomenon which

led Heidegger, in his own highly unorthodox Kant interpretation, to turn against Kant a remark which he (Kant) had himself directed at Plato: 'it is by no means unusual, upon comparing the thoughts which an author has expressed in regard to his subject, whether in ordinary conversation or in writing, to find that we understand him better than he has understood himself' (A 314 = B 371).

In the mouth of a Heidegger this remark is no haphazard and perhaps grudgingly conceded admission. For *Being and Time* laid the foundations of a hermeneutical method which refuses the very possibility of definitive and conclusive results in favour of an open-ended approach to the 'manifold meaning of being' (part of the title of the book by Brentano which served to awaken him from his theological slumbers). When Heidegger, in that famous passage from the Introduction to *Being and Time*, spoke of the *possibility* of phenomenology standing higher than actuality⁹ he had a quite specific target in mind. For the *actuality* of phenomenology at that time was marked by the thinking of his master, Edmund Husserl. In placing possibility above actuality Heidegger was surely creating for himself (and others) the leeway needed to question Husserl's conception of phenomenology and to recommend another, quite different, conception.

It might be argued that, in his later thinking, Heidegger rejected, as 'metaphysical' the kind of phenomenological thinking in which he had indulged at the outset of his career and that, consequently, such a project should not be attempted again. But this would lay Heidegger open to the charge that, having forced open the royal gate of metaphysics in order to secure admission for himself, he then took care to slam it shut behind him – so that no one else could come in after him. And this charge would be doubly incriminating. For not only did *Being and Time* win for Heidegger the audience which would later follow him down the far more esoteric paths of his later thinking and which he might have been condemned to pursuing in more or less Nietzschean isolation had it not been for the enormous success of his first published work; this later thinking was itself more personal and idiosyncratic than his first philosophy and therefore fell even more conclusively under the sway of that 'multiplicity of meaning' already acknowledged as a ruling principle in his hermeneutical philosophy, to the point that, in the end, philosophy, for Heidegger, is brought ever closer to poetry.

No doubt it was in view of the danger of uncritical allegiance that Heidegger himself chose as the motto for his *Gesamtausgabe* (the preparation of which occupied the last years of his life and the editorial responsibility for which he assigned to one of our contributors, Friedrich-Wilhelm von Herrmann) the following words: *Wege nicht Werke* (Ways not works). Authoritative pronouncements are enshrined in *works*. They cannot be captured in writings which are indicative of *ways*, ways of

thinking, ways which thinking might take, ways which do not necessarily lead anywhere, ways which are taken to set thinking in motion, not to get somewhere. It was surely also for this reason that Heidegger refused to permit his massive eighty-volume *Gesamtausgabe* to be accompanied by the kind of critical apparatus which has become customary today in scholarly circles. Heidegger wanted his *Complete Works* to feature as a source from which philosophers would draw not *information* but *inspiration*, the kind of inspiration which would set them on their own path of thinking.

But if Heidegger's thinking was designed to awaken in his readers a response which would direct them down the same path as that which he himself had pursued, we run up against a paradox. For paradoxically, though inevitably, 'same' means here 'different', that is, a path which would bring his students to *their own* thinking just as Heidegger had been brought to *his own* thinking by an obstinate, and often deliberately reticent, refusal to tread the beaten track. It is this inspirational response which is threatened by the second of the two dangers mentioned earlier, that of uncritical allegiance.

It is worth noting that uncritical allegiance is rarely, if ever, accorded to one thinker by another thinker. For example while, in general, *Being and Time* was received with immense enthusiasm by the philosophical public, this enthusiasm was by no means unqualified when it came to the leading spokesmen of the day. We know that Husserl's initial reaction to *Being and Time* was one of disappointment at the 'unscientific' direction phenomenology had taken with Heidegger (though this did not inhibit him from promoting the publication of the work in his own journal). Similarly, Jaspers intended to undertake a careful study of the work but found the labour insufficiently rewarding (for his own purposes) to justify the effort involved. Cassirer's objections to Heidegger's Kant interpretation are very clearly and effectively reproduced in the paper by Pierre Aubenque (see chap. 23, vol. II of the present work). And if we move on a generation to philosophers who were deeply influenced by Heidegger's first philosophy (I am thinking of figures like Sartre and Merleau-Ponty), we find thinkers whose works are not only cast in a very different mould but cast in a mould which Heidegger is sometimes constrained to reject as a mis-understanding of his own work – and I am thinking principally of Heidegger objections to the 'existentialism' Sartre claimed to find in *Being and Time* and which he (Sartre) worked out along quite different lines. In other words, those best qualified, by virtue of their own creative achievements, to judge the original quality of Heidegger's work have been those most likely to express reservations, or to develop Heidegger's thinking in directions he himself could not approve.

So, by a critical assessment of Martin Heidegger's work at least four

things will be meant. First, and most obviously, a critical appraisal of the value and validity of the various Heideggerian themes covered by the contributors to this collection. This involves bringing out the limitations as well as the strengths of the positions Heidegger assumed. Second, and less obviously, many contributors have sought to follow up their own critical intuitions and so to indicate, within the space available, alternative directions in which Heideggerian thinking might profitably be taken. Third, I have sought to solicit contributions from authors who have worked out their own philosophical positions, often in reaction to Heidegger. In this connection, I am particularly happy to be able to print a section from Michel Henry's *Essence of Manifestation*. Finally, I have also sought to trace the cross-cultural impact of Heidegger's thinking, sometimes upon thinkers who rejected, or who were never subjected to, the Heideggerian influence.

Nothing speaks more conclusively in favour of the legitimacy of such a critical approach to Heidegger's thinking than the fact that he himself adopted just such an approach, and not just to the thinking of others but also, and more importantly, to his own thinking, reproaching himself in the later course of his development for having written his first philosophy under the superseded, if not discredited, banner of 'metaphysics'. Hence the so-called *Kehre*, the 'turn' or 'turning' which both turned Heidegger away from the path indicated in the general programme outlined in *Being and Time* and returned him to beginning philosophy, to an ever more primordial quest for the origins of Western thinking in Greek thought.

The simplest, and therefore for this reason also perhaps most simplistic, way to present this reorientation is in terms of a shift from human being (*Dasein*) to Being (*Sein*). In a book on Heidegger's later philosophy, Kockelmans argues that, in *Being and Time*, 'Being' and 'World' are to some extent employed as equivalent terms and that therefore the task of investigating the meaning of Being, as such, had still not been satisfactorily completed in his first major work.¹⁰

But there is more to the *Kehre* than just this recognition of a task which had been assumed and never really carried through conclusively. More seriously, certain initial decisions carried his thinking in directions which were later to prove contentious. For instance, a great deal follows from his early decision to adopt Aristotle as his ontological guide. Had he chosen instead to follow up his genial insight into the primordial nature of the imagination (the insight developed at length in the Kant book and which forms, as it were, the core and the foundation of this unique interpretation) and to pursue this line of thought down the path which it had taken in German Idealism through Fichte to Hegel (the Hegel, say, of the *Anthropology*, which is the text in which Hegel comes closest to something like a *Dasein's* analytic), the primordial conjunction

of feeling and imagination would have brought him much closer to the researches being conducted by such contemporaries as Scheler and Cassirer (and anticipated the researches of a thinker like Michel Henry) and would have made it possible for him to establish a link between his own ontological investigations into the pre-objective, pre-predicative domain and investigations concurrently being undertaken in fields such as psychoanalysis, child psychology, anthropology, mythology and so on.

Instead, he chose to go back to Greek philosophy and, moreover, to that version of it embodied in Aristotle's theory of *praxis*; which led him to the rather strange conclusion that the 'saving grace' (in his early philosophy, the uncovering of an ontological domain against the ontic has something of the character of a 'saving grace') resides in such basic and familiar activities as tool using, driving cars, making use of communications systems; more generally, operating systems (whether mechanical or human) in the manner to which we have become accustomed in our present, technologically oriented, industrialized society. Undeniably, functioning in this practical way does lead to an overcoming of the distance and detachment implied in theorizing. But then the systems in question are all of them systems into which a large component of theoretical reason has already been invested. Worse, they are systems which are both the result of, and which confirm, an attitude of manipulation and control which it was one of the tasks of his later thinking to call in question. As he watched the world being transformed, in a seemingly irreversible manner, through the multiple and apparently limitless applications of science and technology, and as he watched the human and natural destruction which these same applications wreaked upon the face of the earth, it must have become ever clearer to him that the 'saving grace' had become the 'devil incarnate'.¹¹

When the 'saving grace' becomes the 'devil incarnate' a massive adjustment is clearly called for. But it is absolutely characteristic of Heidegger's 'turn' that it should not have taken the form of a renunciation of his earlier position but rather that of a reorientation (see the paper by von Herrmann). The primacy initially accorded to human being (*Dasein*) is never entirely given up, in favour, for instance, of a logic of Being. Rather, the residual persistence of human being is evident in the very terms employed to characterize the new articulation of the Being-relation – as openness, clearing, gift, mittence, en-ownment. *Dasein* is no longer the one who ap-propriates, makes own (see Pöggeler's 'Being as appropriation'). But, as ap-propriated by Being, en-owned, the recipient of the gift of Being, *Dasein* is still there, nevertheless.

But if the initial commitment (which called for this elaborate detour) is not one which we, who follow after, need make, it also follows that the conclusive realignment need not be one with which we have to fall in line. By taking our stand in a reassessment of the full potential of

ontological phenomenology (the field opened up with *Being and Time*), we are free to assume an alternative foundation which will not call for the elaborate 'destruction' which Heidegger performed upon his own earlier thinking, as well as upon the history of philosophy.

But why should one attempt such a reassessment? Obviously, only if it is possible to identify certain striking limitations inherent in the position assumed at the outset. Is it possible to identify such limitations? And if so, how can they be 'overcome' in such a way as to recreate, within the general field of ontological phenomenology, the same latitude (possibility) that Heidegger, the founder of this way of doing phenomenology, claimed for his own enterprise when he placed the possibility of his own (ontological) phenomenology above the actuality of Husserl's (transcendental) phenomenology? Here are some suggestions, suggestions which are by no means intended to be exhaustive.

First, the refusal of Husserl's transcendentalism seems to me not only unjustified, but unnecessary. Heidegger's reaction to Husserl's transcendental phenomenology and his determination to develop phenomenology along alternative, ontological lines led to a situation which Merleau-Ponty, in his Preface to *The Phenomenology of Perception* rather inaccurately portrayed in terms of a *both-and* (both a philosophy of essences and of existence/a philosophy which reduces the world and a philosophy for which the world is always already there/a rigorous science and an interpretation of lived meanings); *inaccurately*, because the very *incompatibility*¹² of Husserlian and Heideggerian phenomenology means that these two ways of doing philosophy can only legitimately be presented in terms of an *either-or*, not a *both-and* – at which point the question necessarily arises: with what right can they *both* then be taken to fall under the same classificatory heading of phenomenology? Is it indeed possible *both* to distinguish and to clearly demarcate the respective spheres of transcendental and ontological phenomenology (and without such a preliminary clearing of the ground, confusion will reign) *and* to reconcile and reintegrate these very different, and indeed incompatible, ways of doing phenomenology?

I believe that a positive answer can be given to this question. Indeed, my own ontological phenomenology is devoted to laying the foundation for just such a task of reintegration. At this point however, it is much more appropriate to consider the problems that arise when a disjunction of the kind indicated above is not resolved. First, as Husserl understood only too well, the replacement of transcendental with ontological phenomenology of the Heideggerian variety carries with it the possibility (if not the necessity) of a depreciation (if not a dismissal) of rationality, both of the philosophical and of the non-philosophical kind. Nowhere is this reservation better expressed than in *Krisis*, that extended cry of pain

emitted by Husserl between 1934 and 1937 as he watched his cherished ideal of rationality fall into the abyss of Nazi irrationalism.

A second conundrum follows hard upon the first, the depreciation, if not the dismissal, of Ethics. Here the classic case in point is Kant rather than Husserl. It is one of the objections brought by Cassirer against Heidegger's Kant interpretation that a strict, and unqualifiedly ontological, interpretation of Kant's transcendental philosophy could not hope to come to terms with the significance of Kant's contribution to Ethics which, as we know, Heidegger himself was inclined to dismiss as a derivative discipline (along with logic, aesthetics, politics and so on).

A third implication follows hard upon the first two, a deeply ambiguous relation to what might be called 'voluntarism'. Perhaps the most critical failing of Heidegger's own critique of the voluntarism inherent in the 'philosophy of subjectivity' is his refusal to recognize the difference (or at least the relevance of the difference) between what might be called 'empirical' and 'transcendental' subjectivity. In as much as Heidegger refused to recognize that, in transcendental philosophy, an alternative conception of subjectivity (inwardness/consciousness) had been developed which already brought with it the 'saving grace' which he was seeking, the grace of a subjectivity which had learnt to 'overcome itself' by taking a further and conclusive 'step back' out of empirical subjectivity and into a sphere variously entitled 'transcendental' or 'noumenal', he was obliged to seek the 'saving grace' in question along other lines, lines leading back to a more primordial relation with Being, and so leading on, inevitably, to a critically ambivalent relation to the 'primitivity' of the 'will to power'. Out of the frying pan into the fire!

A second limitation, or delimitation, one which arises out of the first (the refusal of transcendentalism), is Heidegger's initial (and perhaps also conclusive) commitment to the *finitude* of human being. The Kant book brings out better than any other early text the extent of Heidegger's commitment to this principle. But is it as obvious as some contemporary philosophers would have us believe that this principle is self-evident, or even universally assumed to be such? With the possible exception of a certain interpretation of Buddhism (and such an interpretation is itself highly ambiguous), this assumption implies, even if it does not explicitly avow, a wholesale dismissal of religion as a peculiar, and pathologically engendered, *illusion*, whose survival can only be justified on the grounds that, in some instances at least, it does seem to prompt more considerate *social* behaviour on the part of its members. Precisely because, in the context of an all-pervasive materialism which itself underwrites our contemporary 'faith' in technology, the finitude of human being has virtually taken on the proportions of a self-evident assumption it should surely, today, be subject to the same rigorously critical scrutiny to which the religious thinking of past ages has already been subjected. For with

regard to nothing should philosophy be more critical than toward that which *appears* to be self-evident. For this reason, I am very happy to be able to include two contributions (by Richard Kearney and Joseph O'Leary) in which the theological implications of Heidegger's thinking are explored.

That a rethinking of the relation of philosophy and theology does not need to mean a dismissal of Heidegger's contribution to philosophy is evident in the light of the impact Heidegger's thinking has had upon theology, despite his relative silence on the subject. Rahner, Bultmann and Tillich are the names of just three theologians who have been deeply influenced by Heidegger. To take only the third of these, the starting point of Tillich's *Systematic Theology* is to be located in an interpretation, and theological reorientation, of Heidegger's first philosophy. It is interesting to note that in this, his seminal work, Paul Tillich should have felt obliged to appeal to the Fichtean notion of 'Being itself' in order to accomplish his synthesis of Heideggerian ontology and theology. It is also noteworthy that although Tillich published his *Systematic Theology* late enough (1951) to be able to take account of the *Kehre* (and some at least of its theological implications), he chose to go back to Heidegger's first philosophy for his philosophical grounding.

A third limitation can be identified in Heidegger's refusal to countenance any attempt to make the connection between ontological phenomenology and other relevant branches of the human sciences. I say 'refusal' not 'failure' because, on several occasions, he does explicitly *refuse* to make this connection despite its obvious relevance to the directives of primordially. And yet, in his study of Heidegger's theory of being-with (*Der Andere*), Theunissen will talk of an 'anthropological turn'.¹³ And with some justification. For, towards the end of his Kant book, Heidegger does talk of the laying of the foundations of metaphysics as 'philosophical anthropology'.

And so on to psychology. In his paper on the psychological implications of Heidegger's ontology (see chap. 60, vol. IV of the present work), Charles Scott shows how fruitful Heidegger's thinking has also proved to be for such psychoanalysts as Medard Boss and Binswanger. Merleau-Ponty's own investigation of the being-in-the-world of human being not only relies heavily upon the findings of behavioural psychology but is obliged to do so in so far as the being of human being is now determined in accordance with the fundamental principle of embodiment – as Christina Schües' paper shows. To these two instances, it would be appropriate to add a third, the opening up of the whole field of child psychology, primarily through the work of Jean Piaget but also through the labours of researchers such as Anna Freud and Melanie Klein. Moreover, this concern with the primary in connection with the psyche readily leads on, and especially through the work of Carl Jung, to a more general reassess-

ment of human spirituality – for instance, as exhibited and attested in the discipline of mythology. In this last connection I would mention especially Eric Neumann and the Swiss cultural anthropologist, Jean Gebser.

If the direction of Heidegger's first philosophy is regressive (and this directive is, to some extent, maintained throughout the course of his development), a movement from the derivative to the primary, from the grounded to the grounding, from the outcome to the outset, then surely, those branches of the humanities which are concerned with precisely this domain (of the primordial) *must* have a bearing upon the ontological revolution introduced by Heidegger into phenomenology? In this connection, I would strongly recommend the current work of Hermann Schmitz, whose ten-volume *System der Philosophie*¹⁴ is full of insights gleaned from a careful consideration of empirical research bearing upon human reality.

Thus far, we have taken into consideration only those delimitations which refer to possible ways of doing (or of orienting) phenomenology which Heidegger *explicitly* took account of in order precisely to be able to discount them. Two further limitations deserve to be mentioned, limitations which refer to ways of doing philosophy which Heidegger never himself seriously entertained and which, for this reason, remain excluded from the province of *his* consideration: analytic philosophy, on the one hand, and Eastern philosophy, on the other.

Heidegger's refusal of analytic philosophy, in particular, or the philosophy of the English-speaking world, in general, was, though rarely referred to, quite deliberate. In his *Introduction to Metaphysics*, in one of those rare passages in which he talks of the forgetfulness of being in terms of the emasculation of spirit, of a spiritlessness engendered by a utilitarian intelligence which skims over the surface of things, Heidegger lumps America (by implication the Anglo-Saxon world) and Russia together as the enemies of a spirituality whose high point is to be located in German Idealism.¹⁵ But a case for the exact opposite position can readily be made, as we all know, from the example of Karl Popper whose intellectual career encompasses a massive attack (to my mind, by no means as convincing or as conclusive as it appears) on German Idealism (*The Open Society and its Enemies* and *The Poverty of Historicism*) as the most important source (traceable to its roots in Platonism) of totalitarianism.¹⁶

More generally, I think it is appropriate to point out that the 'spirit' in which analytic philosophy is conducted is, in certain respects, 'healthier' than that which prevails in continental philosophy. In analytical circles there is no such thing as an unassailable theory or an unassailable theorist. Rather the contrary, progress in the field is measured by a procedure of 'challenge and response' from which no one is exempt and

from which no one can withdraw, without discredit, into genial immunity. Admittedly, the cut and thrust of analytical philosophy has much to do with a somewhat naive, because epistemologically biased, criterion of validity and with a marked reluctance to attempt anything like the elaboration of a complete philosophy. For all that, Heidegger's dismissal of the epistemological concept of truth does not merely reduce the scope of his theory, it confuses the issue in so far as it leads to an (ontological) extension which borrows much of its conviction from that which it seeks to surpass – as Tugendhat has shown.

Finally, Heidegger's determination to think the meaning of being strictly out of the Western tradition, beginning with the Greeks, deliberately overlooks the more original contribution of Eastern philosophy. Greek culture was not, in fact, the beginning of philosophical culture here on earth. Long, long before the Greeks came the Indians – and possibly also the Chinese. It is indeed astonishing that of all the great Western philosophers only one, Arthur Schopenhauer, should have shown a proper appreciation of the indispensable significance of Eastern philosophy – in his case, Indian philosophy. It should however be said that although Heidegger never sought to directly address (let alone assimilate) Eastern philosophy as such, he did at various points enter into a dialogue with Japanese philosophers, a subsidiary connection which I have been fortunate enough to be able to follow up through the good offices of Graham Parkes, the editor of a volume on *Heidegger and Asian Thought*.¹⁷

But, it will be objected, this attempt to recuperate, with a view to further developing, the general field opened up by Heidegger's ontological phenomenology only means that one has not read, marked, learnt and inwardly digested the implications of his later philosophy, that one has not come to terms with the claim, as it is so often voiced, 'that the only question which philosophers are permitted to address today is the question of the "closure" or "end" of philosophy'.

First, as Samuel IJsseling's paper reminds us, the so-called 'end of philosophy' is not an end *tout court* but is also the 'commencement' of something else which Heidegger called 'thinking'. But second, it seems doubtful to me that it is possible *for us* to start out where Heidegger left off, with the thinking that came after the *Kehre*. The very fact that the *Kehre* took place, in part, as an auto-critical reaction means not only that we have grounds (furnished by Heidegger himself) for being wary of Heidegger's own starting point but also grounds for thinking that what follows the *Kehre* cannot itself, and without further qualification, form a starting point for the development of any further thinking about Being, at least not unless, and until, we too have made our own move 'through phenomenology to thought'. The more I read the productions of those who have taken late Heidegger as their point of departure, the more

convinced I become that it is not possible to start out from the *Kehre* without the risk of lapsing into arbitrariness and unassailable, because inaccessible, idiosyncrasy.

'By their fruits ye shall know them.' Thinkers who have returned to the source from which Heidegger originally drew his inspiration have taken Heidegger at his word and produced phenomenological programmes of their own inspired by the Heideggerian example, have proved to be amongst the most fruitful thinkers of our time, even when the course of their thinking has adopted a very different trajectory. The two figures who spring most immediately to mind are, of course, Merleau-Ponty, whose own concept of being-in-the-world (partly inspired by Husserl) led him towards an investigation of embodiment, and Sartre, whose dualistic ontology (harking back to Descartes) permitted him to offer a graphic portrait of the existential implications of alienation. But there are others. In his seminal work, *Essence of Manifestation*, Michel Henry chose to suspend the primacy accorded to transcendence in the Heideggerian ontology and so found himself in a position to work out the implications of an *ontology of immanence*. In his massive, ten-volume work, *System der Philosophie*, Hermann Schmitz chose to suspend the primacy accorded to the future in the Heideggerian ontology and so found himself in a position to work out the implications of an ontology whose existential watchword might be: live more presently! Emmanuel Lévinas not only refuses the subordination of ethics to ontology (as Jean Greisch point out in his paper) but chooses to radicalize the alterity of the other with a view to promoting a sense of the irreducibility of personal relations. With regard to the many topics with which his thinking has come to terms, Professor Ricoeur has never ceased to hold in tension the three (for him mutually supportive), parameters of empirical investigation, transcendental critique and hermeneutical interpretation.

How one thinks is in part determined by what gives itself, at any given time, as having to be thought – the gift of being, the offer of which, Heidegger said later, would depend upon being, not upon us. But surely, of one thing we may be fairly certain. There will be no lack of themes in the years to come. To take only one example; from the very earliest times, and certainly before Plato, the word 'being' has been linked with that of the 'One' or unity. But never before has unity meant what it is coming to mean today, the global unification of the human species under the compulsive thrust of contemporary technology. Epictetus already talked of himself as a 'citizen of the world', but largely on the *tragic* grounds of his own uprootedness and enslavement. Today, we see the unity of the globe through satellite pictures beamed down from space. Corporate capitalism thinks of the world as a whole and already operates on a global basis, regardless of national frontiers. In fact, these frontiers are becoming ever less viable, whether they are dissolved through

agreement (the European Community) or forcibly overridden (the contemporary reaction against communist domination in Eastern Europe/the black revolt in South Africa).

The unification of the world is not however likely to proceed smoothly. In fact, I suspect that the next decades will prove to be amongst the most turbulent the world has ever seen. Momentarily, we are congratulating ourselves on the suspension of the Cold War. But this suspension can always itself be suspended. More realistically, the proliferation of nuclear weapons throughout the Third World makes it likely that a nuclear confrontation of some kind is going to take place before very long. In the meantime, the apparent withdrawal of the threat of world war is matched by an equally apparent advance in the scope and scale of local wars, wars whose barbarism surpasses that of the world wars themselves. Countries which, like Peru or Mexico, were historically (the Inca and Aztec empires) always able to feed their people adequately are now unable to provide for a rapidly increasing population despite the resources of agricultural technology (or perhaps because of them). Famine on a scale never before known faces Africa, and epidemics on a scale rarely seen before now confront not only the undeveloped world but its fully industrialized leaders. And even if all these dangers are overcome, or circumvented, by the intelligent use of technology, this very technology threatens to bring with it an environmental destruction for which there exists no parallel in past history.

The times ahead are going to be turbulent and, for this very reason, dangerous times. In times of danger, Nietzsche claimed, philosophers are needed. But surely not to debate the question of the 'end' or the 'closure' of philosophy, or to indulge in meta-theoretical assessments of the actual situation in the discipline, still less to fall back upon a scholarly examination, or critical deconstruction, of the texts which go to make up what has come to be known as the history of philosophy. Is this not the very moment to revive the time-honoured slogan: *To the things themselves!* The endless discussion of the 'end of philosophy' at a time when philosophers are needed to address the very real dangers that face humanity today seems to me one of the strangest acts of professional irresponsibility since Nero fiddled while Rome burnt.

15 Heidegger, *GA* 40, pp. 37–9.

16 Popper's attack on German Idealism is much more puzzling than it appears. For if he was concerned to expose the philosophical sources of authoritarianism why did he not take account of Hobbes' *Leviathan*, one of the most unabashed defences of dictatorial rule ever put together by a philosopher? Could it have been because the audience for which he intended his anti-totalitarian diatribe was largely British? In which case one would have grounds for querying the genuineness of his moral crusade.

The beginning and the end of philosophy

Hans-Georg Gadamer

Heidegger's influence has always been linked up with well-founded and entirely intelligible countervailing forces. This has to be understood from the very beginning if we are to come to terms with Heidegger's talk about the end of philosophy and the commencement of thinking. The first major objection which can be brought against Heidegger is, of course, his relation to logic. This is not so much a matter of logic having made astonishing progress in the last decades while Heidegger, as with all those of my generation, was brought up on the old Aristotelian school logic. It is a matter of a deeper conflict which not only concerns Heidegger but continental philosophy in general. It is for instance always possible to tear apart statements by Heidegger in the manner we have become familiar with through Rudolf Carnap. In a paper which has become very well known, Carnap dismantled Heidegger's inaugural lecture at Freiburg entitled 'Was ist Metaphysik?' by a scrupulous application of the logical rules of the game. In that text Heidegger speaks openly of an annihilation of nothingness. If one sets out with Carnap to write this statement on the board, using for the purpose the instruments of mathematical logic, it becomes perfectly clear that it doesn't work. In this formal language in which everything is supposed to have an unambiguous meaning, no symbol can be found for 'nothingness'. One only finds a symbol for the negation of an expression. Heidegger's talk thereby becomes an inaccessible mystification. From the standpoint of predicative logic, an objection of this kind may very well be legitimate. But what then becomes of philosophy?

In the eyes of modern logic, Hegel is just as badly off. And what about the dark Heraclitus? We will have to ask ourselves what philosophical discourse is and with what right it can claim to flout the laws of predicative logic. Furthermore, this holds not only of philosophical discourse but of any form of inter-human discourse which falls under the

aegis of rhetoric. So it remains a matter of the primary importance for philosophy to determine why that which is allowed by language and forbidden by logic cannot simply be put down to feeling or to a poetic game, as Carnap surmised.

The second objection, which goes together with the specific theme of the commencement of philosophy, comes from the side of philology. We will find it difficult to rule out as unjustified the complaint brought by classical philosophy (to which I belong to some degree) against the violence of Heidegger's interpretations or even the incorrectness of certain of his interpretative strategies. We shall have to ask ourselves whether, for this reason, we can claim the right to overlook this great thinker or whether, on the contrary, we might ourselves be missing something important when we close ourselves off from Heidegger on account of the unwelcome impact of his thinking.

The third objection is that of science. On the one hand, we have the social scientists, who find that their field has been ignored by Heidegger or at least only addressed in piecemeal form. To dismiss 'society' as *das Man* is for them unwarranted. On the other hand, we have the natural sciences, who cannot understand what Heidegger means when he says 'there is no thinking in the sciences'. But perhaps such a claim demands thinking of a quite different kind from that of the empirical sciences.

All this can be summed up in the ruling prejudice to the effect that what Heidegger has to say after *Being and Time* is no longer provable, is a kind of poetry, or better still a pseudo-mythical thinking. Here we find Being talked about in such a way that 'it gives', that 'it sends', that 'it reaches'; goodness knows what else is said of this mysterious something which is Being. Relative to the annihilating nothing of the Freiburg inaugural lecture to which Carnap took exception, this is something different again, by comparison with which the above-mentioned 'nothingness' indeed appears almost harmless. We come up against a question here which cannot be so easily evaded and which, in particular, requires that we take account of the role that art, and above all Hölderlin's poetry, took on in the thinking of late Heidegger.

If I mention these objections brought against Heidegger in an introductory way, it is in order to make room for the comprehensive urgency of the theme in question. This is a question which has to be posed by our civilization. Brought into being by the West, it has nevertheless spread its net over the greater part of the world. It concerns the world view which lies at the root of science and scientific theorizing, a world view which is characteristic of our epoch. The inner drive towards 'progress' which lurks therein is slowly beginning to exert its influence as something that merits attention. It was forty years ago that Heidegger wrote his paper on the end of philosophy, and this paper reads today as though he had come to grips with precisely what has preoccupied us everywhere

in the meantime. Thus the topic of this paper, 'The beginning and the end of philosophy' is something that refers back to Heidegger's work. What does it mean to say that philosophy is at an end and that, at best, it has been dissolved into a number of specialized disciplines, disciplines which will perhaps be tolerated alongside the other sciences within the complex of our scientific culture? What contemporary trend is it that is being described with the formula: The End of Philosophy?

To be sure, this does not mean that nothing else is effective except the technological frenzy. When Heidegger talks of the end of philosophy, we all understand what he means. For this way of talking can only proceed from the West. In other parts of the world, philosophy was never set off so dramatically against poetry or religion, not in East Asia, nor in India, still less in the less well-known parts of the earth. 'Philosophy' is an expression of our *Western* destiny. To speak with Heidegger: an *ontological* destiny which, as a matter of fact, has become our fatality. Contemporary civilization strives to fulfil this destiny, or so it seems, a destiny which will bring the whole of humanity under the sway of the industrial revolution. Whether the latter is linked to this or that economy plays a subordinate role. A centralized economy, like that of the Russian five-year plan, seems to be extraordinarily similar to our own in its subjection to the necessities of capitalistic society. If we are hearing talk of the end of philosophy this has to be understood along the above-mentioned lines. We are becoming conscious of the fact that the distinction between religion, art and philosophy and perhaps also the distinction of science and philosophy, is not the same for all cultures but rather places its stamp upon the particular history of the Western world. One is forced to ask: what kind of a destiny is that? Where does it come from? How did it come about that technology was ever able to exert so autonomous a sway that it has today become the distinguishing mark of human culture? If we pose questions such as these, Heidegger's at first sight surprising and paradoxical thesis sounds, all of a sudden, astonishingly plausible; that it is Greek science and metaphysics the outcome of which has commanded the emergence of present-day world civilization.

To be sure, by comparison with earlier epochs, the technical civilization of today imparts a different stamp upon our history. In a well-known paper on technology, Heidegger himself admitted that technology does not represent the simple extension of a once-familiar handicrafts culture or even the perfecting of instrumental reason but has rigidified into a self-sufficient system.

Heidegger thought about this system under the provocative aegis of the name *das Gestell* (the frame or the set-up) – a truly Heideggerian concept. We will have to talk later about Heidegger's tendency to devise new concepts. But in order to get closer to the concept of *das Gestell*, one has only to think about a familiar application of the word. We talk,

for example, of the signal-box. That is, the regulative installation in every station which directs the tracks into the different platforms. From this standpoint, anyone can understand Heidegger's concept. *Das Gestell* is a key concept, the sum of such setting-up and directing, such ordering and securing. Heidegger has shown convincingly that we are confronted here with an all-determining thought structure which is by no means restricted to the industrial economy in the narrow sense. His thesis is that philosophy is coming to an end because our thinking takes place under the final direction of the *Gestell*.

Now Heidegger asks: where does all this come from? What is the beginning of this history? Obviously, the beginning is not to be located at the point where modern science becomes more and more dependent upon technological progress. Rather, modern science is itself already technology. This means that its relationship to natural entities is an assault which aims at breaking down a resistance. In this sense science is aggressive in that it compels entities to respond to the conditions of 'objective' knowledge, and this whether these entities are natural or social in character. To take an example with which we are all familiar because we belong to society: the questionnaire. The questionnaire is a document which attests to the fact that questions are forcibly demanded of one, questions which one is supposed to answer. Whether one does or does not want to answer, whether one can or cannot answer responsibly, we are nevertheless obliged to respond in the name of science. Social science needs its statistics just as natural science applies its quantitative methods to nature. In both cases it is the predominance of a method which defines what is scientific and worthy of scientific investigation, which means that what is to count as knowledge is controllable. No matter how complex and elaborate the concepts developed by scientific theorizing, it cannot be denied that the great breakthrough of the seventeenth century is still operative today. It emerged initially out of the physics of Galileo and Huygens and found its first fundamental articulation in Descartes' reflections. It is well known how the West managed to 'demystify the world' as a result of this breakthrough in modern science. The industrial exploitation of scientific research eventually made it possible for the West to emerge as the dominant planetary power by installing an all-powerful economic and communications system. But that was not the first beginning.

There is an older, so to speak, first wave of 'enlightenment' through which science and scientific research developed the world – and that is the beginning which Heidegger has in mind and which is always at the back of his mind when he speaks of the end of philosophy. This is the Greek discovery of *theoria*. Heidegger's provocative thesis is that this beginning of scientific enlightenment is the true beginning of metaphysics. To be sure, modern science arose as a result of a conflict with

'metaphysics', but is it not, for all that, a consequence of Greek physics and metaphysics? In this way Heidegger posed a question which has preoccupied modern thought for a long time. It can be illustrated with reference to a particular, well-known case. At the beginning of modern science in the seventeenth century, philosophers turned to the least well-known of the great Greek thinkers, Democritus. This led to Democritus being set up as our great predecessor, especially in the nineteenth century when the victory of modern science had taken hold of consciousness in general, a predecessor moreover who had been overshadowed by the obfuscating style of a Plato or an Aristotle. And so Heidegger was able to pose the question of our Greek origins in a much more radical fashion. He uncovered a deeper continuity in Western history which was initiated earlier and persists until today. This tradition led to the splitting up of religion, art and science and even survived the radicality of the European Enlightenment. How did Europe get on to this path? What is this path? How did it begin and how did it go on, until it finally found its most dramatic expression in Heidegger's *Holzwege*?

There can be no doubt that this development goes together with what in Germany is called a *Begriff* (concept). To say what a *Begriff* is seems almost as difficult as it was for Augustine to say in what time consists. We all know the answer and still cannot say in what it really consists. When it is a question of a *Begriff*, words always betray us. In a *Begriff* something is grasped together (*zusammengegriffen*), put together. In the very word *Begriff*, we find it implied that a *Begriff* apprehends (*zugreift*), comprehends (*zusammengreift*) and so conceives (*begreift*). Thinking in *Begriffen* (concepts) is therefore an actively appropriating (*eingreifendes*) and expropriating (*ausgreifendes*) thinking. Thus Heidegger grasped the history of metaphysics as the expression of an original Greek experience of Being, and moreover as that development of our experience of thinking which grasps beings in their Being, so that one can get a grip on it and, to this extent, hold it in one's possession. His formulation of the task of metaphysics thereby becomes one of grasping beings, as such, in their beingness. This is the definition, the *Horismos*, through which what is gets conceptualized. That was the genial achievement of metaphysics and not just a deviation from the straight and narrow path which the ancient atomistic philosophy was supposedly pursuing. It was the transfer of Greek metaphysical thought to Rome and so into the Christian Middle Ages which finally led to the emergence of the modern epoch with its humanistic renewal of the Greek tradition. This is a long story. Since I am also acting here in the role of an eye-witness, I should give notice that, by 1923, Heidegger had already described the modern epoch as the 'concern with indubitable knowledge'. This still unknown literary formula from Heidegger means that the truth (*Veritas*) has been suppressed by certainty (*Certitude*). It is, so to speak, the moral of this method that

small, even if modest, steps are to be preferred, provided only that they are absolutely controllable and certain. One sees how the Anglo-Saxon analytical philosophy of today has remained truer to this scientific moral than Hegel or Heidegger himself. Heidegger's claim, a claim which he advanced with the whole weight of his imaginatively rich thinking, is simply that of having clarified the destinal unity of Western history, a history which began with Greek metaphysics and which has ended in the total domination of industry and technology.

A claim of this kind implied the need to go back behind propositional logic. It is very difficult to accomplish this so long as philosophy remains in competition with religion and art and poses questions which cannot be avoided but for which, nevertheless, there exist no demonstrable answers, for example, the question: 'what was there in the beginning?' The physicists cannot ask questions of this kind. If we ask them what there was before the Big Bang, they can only smile. From their own scientific standpoint, it becomes meaningless to ask such questions.

In spite of that, we all do this. We are all of us philosophers, bent upon asking questions even where there is no answer, or even where there is no clear way of arriving at an answer. This is what I meant when I talked about going back behind propositional logic. A going back behind what can be formulated in valid propositions. Such a going back has nothing to do with logic itself, with its validity and its indubitability. It does however have something to do with the fact that this monologically consequential argumentative procedure is incapable of laying to rest our imaginatively questioning thinking. The step back which takes place in such questions goes back not only behind the proposition to what we cannot avoid going on to question in everyday life; it even goes back beyond what we are able to ask and to say in our language. We continually find ourselves caught in a tension between what we are trying to say and what we are not really entitled to say. This is a constitutive linguistic need which pertains to humankind and which is assumed by every genuine thinker who, as such, finds himself unable to forgo the rigours of the concept (*Begriff*).

Language was not made for philosophy. So philosophy has to take words out of the language in which we live and confer upon such words a quite peculiar meaning. This results in artificial constructions which, in an ever-extending collegiate culture, lapse more and more into ghostly symbols behind which it is no longer possible to glimpse any hint of a living linguistic intuition. What follows therefrom is that tendency to *Falling* which Heidegger identified in *Being and Time*, a tendency which pertains to human existence as such. We make use of forms and norms, schools and institutions without thinking about them in an original way.

In our modern scientific age a new task arises, a task of a kind German Idealism was already familiar with but only resolved in part. I learnt

how to conceptualize this task from Heidegger. It consists in becoming conscious of the concepts which one employs to think. Where do such concepts come from? What do they contain? What is unintended and unconscious in such concepts when, for example, I use the word 'subject'? Subject is the same as substance. Subject and substance are both of them confirmations of the Aristotelian expression *Hypokeimenon*, which means 'foundation'. This Greek concept has admittedly nothing to do with the thinking 'I'. We readily and quite self-evidently (even if we underestimate what is at stake) speak of a fatal subject. We also, as 'philosophers', speak (with nervous overestimation) of the transcendental subject in which all objects of knowledge are constituted. How far philosophical concepts have been detached from their original usage! This is the task the young Heidegger resolutely set himself when he set about the destruction of the metaphysical conceptual tradition. Within the limits of what we are capable of, we have learnt from him how to work our way back along the path from the concept to the word, not however with a view to giving up conceptual thinking, but in order to restore to it its intuitional potential. In doing this we are doing no more than was done by the Greeks before us and, in particular, we are following Aristotle who, in Book Delta of his *Metaphysics*, set about the analysis of fundamental concepts and sought to build up their multiple meanings from ordinary linguistic usage. In other words, it is a question of reopening the way from the concept to the word, so that thinking speaks once again. Given the burden of a two thousand-year intellectual tradition, this is no mean task. It is very difficult to draw the boundary between a concept that has been developed with some precision and a word which lives in speech. We are all taken in by a conceptual terminology which stems from the metaphysical tradition and which lives on unthinkingly in thought. Heidegger had to make use of an extraordinary linguistic facility in order to make the language of philosophy speak again. Such an undertaking brings a great deal back to life. Indeed, a great deal still waits to be done along these lines, above all, an assessment of the Christian mysticism of a Meister Eckhart, Luther's bible and the expressive power of those modes of speech which have remained inaccessiblely ensconced in a discourse which employs picture language.

What was new about Heidegger was that he not only disposed of an extensive linguistic mastery, as did the shoe-maker Jacob Böhme, but that he also commanded that entire Latin School tradition which belongs to our conceptual language and, moreover, broke through this tradition by going back to its Greek origins. In this way he succeeded in rediscovering the intuitive word which lurked in the concept. This was his special contribution from the very beginning. By this we do not mean to deny that the development of a concept makes it necessary, in the interests of unequivocal definition, to reject some of the implications that have

accumulated in the course of its history. Even Aristotle did this. Similarly, it was a new Aristotle, an Aristotle with a new voice who, in the person of Heidegger, and from the time of his writings on the *Rhetoric* and on the *Ethics*, threw a new light upon metaphysics by going back beyond the neo-scholastic and Thomistic conceptual language and Aristotle interpretations. And so, in the end, it becomes understandable that, when one evokes a linguistic potential whose meaning cannot be written up on the board, one is not indulging in poetry or day-dreaming.

The potential inherent in language should serve the cause of thinking. This means that a concept should finally capture the meanings disclosed in a word through analysis. The analysis of a concept will distinguish a multiplicity of meanings all of which are operative in speech but which at the same time are restricted to a specific determination in any given discursive context, so that, in the end, one meaning takes the lead while the others are, at best, simply implied along with it in an auxiliary way. This is the thinking use of words. It is slightly different in poetry but not very different. Here it is also a matter of establishing the regulative meaning of a word so broadly that a meaningful unity emerges in poetic diction. Indeed, it is precisely through the ambiguity and multiplicity of meaning which words possess that language comes to acquire a depth. This can also happen in philosophy. The conventionally established univocity of an expression which, in itself, possesses several meanings, can let the other meanings which lurk in a word be articulated along with the former, and this can be carried so far that thinking can be thrown out of its habitual tracks. Heidegger often did this deliberately. He even called this the 'leap' (*Sprung*): thinking must, so to speak, be compelled to leap, in as much as the subordinate meanings of words or sentences are emphasized until they fall into explicit contradiction with the former. This can be of the first importance in a philosophical discussion as, for example, when a habitual meaning acquires an entirely new meaning through the multivocity of the word with which it is associated. Thus when Heidegger posed the question: 'Was heißt Denken?' he did not pose it in the conventional sense of *heißt*, where it means 'mean' but with an unexpected twist which brought out the subordinate meaning of *heißt* as 'offer'. This procedure should not be imitated even though, with Heidegger, it is always worth taking the new direction. Another example: in Heidegger's paper on technology, there is an explanation of causality and origin. Heidegger says there: in truth there is a rationale (*Veranlassung*). In connection with his presentation one suddenly becomes aware of what *Veranlassung* can mean. One discovers that a *Lassen* lurks therein. To bring something out (*Anhebenlassen*) always includes the implication that one lets it be (*läßt*). This is the kind of way in which Heidegger will encumber a normal German word so that it begins to say

something different. In this case, it says: something is allowed to be in its being, and in such a way that it stands out.

To be sure, when it is a matter of texts, trafficking with language in this way implies, in a certain sense, selling out the text. The text has its unitary intention even if the latter is not necessarily a conscious intention on the part of its author. In any case the recipient, the decipherer, is directed to what the text means. It is clear that Heidegger sometimes stands the underlying intention of a statement on its head. The word suddenly transgresses the normal ranges of its application and thereby begins to render visible what was not originally thought. Heidegger often mobilized etymology in this way. To be sure, if one appeals to scientific etymology in this fashion, one becomes dependent upon an ever-changing procedure of scientific validation. In such cases, etymology begins to lose its conviction. In other cases, on the other hand, etymology can bring to light what is implicit in our feeling for language and so confer confirmation and plausibility upon it. In such cases, Heidegger does succeed in tracing words back to the original experience from which they sprang.

In any case, it is clearly not so much a matter of statements as of words whose meaning potential can be recognized and brought to expression. Such a procedure has its precursors, above all Aristotle. The best known example is the Greek word for Being, *Ousia*, which acquired the meaning of *essentia* in Latinized metaphysics. This was the translation of *Ousia* which was taken over from Cicero. But what did this word mean in the spoken Greek of that time? In German we are well equipped to reproduce the configuration. *Ousia* means *das Anwesen*, the lie of the land, as we still say, a house or an individual domain. A farmer can say of his property: 'it's an attractive prospect [*Anwesen*].' The Greeks could say this too and they can still say it today. Those who know Athens well will appreciate the following confirmation. After the exodus of Greeks from the Middle East at the beginning of the twenties, the former Athens was increased by about one million refugees and spread out into the countryside. But everyone was housed in their own little property. So everyone still had his *Anwesen*, his spread. So that which as *Ousia* made up the Being of beings is still preserved in an actual intuition. The *Anwesen* is what is there and so makes up the essence (*Wesen*) of country living. He is in his own *Oikos*, his own domain, conscious of his own being, so to speak, and is so still. And so the word *Ousia* shows us that the genuine conceptual meaning can be clarified in the light of the original meaning of the word.

If one is aware of the entire verbal configuration consisting of *ousia*, *parousia*, *apousia*, one cannot but find Heidegger's employment of the concept *Vorhandenheit* unsatisfactory. I do not have a better proposal, but in the expression *Vorhandenheit* one is either too influenced by the connotation of simple existence in the sense of *existentia* as that term

was used in the School philosophy of the eighteenth century (which then takes the concept in the direction of the conceptual complex which belongs to modern experimental science), or else one is forced to rely on common parlance which, in any translation of the term into a foreign language, then makes it almost impossible to distinguish *vorhanden* from *zuhanden*. Neither of these two senses is to be found in the concept of *Anwesen*, which means something completely different from any existence of the object which is susceptible to weights and measures but which, nevertheless, cannot be assimilated to any behaviourally directed *procheiron*. In any case, when Heidegger decided on the expression *Vorhandenheit*, he neglected the difference between the understanding of being which belongs to modern natural science and that which pertains to the Greek Meta-‘Physik’, and therewith made it difficult to capture the presence of the divine in ‘Being’. This is what happens when one tries to let words speak – the attempt sometimes by-passes the genuine conceptual intention. From Heidegger one can learn both the risks and the opportunities which attach to using language in a new way.

Especially instructive is Heidegger’s translation of *Aletheia* as unhiddenness (*Unverborgenheit*). Greek usage would actually have made it more acceptable to say ‘unconcealedness’ (*Unverhohlenheit*). This is also how Humboldt translated it. When Heidegger thought of it as unhiddenness he was being true to his own vision, which carried his reflections back to the ever dimmer, because ever earlier, origins of Greek literary testimony. Hiddenness speaks in unhiddenness. In this way an association is brought to light which Heidegger wanted to release and whose content we are now in a position to grasp. In unhiddenness a suspension of ‘withdrawal’ (*Geborgenheit*) can also be found. What emerges through speech and reflection and so presents itself is precisely what lies buried (*geborgen*) in words and perhaps remains buried even if something of it is brought out, is unearthed (*entborgen*). We find lurking here in Heidegger’s conceptual ambitions the experience of Being as the counter-play of revealing (*Entbergung*) and concealing (*Verbergung*).

What follows from all this for language in philosophical thinking? Can we not glimpse herein the secret of the word, and even more, of the word-concept, namely, that it not only refers to something else in the manner of a sign but burrows ever deeper into itself? It pertains to the very nature of signs that they should refer away from themselves. It is quite an achievement to be able to understand even signs as signs. Dogs can’t do it. They don’t look there, where one is pointing but snap at the finger that points. We are already thinkers even when we only understand signs. How much more so is this the case when we understand words? This holds not only of the understanding of individual words but of how they are spoken in the unity of a melodic flux of speech which acquires its capacity to convince from the articulation of the whole discourse. They

always stand in the connections established by discourse, and discussing is not just a running-through of a complex of meaning-bearing words. It suffices to consider the vacuity of those illustrative phrases we find in a good foreign grammar book. They are intended to be empty of meaning, so that one will not be distracted by their content but attracted to them as words. This is not genuine discourse. A language is used to speak to someone and speaks through the tone in which it is voiced. And so we find genuine and specious tones, ways of talking which are convincing and which are unconvincing, true or false – and much of this is not dragged up out of concealedness and re-presented in language.

Heidegger also sought out an etymology for the word *Logos*. He held it to be the *legende Lese*. When I read this for the first time, I disapproved, found it a forced reading of the hidden meaning of the word. But it began to take hold nevertheless. For if one follows the unearthing of the semantic field which is in question here and then goes back to the well-known concept *Logos*, one finds this background working its way back into one's own intellectual and linguistic intuitions about the *Logos*. And so I would like to make the following avowal: the *Logos* is the *lesende Lege*. *Legein* means read, read together (*zusammenlesen*) and so bring together (*zusammenlegen*), so that it is brought together and gathered in as a harvest, like grapes from the vine. So what is brought together in the unity of the vintage (*Lese*) are not merely words which make up sentences. It is the very word itself, a word in which a multiplicity is brought together into the unity of the *Eidos*, as Plato will say.

This issue is of special significance in connection with Heraclitus. Heraclitus was for Heidegger the most attractive of all the early Greek thinkers. His sentences are like riddles, his words like hints. In Heidegger's little hut over Todtnauberg, we find etched into the bark of the door the inscription: 'Lightning steers everything'. In Greek of course. In this statement, as a matter of fact, Heidegger's basic vision is to be found, namely, that what is present is brought out in its presentness in the lightning stroke; for a moment everything is as clear as day, but only in order to sink back suddenly into the darkest night. This instant in which the 'present' is there was disclosed by Heidegger as the Greek experience of Being. This lightning stroke which allows everything to manifest itself at one blow is preserved as present for a short while. One can understand why Heidegger was so fond of Heraclitus' sayings. Here we find an entire statement which lets the belonging-together of uncovering and covering over become apparent as the basic experience of Being. Truly, what is brought to words here is a basic human experience. For we live in the knowledge that even the absent is present, *nooi* (in spirit). All thinking is like a streaming out and a projection out beyond the limits of our brief existence. We are, so to speak, unable to recognize – and can never

really forget – that it only lasts for a while, until the infinitude of spirit is limited by the finitude of death. Again, Heidegger gives expression to his experience in a quite simple word: 'It gives'. What is this *It* which gives here? And what does it *give*? All this swims in an unclarified haze and yet everyone understands perfectly well what is meant. '*This* is it. *It* is this.' Heidegger did no more than find words for this straightforward expression.

To be sure, the colossal task of thought consists in trying to preserve, to incorporate in words, in readily accessible discourse, this lightning stroke in which everything suddenly becomes clear. One day I was with Heidegger up in the hut. He read me a work by Nietzsche, which he happened to be writing about at the time. After a few minutes he interrupted himself, bringing his hand down on the table, so hard that the teacups rattled, and cried out in despair: 'This is all Chinese.' This was certainly not the manner of someone who wanted to be dark and difficult. Clearly Heidegger suffered from the need to find words which could move out beyond the language of metaphysics. How is the wholeness of a vision to be elicited from the dazzling clarity in which the lightning stroke shatters the night? How can a sequence of thoughts be put together in which words yield a new mode of discourse?

What are we to think, for example, of the 'ontological difference'? It is still for the most part being misunderstood as though someone – we – made this difference. This is quite out of the question. The ontological difference is the outcome which emerges from Being itself and which makes it possible for us to think. This is what will be at issue later and what is certainly stated in the perspective of the *Kehre*, or the 'Turn'. But if I may be permitted once again to draw upon my fund of knowledge as a contemporary witness I would like to report that in 1924, as Gerhard Krüger and I accompanied Heidegger back to his first Marburg home after the conference and asked him about the ontological difference, he definitely rejected the idea that it might be we ourselves who make this difference. One sees then that the *Kehre* came before the '*Kehre*'. Further, 1924 was not the moment of its first appearance. While I was still a student, at the beginning of the 1920s, we heard in Marburg that the young Heidegger had said in a lecture: 'It worlds.' This was really the *Kehre* before the '*Kehre*'.

One final question: how, in the perspective of the later Heidegger, are we to think the experience of death, an experience which in *Being and Time*, and in the context of his analysis of anxiety is so flexibly developed? How can the duality of covering and uncovering be thought? As the 'range' (*Gebirg*) in which death is buried? Is that not a way of talking about death which is reproduced in every human culture? Even where something like an after-life religion is installed? Certainly the description given in *Being and Time* is one which is drawn from Christian

sources. Our Western way of thinking is certainly not the only way of thinking about the experience of death. Other after-life religions, for example Islam, seem to think differently. Did the later Heidegger think his way out beyond his own Christian experience? Perhaps. In any case, he certainly thought his way back to its Greek origins. If one has not come to terms with the meaning of this Greek origin for Heidegger, it becomes virtually impossible to understand late Heidegger. This is not because of Heidegger himself but because of what we mean by philosophy and what our culture has demonstrated along the way to knowledge. We are still determined by this tradition and must allow ourselves to be empowered by it to ever new possibilities of thinking.

And in the meantime this should be said: what is so vital about Greek philosophy is that it went its way, the way of the spoken and responsive word without reflecting on *what* speaking is or *who* the speaker is. The Greeks had no word for the subject. The *Logos* is what is said, what is named, what is brought together and laid down. This is not seen as an operation on the part of the speaker but rather as an operation on the part of that from which everything comes together. A typical phrase by Socrates runs: 'it is not my *Logos*'. This holds for Heraclitus as well as for Socrates. The *Logos* is in common. Thus Aristotle rejected any theory which attributed to words a natural relation to things. Word signs are *kata syntheke*; that means they are conventions. But this does not mean unities which are arbitrarily put together at any time. They are unities which precede any differentiation in these or those words. This is the origin which has never begun but is always already effective. It grounds the indissoluble proximity of thinking and speaking and so survives the question concerning the beginning and the end of philosophy.

Translated by Christopher Macann

‘Time and being’, 1925–7

Thomas Sheehan

It is very significant that Heidegger chose *Die Grundprobleme der Phänomenologie*, the lecture course he gave in the summer semester of 1927, to be the first publication in his monumental *Gesamtausgabe*.¹ The text is rich in many ways, but one of its major claims to fame may rest in a footnote, taken from Heidegger’s own manuscript of the course, that appears on page 1 of the published version. This elliptical footnote, which in fact functions like a subtitle for the whole volume, asserts that the lecture course represents a ‘New elaboration of *Sein und Zeit*, Part One, Division Three’.²

This footnote promises quite a bit indeed. It is well known that when Heidegger published *Sein und Zeit* in February of 1927, the book was lacking its crowning section – Part One, Division Three – entitled ‘Time and being’. The absence of this section, coupled with Heidegger’s announcement in 1953 that it would never appear, has raised doubts about the feasibility of his philosophical program and has led to an abundance of speculation, much of it misleading, about the so-called ‘turn’ from the work of the early Heidegger to that of the later Heidegger. But now it would seem that the problem can be solved. The lecture course *Die Grundprobleme der Phänomenologie*, which Heidegger began on Saturday, April 30, 1927, just over eight weeks after the publication of *Sein und Zeit*, would appear to fill out the missing section that was to be the climax of Heidegger’s *magnum opus*. Indeed, on the second day of lecturing Heidegger provided his students with an outline of the course, and Parts Two and Three of that outline promised to be a complete elaboration of ‘Time and being’.³ And if we required further confirmation of the hypothesis that *Die Grundprobleme der Phänomenologie* fulfills the promise of *Sein und Zeit*, we would seem to find it in the new, 1977 *Gesamtausgabe* edition of *Sein und Zeit*. There Heidegger

has annotated the title of all of Part One of his treatise in the following way:

The Interpretation of Dasein in terms of Temporality [notation: 'The published portion covers only this much'] and the Explication of Time as the Transcendental Horizon for the Question of Being [notation: 'For this, cf. the Marburg lecture course of 1927, *Die Grundprobleme der Phänomenologie*'].⁴

But, for better or worse, the matter is not all that simple. To begin with, *Die Grundprobleme der Phänomenologie* (hereafter: *GP*) makes almost no advance into the uncharted territory of what *Sein und Zeit* (hereafter: *SZ*) called 'Time and being'. To be sure, *if* in the lecture course Heidegger had covered all the material that he outlined for his students, he would have filled out 'Time and being', albeit in a different order from what he had promised in *SZ*. But in fact the very few pages in *GP* that push into the area of 'Time and being' (on a strict reading, *GP*, 441–5) were reserved to the second half of the second-to-last meeting of the course (July 23, 1927) and, on the whole, are among the least satisfying of all the lectures. We are faced, then, with a paradox, or perhaps even with an error. The footnote at the beginning of *GP* promises us an elaboration of 'Time and being', but the text itself delivers, on a strict interpretation, only four pages of such an elaboration or, on a very broad interpretation, only 28 pages (*GP*, 441–69), most of which provide only schematic hints.

What are we to make of all of this in terms of the philosophical program that Heidegger outlined in *SZ* and that he claimed to have fulfilled over the course of his philosophical career?

Heidegger's one and only topic from beginning to end – what he called *the* issue of philosophy – was the kinetic structure of the disclosure of entities, that is, the movement that constitutes the analogical unity (or meaning) of the being of entities. At various points in his career Heidegger called this kinetic structure of disclosure the 'time-character' of being or the 'truth' of being or the 'clearing' of being. What all these titles point to in common is the *bivalence* that is intrinsic to the movement of disclosure. The 'being' or disclosive structure of entities is a phenomenological movement made up of a dimension of relative absence and a dimension of relative presence. Now, whereas traditional philosophy had always known about the presential dimension of entities, Heidegger took upon himself the task of pointing out the absential dimension of such disclosure. This absential dimension (in Greek: *lēthē*) is intrinsic to the presential dimension (in Greek: *alētheia*) of the kinetic disclosure of things. To put this in an imperfect neologism, we may say that Heideg-

ger's one and only topic was 'pres-ab-sence', the kinetic bivalence that makes up the disclosive structure (or 'being') of entities.

Now, whereas Heidegger had always intended to work out pres-ab-sence as the meaning of being, in his early works – and especially in *SZ* and *GP* – he approached the problem from within a transcendental framework. He did so specifically from an analysis of Dasein's projection of temporal schemata that would provide the horizon for the meaning of being. In his later works, however, Heidegger shifted away from the language and viewpoint of the transcendental framework and showed that the movement intrinsic to the disclosive structure of entities was responsible for the projective movement of Dasein. This shift constituted a regaining and a deepening of the archaic Greek viewpoint, where the autodisclosure of entities requires and governs the disclosive movement of man.

The main importance of *GP* for our purposes is that it did *not* complete the vector of *SZ*, indeed that it hardly advanced beyond the analyses contained in that work. That is, *GP* represents Heidegger's last effort to work out the kinetic meaning of being from within a transcendental framework. In the last part of this essay I shall use the incompleteness of *GP* as an occasion for discussing how Heidegger shifts away from the language and viewpoint of transcendental philosophy and effects the 'turn' into the pres-ab-sential structure of being.

On the way to that issue we notice some important questions that emerge with the publication of *GP*. If *GP* was intended to be a 'new' elaboration of 'Time and being', what happened to the first draft of that section? Were there other early programs for working out the kinetic meaning of being? What is the relation between the transcendentalism of *GP* and the very different approach of Heidegger's later thought? These are not just historical questions. They touch on the major issue of philosophy, the meaning of being.

In order to work out these questions and to arrive at the heart of Heidegger's thought, I divide this essay into four parts: I. Discussion of the *history* of the writing of *SZ*; II. Comparison of the *structures* of various programs for elaborating the meaning of being, from 1925 through 1927; III. An analysis of the *argument* of *GP*; and IV. Clarification of the *significance* of *GP* for the major issue, the meaning of being as pres-ab-sence.

I History: the genesis of *Being and Time*

Whatever the conditions of its gestation, *SZ* in the form we know it is a premature work, rushed into print under publish-or-perish conditions. Heidegger himself once spoke of the 'strange publication' of his 'long-

guarded work', and some 30 years after its appearance he remarked: 'The fundamental flaw of the book *Sein und Zeit* is perhaps that I ventured forth too far too early.'⁵ The haste is revealed in a number of ways. There is, for example, the laundry list of topics, scattered throughout the published pages of *SZ*, that Heidegger promises to treat in the unpublished part. One has the sense that Heidegger is just postponing these problems without having a clear idea of how he will answer them. Above all, the haste of composition can perhaps be seen in Heidegger's inability to bring the work to completion. What, then, were the academic pressures that gave us this truncated work?

A The politics of publish-or-perish⁶

The history of Heidegger's academic promotions between 1923 and 1927 is a story of books that he promised but never published or that he published but never completed. For example, he was called from Freiburg to Marburg in 1923 on the strength of some chapters of a projected book on Aristotle, which in fact never got into print. What he did in that instance was to rewrite his 1922 Freiburg course on Aristotle and submit it to the philosophy faculty at Marburg. This draft received rave reviews from Paul Natorp and Nicolai Hartmann, both of Marburg, and in recommending Heidegger for a position there they called this essay absolutely astonishing (*vollends etwas überraschends*). With high scientific quality, they said, it shows how the history of philosophy from the Middle Ages through Luther to modern thinkers is determined by Aristotle. Its method and careful etymologies, they went on, show a philosophical delicacy which step by step discovers heretofore unnoticed connections between issues. His method sheds light even for experts in the field, especially on decisive points passed over by nineteenth-century scholars. Needless to say, Heidegger got the job. And two years later, when Heidegger was applying for promotion, Hartmann would again remark on the powerful achievement, philological exactness (*Akribie*), and penetrating interpretation that characterized this manuscript on Aristotle, and he would emphasize how it illuminates whole epochs of thought in a way long unknown in philosophy.

But the work never appeared. Although in the summer of 1925 it was declared ready for the press, Heidegger's interest now lay in the new project that was to make his name. *SZ* had been maturing for some while. In his last two lecture days as a Privatdozent at Freiburg (July 18 and 25, 1923), Heidegger had read material that would become Part One, Division One, of *SZ*, and a year later at Marburg, in July of 1924, he presented the 'Urform' of *SZ* as a 6000-word lecture entitled 'Der Begriff der Zeit', which contained most of the essential theses of *SZ* from being-in-the-world to within-time-ness. Another year later, in the summer of 1925, he read the first draft of *SZ* in the Marburg lecture

course, *Geschichte des Zeitbegriffs*. But just as this course got underway there began the politics of publish-or-perish.

On May 1, 1925, Nicolai Hartmann, then Ordinarius in the chair that had been vacated by the recent death of Paul Natorp, informed the University of Marburg that he would leave in October for Cologne. On May 19 Heidegger told the dean of his availability for Hartmann's position, and at a faculty meeting the following week Hartmann proposed Heidegger as his successor.

Then the trouble began. On June 24, after Hartmann had recommended to the faculty that Heidegger's name be the only one (*unico loco*) that they propose to the Ministry in Berlin as fitting for the position, Professor Rudolf Wedekind of the philosophy faculty raised the issue that would block Heidegger's promotion for two more years: his dearth of publications. Hartmann responded that, beside the still-promised book on Aristotle, the young scholar had a new and absolutely outstanding work (*eine neue und ganz hervorragende Arbeit*) in manuscript and ready for publication. To the best of my knowledge these words of Hartmann on June 24, 1925, are the first public mention of *SZ*, even though Hartmann gave the work no title. In any case, the faculty that day voted against an *unico loco* nomination. Instead, they proposed a three-person list with Heidegger's name in first place. On July 8, 1925, they briefly reversed themselves and proposed Heidegger *unico loco* by a vote of 6 in favor, 4 opposed, and 1 abstaining, but on July 18 they reverted to their former decision. The choice of Heidegger, incidentally, was not without opposition from the theology faculty, which used Rudolf Otto as its spokesman against Heidegger.

Between July 18 and August 3, 1925, Hartmann in the name of the faculty drafted in his own hand an extraordinary document to be sent to Berlin to the Minister for Science, Art and Education in support of Heidegger's nomination. In that document he calls Heidegger a researcher and teacher of the first rank, one who, besides his work on Aristotle, which is yet to be published, has recently produced a systematic work, now in press (sic), which is entitled – *Zeit und Sein!* (It seems impossible to ascertain whether that title, *Time and Being*, was a slip of the pen on Hartmann's part or actually the first title that Heidegger may have proposed for the work.) The book, says Hartmann, does nothing less than to broach the ultimate and basic questions of ontology in a synthesis of phenomenology – here for the first time freed from all [Husserlian] subjectivism – with the great tradition of metaphysics that stretches from the Greeks through the medievals to the moderns. Hartmann remarks that whereas older practitioners of phenomenology see it as a preliminary laying of foundations and thereby frequently give the impression of one-sidedness or narrow-mindedness, Heidegger's work gets right down to basic problems, breaks through stalemated positions,

and opens new horizons. There is simply nothing comparable to it in the broad field of Heidegger's contemporaries, he writes. Therefore, Heidegger's nomination, even though it is accompanied by that of Heimsoeth and Pfänder, stands far above the other two.

With a recommendation like that, Heidegger should have had the job in a walk. But it was not to be so. All through 1926 and most of 1927 the philosophy faculty at Marburg fought a running battle with the Ministry in Berlin over Heidegger's nomination. On January 27, 1926, the Minister wrote to the dean that, with all due respect for Heidegger's success in the classroom (which by then was somewhat legendary), the historical significance of the chair of philosophy at Marburg precluded Heidegger's being appointed to it until he had gained the respect and recognition of his colleagues by more publications. The Minister called for a new list of nominations.

On February 25, 1926, the faculty met and unanimously voted that Heidegger be urged to have *SZ* typed in several copies and given to the dean so that it might be submitted to a group of scholars for their evaluation. At the same time they underlined the urgency of having Heidegger produce the text at least in galley proofs. The dean paid a personal visit to Heidegger's office to pass on this news, and Heidegger replied that he was prepared to have the text in press by April 1, 1926.

In a little over eight weeks – until early March in his first-floor study at Schwanallee 21, Marburg, and thereafter at the farmhouse of Johann Brender near his retreat in Todtnauberg – Heidegger pulled together his lecture notes of *Geschichte des Zeitbegriffs* into *SZ*. On April 2, 1926, six days before Husserl's birthday celebration in Todtnauberg (see the dedication in *SZ*), Heidegger wrote to the dean that the work was now in press and that by May 1, 10 to 12 signatures (160–92 pages) would be ready – that is, roughly the material up to the chapter on *Sorge*, or, in other terms, the material on *Dasein* that was covered in *Geschichte des Zeitbegriffs*. However, it was June 18 before the dean forwarded the galley pages to Berlin in the face of the Ministry's renewed call for other names and an expanded list. Finally, on November 26, 1926, came the Minister's reply. Having examined the proof sheets, he still cannot give Heidegger the job. The pages were returned, as Heidegger recalled, marked 'Inadequate'.

Three months later, in February of 1927, the book was published as the fragment we know, minus 'Time and being' and all of Part Two, 'Phenomenological destruction of the history of ontology'. Heidegger had published *and* perished. He had rushed his 'long-guarded work' into print and in so doing had 'ventured forth too far too early', perhaps chiefly in an effort to get a job. That venture was to block the fulfillment of his philosophical program for years to come.

B The missing sections of Being and Time

What was the status of the 'second half' of *SZ* when its 'first half' was published in February of 1927? Had Heidegger completed by then a draft of 'Time and being', and, if so, what form did it take and why did it not appear? My purpose in raising and answering these questions is to search out what is unique about *GP*.

(N.B.: In the rest of the essay I shall abbreviate references to the structure of *SZ* in the following way. The whole of *SZ* was to be comprised of two Parts, each of which would contain three Divisions. I shall abbreviate the *Parts* of *SZ* with Roman numerals and the *Divisions* of *SZ* with Arabic numerals. Thus, *SZ* I.1 means *SZ* Part One, Division One. *SZ* II.3 means *SZ* Part Two, Division Three, and so on. As everyone knows, the only published sections of the work are Part One, Divisions One and Two, i.e., *SZ* I.1 and I.2.)

Much of *SZ* II ('Basic features of a phenomenological destruction of the history of ontology, using the problematic of *Temporalität* as a clue') was sketched out by the spring of 1926. Specifically, a first draft of *SZ* II.1 ('Kant's doctrine of schematism and time, as a preliminary stage in a problematic of *Temporalität*') was delivered in the lecture course *Logik* from January 28 through February 26, 1926. And a first draft of *SZ* II.3 ('Aristotle's essay on time, as providing a way of discriminating the phenomenal basis and the limits of ancient ontology') was hinted at in *SZ* §81 and was read on July 6 and 13, 1927, in the lecture course of *GP*. But what of *SZ* I.3, 'Time and being'?

Heidegger's letter to the dean, written from Todtnauberg on April 2, 1926, merely said that the work was in press, but neither that it was completed as a whole nor how much beyond the 160 to 192 pages was finished at that time. Two weeks later, on April 16, 1926, Mrs. Malvina Husserl wrote to Roman Ingarden about Heidegger's 'just completed work' ('*seines eben vollendeten Werkes*'), and on April 28 Edmund Husserl wrote to Gustav Albrecht about Heidegger's 'book which is now in press' ('*seines eben in Druck befindlichen Buches*'). But many years later Heidegger remembered showing Husserl at this time the 'nearly finished manuscript' ('*das nahezu fertige Manuskript*') of *SZ*, and in 1963 he claimed that 15 signatures (ca. 240 pages) were forwarded to the dean and eventually to the Ministry in Berlin, that is, up through §47 of the chapter on death.⁷ On the basis of Heidegger's letter of April 2, 1926, I believe that it is most likely that during that month he sent off to Niemeyer Publishers something like the first 190 pages of *SZ* (i.e., up to around chapter vi of *SZ* I.1). While it is conceivable that he had finished all of *SZ* I.2 by this time, I think that it is not probable, just as it is very unlikely that he had actually completed *SZ* I.3 by the spring of 1926.

However, there are three bits of evidence that attest to the possibility that Heidegger completed a first draft of *SZ* I.3 sometime between April and December of 1926. None of these reports, however, is very strong; at best they provide clues or hints.

First: Concerning the famous footnote at the beginning of *GP*, F.-W. von Herrmann, the editor of *GP*, has written: 'The designation "*New elaboration*" means that an *older* one preceded it. The first elaboration of the Division "Time and Being" came about in the train of writing Divisions One and Two. As Martin Heidegger has communicated to me orally, he burned the first draft [*die erste Fassung*] soon after he wrote it.'⁸ But was this first draft anything more than a sketch? We cannot be sure.

Secondly, Heidegger informed H.-G. Gadamer that *SZ* I.3 was ready to be printed along with I.1 and I.2 in early 1927, but it was held back because Volume VIII of the *Jahrbuch für Philosophie und phänomenologische Forschung* had to be shared with (besides *SZ*) Oskar Becker's 370-page treatise on '*Mathematische Existenz: Untersuchungen zur Logik und Ontologie mathematischer Phänomene*'.⁹

Thirdly, a footnote in the first edition of *SZ* (but omitted in later editions) at p. 349 refers the reader ahead to *SZ* I.3, *chapter two* for a clarification of the origin of *Bedeutung* and the possibility of *Begriffsbildung* (the latter being a topic that Heidegger covered in his seminars of 1926–7 and 1927–8). This is the only reference to a specific chapter within *SZ* I.3, and it would seem to indicate that Heidegger had at least some kind of outline of 'Time and being' when he wrote the footnote.

But what about the content of this famous missing section? Thanks to an exchange between Heidegger and Max Müller, we have a sketch of some of the material from the first draft of *SZ* I.3. Müller writes:

In the first elaboration of *Sein und Zeit*, Part One, Division Three, which, as I mentioned above, was to bear the title '*Zeit und Sein*' and was to bring about a 'turn' in the treatment of being itself, Heidegger, according to a personal communication, attempted to distinguish a threefold difference.

(a) the '*transcendental*' [*transzendente*] difference, or ontological difference in the narrower sense: the differentiation of entities from their beingness.

(b) the '*transcendence-related*' [*transzendenzhafte*] difference or ontological difference in the wider sense: the differentiation of entities and their beingness from being itself.

(c) the '*transcendent*' [*transzendente*] difference, or theological difference in the strict sense: the differentiation of God from entities, from beingness, and from being.

But because it was not experienced but only set up speculatively,

this attempt at a draft was given up as itself being 'onto-theological', because it ventures an assertion about God which even now in the experience of 'essential thinking' is not immediately made.¹⁰

Moreover, in a marginal note to *SZ* 39 (published in the *Gesamtausgabe* version of *SZ*), where Heidegger gives the projected outline of his treatise, he glosses the title 'Time and being' with the following: 'The transcendence-related difference./The overcoming of the horizon as such./The turn around into the origin./Presence from out of this origin.'¹¹ While cryptic in many ways, this gloss allows of the following interpretation. When one makes the transcendence-related difference between the beingness of entities and being itself, then one has overcome horizontal perspectives, which in fact are based on the correlativity of subjectivity and beingness, and has turned around into the origin, *lêthē*, whence arises *alêtheia*. (We shall return to this towards the end of the next part of this essay.)

What might have made Heidegger destroy the first draft or sketch of *SZ* I.3? Besides the dissatisfaction that Heidegger reported to Müller, there is other evidence that soon after *SZ* went to the press he had hesitations about his program or at least about its formulation. On February 13, 1952, exactly 25 years after *SZ* appeared, Heidegger told the students in his Aristotle seminar at Freiburg that immediately after the printing of *SZ* he was startled (*ich habe . . . einen Schrecken bekommen*) to realize what while, as regards the *issue*, being was indeed alluded to and present in *In-der-Welt-sein*, nonetheless, as regards the *formulation*, being, as it were, only 'limped along behind' (*hinkt es gleichsam hinten nach*). Perhaps the shock of this realization is what prompted Heidegger, in the spring of 1927, to reformulate 'Time and being' all over again with *GP*'s new draft focused on what he called the four 'basic problems' of phenomenology, namely, the ontological difference, the whatness and howness of being, the unity and multiplicity of being, and the truth-character of being. This outline of the crowning section of Heidegger's treatise held up at least through the following summer, his last semester at Marburg, when he repeated that fourfold division in his course on Leibniz (July 10, 1928), although he rearranged the outline slightly. In the Leibniz course, what was the fourth section in *GP* (it is now called 'The veritative character of being') is made to precede what was the third section in *GP*, which is now called 'The regionality of being and the unity of the idea of being'. But the whole program seemed to be in trouble. That fall (October 14, 1928), during his first semester as Husserl's successor in Freiburg, Heidegger told W. R. Boyce Gibson that it would be 'some little time' – not likely by the next issue of the *Jahrbuch* – before the rest of *SZ* appeared.¹²

After the spring of 1929 we hear nothing more about the completion

of Heidegger's *magnum opus*. The project of *SZ*, which basically remains enclosed within the Marburg period, had apparently ground to a halt. In the 1953 Foreword to the seventh edition of *SZ* we read: 'While the previous editions have borne the designation "First Half", this has now been deleted. After a quarter of a century, the second half could no longer be added unless the first were presented anew.'¹³

II Structure: three outlines of the program

Over a span of exactly two years (May 4, 1925–May 4, 1927), Heidegger offered three different outlines of his treatise on the meaning of being (cf. the accompanying chart):

1. May 4, 1925: The outline of the course *Geschichte des Zeitbegriffs* (*GZ*), which appears on p. 10f. of the published version.¹⁴
2. April, 1926: The outline of *SZ*, published on p. 39f. of that work.
3. May 4, 1927: The outline of *GP*, published on p. 32f. of the text.

History of the Concept of Time (*GZ*), 1925

I. The phenomenon of time; the concept of time

1. Preparatory description: the field where time appears (= *SZ* I.1)
 - i. Phenomenology and the being-question } (= *SZ* Introduction)
 - ii. Dasein and the being-question }
 - iii. Everydayness and being-in-the-world (= *SZ* I.1, chaps. i–iv)
 - 1) Introduction
 - 2) Descartes
 - 3) Worldhood of the world
 - 4) Reality of the outer world
 - 5) Spatiality
 - 6) The 'who'
 - iv. Being-in and care (= *SZ* I.1, chaps. v–vi)
 - 1) *Entdecktheit* (*Befindlichkeit*, *Verstehen*, *Auslegung*, *Rede*, *Sprache*)
 - 2) Fallenness
 - 3) Fear and dread
 - 4) Care
2. The laying-free of time itself (= *SZ* I.2, chaps. i–iii)
 - i. Death
 - ii. Conscience and guilt
 - iii. Time as Dasein's being*

* The course ends here.

3. The conceptual interpretation of time (= SZ I.2, chaps. iv-vi)

II. History of the concept of time from today backward (= SZ II)

1. Bergson
2. Kant and Newton
3. Aristotle

III. The question of being-in-general and of the being of history and nature in particular (= SZ I.3)

Being and Time (SZ), 1926

I. Dasein as temporality; time as the horizon of the being-question

1. Preparatory analysis of Dasein
 - i. The task of this analysis
 - ii. Being-in-the-world as Dasein's basic state
 - iii. The worldhood of the world
 - 1) Introduction
 - 2) Worldhood
 - 3) Descartes
 - 4) Spatiality
 - iv. The 'who' and the 'they'
 - v. Being-in
 - 1) The 'there' (*Befindlichkeit*, *Verstehen*, *Auslegung*, *Rede*, *Sprache*)
 - 2) Fallenness
 - vi. Care as Dasein's being
 - 1) Dread
 - 2) Care
 - 3) Reality of the outer world
 - 4) Truth
2. Dasein and temporality
 - i-iii. The laying-free of temporality (cf. p. 436b)
 - iv-vi. Temporal interpretation of Dasein: first repetition of the preparatory analysis*
3. Time and being
 - i. Working out *Temporalität*
 - ii. Answering the question of the meaning of being
 - iii. Thematic analysis of Dasein, or renewed repetition of the preparatory analysis of Dasein
 - iv. Methodology

* The text ('First Half') ends here.

II. Destruction of the history of ontology

1. Kant's doctrine of schematism and time
2. Ontological foundation of Descartes's *cogito sum*
3. Aristotle's essay on time

The Basic Problems of Phenomenology (GP), 1927

I. Discussion of four traditional theses on being

1. Kantian: being is not a real predicate
2. Medieval–Aristotelian: being comprises *essentia* and *existentia*
3. Modern: being's basic modes are *res extensa* and *res cogitans*
4. Logic: being as the 'is' of the copula

II. The fundamental ontological question about the meaning of being in general; the basic structures and modes of being

1. The problem of the ontological difference
 - i. Common time and temporality
 - ii. Temporality as self-transcendence and as horizon
 - iii. Time as the horizon for the question of being
 - iv. Being and entities*
2. The problem of the basic articulations of being (whatness, howness)
3. The problem of the modifications of being and of the unity of being's multiplicity
4. The truth character of being

III. The scientific method of ontology and the idea of phenomenology

1. The ontic foundation of ontology and the analysis of Dasein as fundamental ontology
2. The apriority of being and the possibility and structure of a priori knowledge
3. The basic elements of phenomenological method: reduction, construction, and destruction
4. Phenomenological ontology and the concept of philosophy

By comparing these three outlines we shall be able to see concretely the following: what *SZ* intended to accomplish but did not; whether and how *GP* promised to complete *SZ*; and above all what the so-called 'turn' in Heidegger's thought means. Because the outline of *SZ* is fairly well known, I will begin with that and then compare it with the earlier outline (in *GZ*) and the later outline (in *GP*).

*The course ends here.

A Being and Time, 1926

SZ was projected in two Parts. Part One, which as a whole was called 'fundamental ontology', was to use a new understanding of human temporality (*Zeitlichkeit*) to determine the nature and structure of the time-character (*Temporalität*) of being in general and of its possible variations. Part Two, which was to be devoted to the destruction of the history of ontology, would use the time-character of being, which had been worked out in the fundamental ontology, as the clue for reducing the content of traditional ontology to the primordial and implicitly temporal experiences in which being has always been understood. It is worth pointing out that words like 'temporality' and 'time' had almost nothing to do with naturalistic *chronos*. Rather, they referred to the phenomenological *movement of disclosure* (what the Greeks called *alētheuein*), both in that part which human nature contributes to disclosure and in that part which is intrinsic to the nature of disclosure itself.¹⁵

Each Part of SZ had three Divisions, and in its published form the treatise got no further than Part One, Division Two. Part One as a whole bears the title: 'The interpretation of Dasein in terms of temporality [=SZ I.1 and I.2] and the explanation of time as the transcendental horizon for the question of being [=SZ 1.3, unpublished].' That is, SZ I.1 would establish that the structure of human existence is care (*Sorge*); SZ I.2 would interpret the meaning of care to be temporality or existential movement (*Zeitlichkeit*); and SZ I.3 would show how *Zeitlichkeit*, in its horizon-forming function called *Temporalität*, determines the 'temporal' or kinetic meaning of being.

SZ I.1 reads human being as constituted by three moments: (1) existentiality: human being is ahead of itself; (2) facticity: human being is ahead of itself by being already in a world of meaningfulness; (3) fallenness: human being's already-ahead-ness opens up the realm of intelligibility within which man is present to – and for the most part absorbed in – the things of his concern. Now, these three moments which make up the structure of care can in fact be reduced to two. Existentiality and facticity are but two faces of one phenomenon: man's already-ahead-ness, his being in excess of himself and other things. In turn they make possible man's encounter with worldly things. Thus, Dasein is (1) already projected possibility, which (2) renders possible the encounter with entities. Dasein's relative self-absence allows things to be present, or his excess allows him access to entities.

In SZ I.2, after showing *what* Dasein is already-out-towards (namely, his ownmost possibility of death) and *how* Dasein is called to accept that aheadness (namely, in conscience and by resolve), Heidegger goes on to spell out the temporal or kinetic structure of care.

(1) As ahead of himself, man is *becoming* his ownmost possibility. The

moment of existentiality is grounded in man's existential futurity whereby he is becoming (or coming towards) himself.

(2) But to become that possibility means that, in going forward, one is returning to and indeed is reappropriating what he 'already is', his finitude. The moment of facticity is grounded in existential *Gewesenheit*. This word does not refer to the 'past' (*Vergangenheit*) but to one's own 'alreadiness', to one's essential and already operative possibility which one can appropriate anew.

(3) The two moments of *becoming* what one *already is* make it possible that man encounter things as meaningful. The moment of having access to worldly entities is grounded in the present as a *letting-be-present*.

Thus, human temporality – or better, existential movement – is the unifying ground of the structure of care, and it is generated (*zeitigt sich*) in the aforementioned three moments of self-transcendence (called the 'ekstases'). In fact, man is nothing other than this transcendence. Just as we collapsed the three moments of care into two, so we may do the same for the three moments of existential movement or temporality. (1) By becoming what he already is, (2) man lets things be present. Or, (1) because we are in kinetic 'excess' of ourselves and things, (2) we have meaningful 'access' to ourselves and things. In fact, these two moments, in which one can hear distant echoes of 'potentiality' and 'actuality', are rooted in Heidegger's retrieval of the hidden meaning in the Aristotelian notion of movement (*kinēsis*) as a phenomenon of actual presence (*energeia*) grounded in a hidden but dynamic potentiality (*dynamis*). In Heidegger's retrieval, the moment of 'potentiality' (man's relative self-absence in the sense of his already being out towards his nothingness) releases from itself the moment of actual presentness in which entities are met in their being. In its own way, then, human temporality or movement is a matter of presence-by-absence or pres-ab-sence.

While that is as far as the published form of *SZ* got, the next Division, *SZ* I.3, was to take the crucial step. The one and only issue of the treatise is the *movement of disclosure*. From one perspective this movement, which Heidegger called primordial time, is that which unifies Dasein's self-transcendence, and here it is called 'temporality' (*Zeitlichkeit*). But from another perspective this movement opens up and shapes the horizon that gives all modes of being their kinetic or temporal character, and here it is called the 'time-character' (*Temporalität*) of being. *Zeitlichkeit* and *Temporalität* are the same primordial movement of disclosure seen on the one hand as human self-transcendence and on the other hand as the transcendental horizon that conditions the kinetic meaning of being. In *SZ* I.2, §69, section 'c' (*SZ* 365), Heidegger did make a stab at showing how *Zeitlichkeit* forms the horizontal schema for understanding *man's* being, but he did not spell out how it shapes the

horizon for understanding other modes of being. That task was reserved for SZ I.3.

By carefully noting hints that are scattered throughout the published portion of SZ, we can see that SZ I.3 was to unfold in four steps. The following is an effort to reconstruct the format of those four steps. The numbers in parentheses refer to the pages and paragraphs in SZ where the hints can be found.

The *first* step is usually called the 'working out' (*Ausarbeitung*) of the being-question or the 'laying free of the horizon' (*Freilegung des Horizontes*). This initial step was to show simply that the most primordial mode of the generation of temporality as the movement of self-transcendence is the horizontal schema of presence-by-absence which possibilizes the understanding of being in terms of time (cf. SZ 231b, 437c). What is here called the 'time-character' of being is only a preliminary name for that movement which Heidegger would later prefer to call the 'truth' or 'clearing' of being: disclosure as presence (*alētheia*) by absence (*lēthē*).

The *second* step, closely bound up with the first, was to be the 'answering' (*Beantwortung*) of the being-question by an elaboration of the temporal or kinetic determination (presence-by-absence) of being in general and of its possible variations: readiness-to-hand, presence-at-hand, Dasein, and subsistence (SZ 231b, 333b). Here too Heidegger was to have worked out much of what we called the laundry list of topics alluded to throughout SZ I.1-2: how the intentionality of consciousness is grounded in the unity of Dasein's self-transcendence (363 note), how time has its own mode of being (406a), how space and time are coupled together (368b), the condition of notness and negativity (286a), the distinction between the 'who' of existence and the 'what' of presence-at-hand in the broadest sense (45a), the temporal constitution of discourse and the temporal characteristics of language patterns (349c), the differentiation between the ontic and the historical (403c), the concrete elaboration of the world-structure in general and its possible variations (366d), how the forgetting of the world leads to ontologies of entities-within-the-world as 'nature' and to ontologies of value (100d), the clarification of whatness, howness, something, nothing, and nothingness (see WG in *Wegmarken*, 69). Specifically within the section on truth were to be discussed: the existential interpretation of science (357a), the 'is' of the copula and the 'as' scheme (349c, 360c), how *Bedeutung* arises (349c), the possibility of *Begrifflichkeit* (39b) and *Begriffsbildung* (349c), and the full treatment of *logos* (160a). Presumably in this section too Heidegger would have discussed the possibility of regional ontologies, which is based on what he called the 'non-deductive genealogy of the different possible ways of being' (11b), as well as the question of the ontological determination of positive-ontic science ('the kind of research in which *entities* are uncovered') and its kind of truth (230b).

The *third* step of *SZ* I.3 was to be a further repetition (within *SZ* I.2, chapters iv–vi already constituted a first repetition) of the existential analysis of Dasein on the same and truly ontological level at which the concept of being would have already been discussed (333b). This treatment was to be the proper realization (*Durchführung*, 13b) of the Dasein-analytic, and it would be the thematic analysis of human existence (436b) as contrasted with the preparatory and primordial analyses that made up *SZ* I.1 and I.2. As contrasted with the first repetition of the preliminary Dasein-analysis in *SZ* I.2 – chapters iv–vi, which were also called the ‘temporal interpretation of Dasein’ (see 17c, 234c, 304c, 333b) – the treatment of Dasein in *SZ* I.3 would be called the ‘renewed repetition’ (*erneute Wiederholung*: 333b, cf. 17b). Among the topics to be discussed here was, for example, that of ‘an adequate conceptual interpretation of everydayness’ (371f.).

The *fourth* step of ‘Time and being’ was to be methodological. Whereas *SZ* §7 had offered only a ‘preliminary idea of phenomenology’ (28a), *SZ* I.3 was to present the ‘[full] idea of phenomenology’ (357a). As far as I can see, this is the only topic that Heidegger, in *SZ*, promises to treat in this fourth area. The outline of *GP*, as we shall see below, offered a rich panoply of topics to be covered under the rubric of methodology.

B History of the Concept of Time, 1925

If we now compare the outline of *SZ* with the earlier outline of the course *Geschichte des Zeitbegriffs* (*GZ*), we discern the following issues. (Here I prescind from Heidegger’s long introduction on phenomenology.)

(1) *The world-analysis* (*GZ* I.1, chap. iii = *SZ* I.1, chap. iii). The most developed material of *GZ* is the analysis of the Umwelt, a theme which Heidegger had elaborated ever since his 1919–20 course at Freiburg (which was also called *Grundprobleme der Phänomenologie*). In *GZ*, out of the 25 lectures devoted to the preparatory analysis of Dasein (June 6 through July 31, 1925), 11 of them were dedicated to the analysis of the environment (June 22 through July 13).

Within the 1925 course we notice a different order from *SZ*. The Descartes section of *GZ* is placed *before* the paragraphs on the worldhood of the world – just the opposite from *SZ*. Moreover, in 1925 Heidegger places immediately *after* the worldhood analyses the section on the reality of the outer world, whereas this material is saved for later in *SZ* (*SZ* §43, ‘Dasein, worldhood, and reality’).

(2) *Being-in and Care* (*GZ* I.1, chap. iv = *SZ* I.1, chaps. v and vi). The material which *SZ* spreads over two chapters (‘Being-in as such’ and ‘Care as the being of Dasein’) is here lumped together under the comprehensive heading *Das In-Sein*, with the four articulations: discoveredness, fallenness, dread, and care.

(3) *Zeitlichkeit und Temporalität*. The 1925 lecture course makes it

clear that by 'time' (*Zeit*) Heidegger means the temporality of Dasein as self-transcendence (*Zeitlichkeit*) rather than the horizontal time-character of being itself (*Temporalität*). Time, says Heidegger on July 31 (p. 442 of the published text), is Dasein itself. It is that whereby human existence is its proper wholeness as being-ahead-of-itself. In fact, we should not say that 'Time is', but rather that 'Dasein, as time, generates (*zeitigt*) its being' (cf. *SZ* 328c). In other words, *GZ* did not get as far as the major differentiation between *Zeitlichkeit* and *Temporalität* which is central to *SZ* and whose import Heidegger stressed to Father Richardson when he wrote that the temporality (*Zeitlichkeit*) characterized in *SZ* I.2 is not yet 'the most proper element of time that must be sought in answer to the being-question'.¹⁶ It seems that the lecture course *GZ* was indeed on its way to *Temporalität* as the arena of presence-by-absence that gives all modes of being their temporal determination, but we will have to wait until January 11, 1926, during Heidegger's course on logic, before that concept properly emerges (*Logik*, p. 199).

(4) 'Time and being' (*GZ* III = *SZ* I.3). We notice that the projected content of *GZ* III, which generally corresponds to *SZ*'s 'Time and being', includes not only a fundamental ontology of the meaning of being in general (*die Frage nach dem Sein überhaupt*) but also two regional ontologies (. . . *und nach dem Sein von Geschichte und Natur im besondern*). The whole course, in fact, bore the subtitle: 'Prolegomena to the phenomenology of nature and history'. The 'Prolegomena' cover the existential analytic, the destruction of the history of ontology, and the fundamental ontology of being in general – in short, the material of the whole of *SZ* as Heidegger originally projected it.¹⁷ On the other hand, neither *SZ* nor *GP* promises any regional ontologies at all. At most they might have shown the derivability of regional ontologies from fundamental ontology under the rubric of a 'non-deductive genealogy of the possible modes of being' (*SZ* 11b).

(5) *The Destruction of the History of Ontology* (*GZ* II = *SZ* II). Finally we note the different location and the different content of the material on the history of ontology. In *GZ* it appears between the existential-temporal analytic and the elaboration of the meaning of being. That is to say, if *SZ* were to follow the outline of *GZ*, it would run as follows: *SZ* I.1-2; II.1-3; and then I.3. Moreover, the content of this area is different in *GZ*. Whereas *SZ* proposed to treat of Kant, Descartes, and Aristotle, here in *GZ* Heidegger proposes to treat Bergson, Kant and Newton, and Aristotle.

C The Basic Problems of Phenomenology, 1927

In our comparison of *GZ* and *SZ*, the main points of interests concern the location and the content of what was to remain unpublished in *SZ*. What *SZ* calls 'Time and being' was, in *GZ*, comprised of both

fundamental and regional ontologies and placed after the destruction of the history of ontology. In *SZ* this section is composed only of fundamental ontology (the kinetic-temporal meaning of being and its variations), and it precedes the destruction. As we turn now to the outline of *GP* and compare it with those same unpublished portions of *SZ*, we note the following:

(1) *The kernel of 'Time and being' (GP II and III)* now has a twofold articulation: 1. fundamental ontology and 2. methodology.¹⁸ The section on fundamental ontology (*GP II*) is in turn articulated into four basic problems that are systematically derived from four traditional theses on being: (i) the ontological difference, drawn from Kant's thesis on being; (ii) the basic articulations of being as whatness and howness (or thatness), drawn from the Aristotelian and medieval thesis that the being of entities is both *essentia* and *existentia*; (iii) the unity and the multiple modifications of being, drawn from the modern thesis that the basic modes of being are *res cogitans* and *res extensa*; and (iv) the truth-character of being, drawn from the thesis of logic that all entities can be expressed through the 'is' of the copula. We have seen above that these four theses remain operative, although in a slightly rearranged order, as Heidegger's outline for 'Time and being' as late as his course on Leibniz during the summer of 1928. And we recall that the truth-character of being was to be treated in the *second* chapter of *SZ* I.3 (see *SZ*, first edition, 349n.), whereas here it is relegated to the *fourth* chapter of *GP II*.

(2) *The term 'ontological difference' makes its debut (GP II.1)* and seems to include both the *Ausarbeitung* of the being question (that is, the interpretation of *Temporalität* as temporal horizon) and the *Beantwortung* (thematic answering) of the being question, but it does not include the question of the variations of being. Moreover, within the chapter on the ontological difference there are four steps in the elaboration of the meaning of being, the first two of which are generally co-extensive with the material of *SZ* I.1–2. Those four steps are the following:

(i) *Time and Temporality (Zeit und Zeitlichkeit)*: Here Heidegger moves from Aristotle's notion of time (= *SZ* II.3) as the number of motion, to the roots of original time in man's threefold self-transcendence.

(ii) *Time as self-transcendence and time as horizontal (Zeitlichkeit und Temporalität)*: In this section the move is from temporality as constitutive of man's being, and towards temporality as formative of the horizon which determines all experience, including the understanding of being. It would seem from the title of this section (*GP* 389) that here Heidegger advances beyond the material contained in *SZ* I.2, that is, beyond *Zeitlichkeit* and into *Temporalität*. However, that is not the case; indeed, this section gets no further than the material found in *SZ* §69, section 'c'. One external proof of that is found in the programmatic sentence that opens the *following* section: 'Now we must get an idea of how

Temporalität, on the basis of the *Zeitlichkeit* that grounds Dasein's transcendence, makes possible Dasein's understanding of being' (GP 429).

(iii) Time as the horizon for the determination of being (*Temporalität und Sein*): Here begins the new elaboration of what SZ called 'Time and being'. However, as I shall show below, the advance beyond SZ is quite minimal.

(iv) Being and entities (*Sein und Seiendes*): Here the ontological difference was to be clarified on the basis of the distinction between Dasein's transcendence into the temporal ecstases and his return to the entities rendered intelligible within that horizon. Here too there is hardly any real advance beyond SZ.

(3) *The historical-destructive part* (GP I) is again relocated before the systematic treatment of the fundamental ontological question about the meaning of being, just as it was in GZ. In a sense, then, GP reverts to the pre-SZ model of GZ, where the historical-destructive part of the treatise was contained within, rather than following after, fundamental ontology. Furthermore we notice that the historical-destructive part of GP (that is, GP I) now deals with being rather than with time, and that what SZ reserved for treatment at SZ II.3 (namely, Aristotle and time) is incorporated within GP II.1.

(4) *In GP there is no mention of the second repetition of the Dasein-analytic that is promised in SZ.* In fact, there is not even an explicit mention of the first repetition of the Dasein-analysis (= SZ I.2, chaps. iv-vi), although pages 362-88 of GP present material from SZ I.2, chap. vi. While it is possible, but not probable, that GP III.1 ('The ontic foundation of ontology, and the analysis of Dasein as fundamental ontology') might have contained such a second repetition, it is more likely that this section would have been only methodological in nature, as indeed Heidegger seems to indicate when he delineates the scope of the section: 'So the first task within the clarification of the scientific character of ontology is the demonstration of its ontic foundation and the characterization of this founding' (GP 27).

D Conclusions

What may be concluded from this tedious comparison of outlines? In the first place, it is clear enough what Heidegger intended to do, namely, to show that the kinetic meaning of disclosure ('being') is presence-by-absence. That is, he wanted to show that the presence or *alētheia* or intelligibility of entities happens on the basis of a prior and possibilizing absence or *lēthē* or unintelligibility. Indeed, he wanted to show that man is correlative to both these moments of the disclosive process by virtue of his self-transcendence. That is, man's relative self-absence or already-ahead-ness is correlative to the *lēthē*-dimension of disclosure, and his being-present-to-things is correlative to the *alētheia*-dimension of

disclosure. It is also clear that in this early period Heidegger intended to complete *SZ* by drawing the kinetic meaning of being as pre-ab-sence from out of the self-transcendent and horizontal temporality of *Dasein*.¹⁹

In the second place it is clear that Heidegger's conception of the program for elaborating the temporal meaning of being is somewhat fluid from 1925 through 1927 (and even through 1928, if we count the reshuffling of the four basic questions in Heidegger's course on Leibniz). Not only is the program fluid; perhaps it is even in trouble. One sign of that is the way Heidegger keeps rearranging the order of 'Time and being' in relation to the destruction of the history of ontology. I take these rearrangements as a symptom of the deeper problem of the relation of system and history in Heidegger's program. In a word: How can a systematic ontology be reconciled with the historicity of human existence? If the transcendental condition which renders possible the systematics of being in *SZ* I.3 is *Dasein*'s own temporality and historicity, then the inquiry into being is itself characterized by historicity. To answer the question of the meaning of being in terms of time is in effect to show that the question of being is itself historical and that one has to question, historically, the very history of the question of being. It seems that Heidegger is aware of this problem and aware that the problem of system and history becomes the problem of relativism. Is the last word in this matter to be *veritas temporis filia*?²⁰

In the third place, and closely linked to the former two, is the question of the relation between time as self-transcendence and time as the horizon for the meaning of being. This is the problem of the relation of priority between *Dasein* and being, if indeed we can speak of these as 'two'. Does being have the structure of pres-ab-sence because of *Dasein*'s pres-ab-sential self-transcendence? Or is *Dasein* self-transcendent because being has intrinsically the structure of pres-ab-sence?

In the fourth place, lurking behind the above questions of history and system, temporality and truth, self-transcendence and being-as-the-transcendent, there is the question of the so-called 'turn'. We must say from the outset that the turn is not a move away from the fundamental standpoint of *SZ* (being as pres-ab-sence); it is not a new phase in Heidegger's development after the collapse of the *SZ* program in all its various forms. Rather, the turn was built into Heidegger's program from the start, and it always meant an overcoming of (1) the metaphysics of actuality and (2) the humanism of subjectivity.

Re #1: From the early twenties Heidegger always conceived of the turn as the step back from all forms of the metaphysics of actuality (being as presence) and into not only the Greek *alētheia* (which is still a matter of presence) but even further back to the possibilizing ground of *alētheia*, namely, *lēthē* (absence).²¹ To become aware of the *lēthē*-dimension is not to extinguish it but to let it be. In that sense the turn

is to be understood as '*Die Umkehr in die Herkunft*' (this is the gloss at SZ 39, which we mentioned above) – that is, the return to, the awareness and positive appropriation of, *lēthē* as the source or origin of intelligibility, so as then to see the 'derivation' of being-as-presence from out of this absence: '*Das Anwesen aus dieser Herkunft*' (ibid.). To overcome the metaphysics of actuality does not mean to abolish it but to reinsert it into the dimension of potentiality. But actuality (*energeia*) embedded in potentiality (*dynamis*) is what Aristotle means by movement (*kinēsis*). If one properly understands Heidegger's retrieval of the problematic of *kinēsis* in Aristotle, then one can see how Heidegger's turn towards the *lēthē*-dimension of disclosure means a regaining of being as movement.

Re #2: In so far as all modes of being human are correlative to modes of being itself, the modern humanism of subjectivity merely corresponds to the latest phase of the metaphysics of actuality. A positive recovery of the pre-metaphysics of 'potentiality' (*lēthē*, or *dynamis* properly retrieved) would correspondingly entail the discovery of a pre-humanistic understanding of man in terms of his living-into-possibilities (his self-absence). The correlativity between man's pres-ab-sence (SZ: *Zeitlichkeit*) and the pres-ab-sence that is being or disclosure (SZ: *die Temporalität des Seins*) is what Heidegger's thought is all about. We can also recognize here the problematic of 'authenticity' or proper selfhood. Man comes into his own by resolving not to be his own but to let himself go into the potentiality he already is. In so doing he wakes up to the fact that his transcendence is rooted in and governed by the *lēthē*-dimension of disclosure. (*Transzendenz aber von Wahrheit des Seyns her: das Ereignis*, new edition of SZ, 51 note a).

What then of the shift in language that characterizes Heidegger's work in the thirties? This does not make up the turn (*Kehre*) in the proper sense but is only a shift in direction (*Wendung*) within the turn.²² It merely evidences Heidegger's awareness that the turn from all forms of the metaphysics of stable presence into the non-metaphysics of privative absence (*lēthē*) could not be carried out within the language of the last form of metaphysics, transcendental horizontality.

The turn was to come into its own in SZ I.3. Here the whole project was to turn around, both in terms of *how* one thinks (the abandonment of subjectivity and 'the overcoming of the horizon as such') and in terms of *what* is to be thought (positive appropriation of '*Vergessenheit, Lēthē, Verbergung, Entzug . . .*').²³ Heidegger's abandonment of the program of SZ did not mean abandonment of the turn that had been built into that program from the beginning, but only of the transcendental language of metaphysics. SZ I.3, he later wrote, 'was held back because thought failed in adequately [showing] this turn and did not succeed with the help of the language of metaphysics'.²⁴

Yet for all that, Heidegger claims to have carried out the turn and to

have answered the question of the meaning of being. 'Contrary [to what is generally supposed], the question of *Being and Time* is decisively fulfilled in the thinking of the turn', he wrote to Father Richardson. And he specified. The clearing of the realm of intelligibility on the basis of *lēthē* as withdrawal is what 'being' means.²⁵

The above analyses of the various early programs for working out the temporal or kinetic meaning of being have brought us to the point where we can begin to study and evaluate the contents of *GP*. We shall see that *GP* does not in any way complete *SZ*. However, the fact that *GP* fails to complete *SZ* – indeed, that it failed to complete itself – has a positive meaning. It was a distant warning of the coming shift away from the transcendental language and framework of *SZ* so as finally to bring about the turn into 'the thing itself'.²⁶

III Argument: an analysis of *The Basic Problems of Phenomenology*

GP was delivered in 22 two-hour lectures on Wednesdays and Saturdays from 30 April through July 27, 1927, excepting June 2–15 and July 7–12. Preceding the three Parts was a programmatic Introduction which revealed their systematic interrelation (*GP* 1–33).

A Introduction

The course opens with and sustains throughout (*GP* 2, 36, 81, 175f., 263, 353, 467) an implicit critique of Husserl's phenomenology. How does one single out 'the basic problems of phenomenology'? Not from any current definition of the art! Not only are there widely divergent conceptions of the nature and tasks of phenomenology, but even if these could be harmonized into a unified definition, this would provide little help in sorting out, much less in solving, the basic problems of phenomenology. For it is emphatically not the case 'that phenomenological research today has gotten to the center of the philosophical problematic and defined the proper essence of that problematic from out of its possibilities' (*GP* 3).

For Heidegger, phenomenology is neither scientific philosophy itself, nor one science among others, nor a pre-science for grounding the properly philosophical disciplines (ethics, logic, and so on). Rather, it is the method for doing scientific philosophy at all. Accordingly, in opposition to Husserl's tendency to separate phenomenology, as scientific philosophy itself, from the authority of the philosophical tradition, Heidegger asserts that phenomenology is only 'the more explicit and more radical understanding of the idea of scientific philosophy as this has been ambitioned throughout its development in ever new and coherently unified endeavors from the Greeks to Hegel' (*GP* 3). Thus, far from allowing any 'dog-

matic' (= Husserlian) definition of phenomenology to delineate the basic problems (*GP* 4), Heidegger will turn to history, both to discern in a preliminary way what scientific philosophy has claimed to be and to carry out a phenomenological-critical discussion of four traditional theses on being. This discussion, it becomes clear, is a 'retrieve' – 'the disclosing of a problem's original and heretofore hidden possibilities so that by the development of them the problem is transformed and thus for the first time has its content as a problem preserved' (*KPM* 195). From out of the four traditional theses Heidegger will shape the four basic problems of phenomenological philosophy. The circularity here is both obvious and, for Heidegger, inevitable (cf. *SZ* 152f.), and it points to the fundamental divergence of his 'historical' approach from Husserl's presuppositionless one.

A glance at the tradition shows that philosophy by its nature is scientific (not *Weltanschauung*) and specifically the science of being (and not of the acts and structures of consciousness). In a word, philosophy is ontology, 'the theoretical-conceptual interpretation of being, its structure and possibilities' (*GP* 15). And if phenomenology is to ontology as method is to science, then explaining the basic problems of phenomenology entails demonstrating 'the possibility and necessity of the absolute science of being' (*ibid.*).

The three Parts of *GP* are the steps to accomplishing this goal. Part One: An analysis of four traditional theses on being will point up their one common problem: an inadequate determination of the meaning of being due to an inadequate determination of Dasein as phenomenological locus of the understanding of being. Part Two: Heidegger will determine the unified meaning of being from out of human temporality by resolving the four 'basic problems of phenomenology' retrieved from the four traditional theses. Part Three was to lay out four elements of the methodology of ontology.

B Four traditional theses on being

Heidegger's discussions of each of the four theses is divided into three parts, roughly: (a) a presentation of the thesis, (b) a discussion of its implicit problem-area from a phenomenological viewpoint, and (c) a preliminary indication of the direction to be taken for an adequate resolution of the problem. In the following summaries I restrict myself to only the essential strands of the argument: how each thesis points beyond itself to the need for a fundamental ontology.

1. *The Kantian thesis* (*GP* 35-107): Kant states his thesis on being within the context of his refutation of the ontological argument for the existence of God, but Heidegger's interest is only in the ontological, not the theological, import of the thesis. Negatively, Kant's thesis declares that being is not a 'real' predicate, i.e., does not deal with or in any

way increase the conceptual content of a thing; it does not concern the *res* (whatness, hence 'realness') of the thing. Positively, the thesis maintains that being consists in the 'absolute position' of the thing as object in relation to the empirical faculty of judgment (perception). Although Kant leaves the thesis as such at that (apart from his application of it in refutation of the ontological argument), Heidegger pursues a double problem inherent in it. On the one hand, what Kant means by being as perception is unclear, for perception (*Wahrnehmung*) can mean either the act of perceiving (*Wahrnehmen*) or the thing perceived (*das Wahrgenommene*) or the state of perceivedness (*die Wahrgenommenheit*, 'the being-perceived of what is perceived in the perceiving comportment', *GP* 79). Heidegger takes it that the last is what Kant means by being, but the very unclarity in which Kant left the issue points to the need for a fundamental clarification of the manifold being-structure of perception. On the other hand, it would seem that perceivedness is not itself being, but must presuppose the actuality or being of the thing in question as prior to the possibility of being-as-perceivedness. This twofold unclarity of the Kantian thesis points to the need for a fundamental clarification of the manifold being-structure of perception.

Heidegger attempts this clarification by an analysis of intentionality. Perception is a perceptive being-directed-towards the perceived, such that the perceived as such is understood in its perceivedness. In this seeming commonplace one must avoid two things: on the one hand, erroneous objectivist readings of intentionality whereby it is taken as a relation of two things-on-hand: an on-hand psychic subject and an on-hand physical object. Perceiving would then be a psychic act that a subject happens to perform when there happens to be a physical object on hand. Rather, Heidegger shows that perceiving is intrinsically relational, even when that to which it relates (its *Wozu*) is only a hallucination. Intentionality, therefore, has an *a priori* character of relating: it is relationality as such. On the other hand, one must avoid an erroneous subjectivizing or immanentizing of intentionality which might express itself in the question, 'How do intentions reach an "outside" world?' Intentionality is neither subjective nor objective but is rooted in transcendence itself. Here for the first time in the course Heidegger introduces his term 'Dasein' in place of 'subject': man's very being-structure (Dasein) is transcendence; transcendence is the *ratio essendi* of intentionality just as intentionality is the *ratio cognoscendi* of transcendence. For Dasein there can be no 'outside' to which it must penetrate because there is no 'inside' in which it can be trapped. This clarification of perception as intentional likewise clarifies the second problem, the relation between being as perceivedness and being as actual presence-at-hand. As intentional, perceiving is always directed to the thing perceived so as to discover it; the thing's perceivedness is its discoveredness

(*Entdecktheit*). But if perception really discovers the thing as it is in itself (for such is the nature and goal of perception), then it must be guided beforehand by a prior understanding of the way-of-being and the kind-of-being (*Vorhandensein*) of the thing perceived. Perceiving must have a prior pre-conceptual understanding of that thing, one in which its being is disclosed (*erschlossen*). In the perceivedness that goes with this understanding, there is the prior disclosedness (*Erschlossenheit*) of the being of perceived things.

This discussion of the intentional character of perception opens onto the later discussion of the ontological difference between being and entities. Kant's assertion that being is not a real predicate says as much as that being is not an entity. The distinction between the perception of a thing as the perceivedness or *discoveredness* of an entity and the prior *disclosedness* (*Erschlossenheit*) of the being of the discovered thing points to the ontological difference between being and entities which is made on the basis of Dasein as transcendence: not just intentional transcendence to entities but transcendence 'beyond' entities to (i.e., the prior understanding of) their being.

This preliminary clarification of the Dasein-relatedness of being calls for a fuller analysis of how transcendence, determined by temporality, makes possible man's understanding of being. Likewise, the distinction drawn here between the disclosedness of being and the discoveredness of entities demands an analysis of the ontological difference between being and entities. Both tasks are reserved for GP II.1.

2. *The Aristotelian and medieval thesis that the being of entities includes both whatness (essentia) and presence-at-hand (existentia)* (GP 108-71). Just as the Kantian thesis shows the subject-relatedness of the notion of the existence (*Wirklichkeit*) of things, so the medieval *essentia* and *existentia*, when traced back to their Aristotelian origins, likewise reveal their relation to the intentional comportment of man and therefore call for an ontology of existence as a fundamental delineation of the unified meaning of being. Kant had shown that existence entailed relation to the subject (perception), but he took over unproblematically from scholasticism the notion of essence (in his *Realität*). Heidegger will show that essence too points back to the subject, specifically to productive comportment or *poiēsis* in the broadest sense.

From Suárez' *Disputationes metaphysicae* and, to a lesser degree, from Aquinas' *De ente et essentia*, Heidegger lays out a basic medieval lexicon of *essentia* and *existentia* and traces the various words (*quidditas*, *forma*, *natura* on the one hand, *actualitas* on the other) back to their corresponding Aristotelian terms. But those Greek words all point implicitly to the horizon of man's productive comportment (*poiēsis*). Why is *existentia* conceived as *actualitas* or *energeia*? Because of a relation to action (*Handeln*, *praxis*) or production (*Herstellen*, *poiēsis*) whereby something is

brought forth and made accessible to man. The same with *essentia*: The *forma* or *morphē* of something is determined by its *eidos prohaireton*, which, as priorly directing production, has the character of revealing what something is 'before' it is actualized (*to ti ēn einai, quod quid erat esse*). That which, in production, is 'prior' to actualization (viz., the *eidos* or *essentia* or nature of the product) is free from all the imperfection and incompleteness of the actual thing and so determines what something 'always already was', *to ti ēn einai, das jeweils schon voraus Wesende* or *Gewesenes* – used for the otherwise lacking perfect form of *einai* (cf. new SZ 114 note a).

Just as the words for existence and essence point to man's 'poetic' activity of letting things come forth as they are into accessibility or use, so too the words for entities. The *hypokeimenon* is what 'lies present' (*keisthai*) in the area of man's comportment as available to his use. As an *ousia*, an entity, according to the pre-philosophical use of *ousia*, is a present possession or usable reality; its state of being (*ousia, essentia*) is usability based on producedness. All of this is the unthematic and implicit horizon according to which the Greeks understood being, and it points to the need not only for a retreat from the medieval *essentia* and *existentia* to the Greek experience of being, but even more for a thematization and elaboration of what was only implicit in the Greek *energeia* and *ousia*.

A more original grasp of the basic articulation of being into essence and existence requires, preliminarily, a discussion of the intentional structure of productive activity and, in the long run, an ontology of human existence as *poiēsis* and *praxis*. Just as perception is perception of something as it is in itself, so too production, as intentional comportment, presupposes an understanding of the product's being-in-itself. Producing is at once a relating of the product to oneself and a freeing of it for its own being. This letting-free of one's products is essential to man's transcendence as intentional.

But can 'production' serve as the clue to *all* kinds of entities? What about nature, which requires no human production? Answer: Nature is known as such only in productive activity wherein *hylē*, as what is not produced, is required for what is to be produced.

But finally, the essence–existence distinction, even if rooted in production, does not apply to one kind of entity: human existence, where whatness or essence is of the unique sort, 'whoness'. Hence, even as clarified thus far, the essence–existence pair remains problematic until clarified in terms of the full meaning of being as such, its unity and multiplicity; and this, in turn, must await an ontology of man as the locus of the understanding of being. Not only does the second thesis point to the need for a deeper 'return to the "subject"' but it also calls for a clarification of the meaning of being and of the basic articulations

of being. All this is left to *GP* II.2. (Just how important Heidegger thought this analysis of the Aristotelian and medieval thesis to be is shown by the fact that he took it over whole into his 1928 course on Leibniz as the section, 'Essentia. Die Grundverfassung des Seins überhaupt' – and that he referred to it again in the 1935 course *Einführung in die Metaphysik*, p. 140 = *Introduction to Metaphysics*, Doubleday/Anchor, p. 154; Yale, p. 184; as well as in *Nietzsche* II, 14.)

3. *The modern thesis* (*GP* 172–251), from Descartes to Husserl, differentiates the being of the critically normative self-conscious subject from that of its possible objects, but it misses the unique being of subjectivity. Heidegger shows the insufficiency of the modern turn to the subject by attacking Kant's understanding of personhood.

For Kant the essence of the ego lies neither in the transcendental unity of apperception (*personalitas transcendentalis*) and even less in the empirical self-consciousness of the ego of apprehension (*personalitas psychologica*), but rather in the moral ego, calculating, acting, taking itself as its goal, self-conscious before the law (*personalitas moralis*). But even here Kant misses the proper being of *acting*, wherein the moral person is goal for himself, and instead Kant sees the existence of the person on the model of the existence of a thing. The reason: Kant too reads being as 'producedness' insofar as he takes over unquestioned the medieval notion of finite being as createdness. Only a creative producer can know a substance in its full being; man as a finite and therefore receptive knower is confined to phenomenal reality. Thus Kant continues unbroken the metaphysical tradition which reads being as produced presentness (*Vorhandensein*).

For a more adequate treatment of the being of subjectivity Heidegger summarizes much of *SZ* I.1 on being-in-the-world (*GP* 219–47). The point is that even before explicit self-reflection and quite apart from any supposed introspection, man as being-in-the-world already co-grasps himself as mirrored in the matrix of purposefulness called world. Transcending himself into that matrix of meaning, man is at once for-the-sake-of-his-own-being and an understanding of being as such. Thus the proper being of subjectivity can only be decided out of a proper analysis of transcendence, and this will point not only to the unified meaning of being but also to differentiations of being that are more basic than subjectivity and nature. These questions are referred to *GP* II.3.

4. *In investigating the thesis of logic* (*GP* 252–320) that the 'is' of the copula applies to all entities regardless of their mode of being, Heidegger selects the characteristic views of Aristotle, Hobbes, Mill, and Lotze in order to show the rich manifold of meanings (whatness, thatness, true-ness) that can attach to being taken as the 'is'. But here lies a double problem. First, the multiplicity of meanings is not systematically derived from a prior idea of the unity of being; and secondly, the designation

of being as copula, by taking the assertion as a series of words to be connected, misses the priority of the sense of 'is' in terms of truth.

To arrive at a more adequate basis for the 'is', Heidegger rejects the notion of the assertion as a series of words corresponding to ideas and ultimately to objects, and cuts through to the *logos apophantikos* as intentional comportment embodying an understanding of being. But even this assertoric disclosure of being in apophantic predication and verbal communication rests on a deeper foundation. Being-in-the-world is the primordial hermeneutic (= event of interpretative understanding of intelligibilities) which discloses entities in their original and non-derived syntheses with the lived purposes of existence. Transcendence is original truth. The intentional structure of truth as disclosure, grounded ultimately in temporality, alone can provide access to the unified meaning, and with that to the truth-character, of being in *GP* II.4.

C Towards fundamental ontology

Each of the four theses, when broken down to its inner problems and possibilities, has pointed beyond itself to the need for reformulating the idea of being in general on the basis of an adequate ontology of human existence. Thus we are led to *GP* II, 'The fundamental ontological question about the meaning of Being in general and its basic structures and modes'. Whereas Heidegger here proposed to present and then to push beyond *SZ*'s analysis of temporality and spell out the time-character of being by resolving the four basic problems of phenomenology, the course (there were only six lecture days left) did very little more than summarize the published portions of *SZ*.

What is interesting for our purposes are the few steps that Heidegger takes at *GP* 441–5 beyond *SZ* and in pursuance of its promise to determine the meaning of being in general from the horizon opened up by man's temporal self-transcendence. The reasons for this interest are two-fold: positively, to find out how and at what point *SZ* I.3 would have built off of *SZ* I.2, and negatively, to find out why and at what point that continuation became impossible for Heidegger.

GP 389 begins the summary of the main material of *SZ*. Being shows up only in the understanding of being, which is intrinsic to Dasein: therefore, only by discovering the structures and ground of this understanding can we define the meaning of being in general. But all understanding is fundamentally the projection of possibilities into which one lives and from out of which one understands oneself. Projective understanding is rooted in Dasein's basic state of self-transcendence, being-in-the-world; and this in turn is grounded in the generation (*Zeitigung*) of temporality, or better, in temporality as self-generation in the primordial form of authentic, self-appropriated existence. I am who I really am by anticipating the most basic possibility which I already am, my death.

Authentic existence is the threefold structure of self-transcendence: being present to oneself and to things in the moment of existential insight (*Gegenwart* as *Augenblick*) by becoming (*Zukunft* as *Vorlaufen*) and renewing (*Gewesenheit* as *Wiederholung*) the most proper possibility that one is.

This primary temporality underlies the derived temporal structures of dealing with, e.g., tools in one's environment. A tool is for attaining some end: it has its being as 'in-order-to-ness'. Whenever I use a tool, not only do I already understand its being (what it is: a tool; how it is: available for doing something), but more, I implicitly relate myself to that being in a temporal way. I have the tool present to me (*Gegenwart* as *Gegenwärtigen*) by retaining it (*Gewesenheit* as *Behalten*) in terms of an expectation of what it can accomplish (*Zukunft* as *Gewärtigen*). Ordinary usage overlooks these moments and their temporal base, but when the tool is damaged or missing or just put up with, its structure, modified but still temporal, becomes noticeable. Not only that, but the various forms of breakdown of equipment make visible the modifications of the temporal moments of tool-oriented self-transcendence. Three examples will reveal the privative modifications of these ekstases.

1. *To lack or miss something.* To come out of the theater and find one's car stolen is certainly to experience the not-there-ness (*das Nicht-vorfinden*; GP 441 = SZ 335b) of the car. But not every instance of not-there-ness is an instance of missing (we don't miss last year's flu attack), rather only those in which something *needed* is lacking. We cannot say exactly, therefore, that to miss means to not-have-something-present, for it is precisely to have something present as needed (the car) when in fact it is not around. The experience of missing something reveals the privative modification of the ekstasis of having-present into having-unpresent. To express this privative character, Heidegger calls the modified ekstasis an *UNgegenwärtigen* as contrasted with a *NICHTgegenwärtigen* (cf. the Greek *mē on* vs. *ouk on*). To miss is to make present something expected but not present.

2. *To be surprised by something which unexpectedly but handily shows up.* Your car gone, you are about to step on a bus when a horn honks behind you – your best friend is offering you a ride. Having the bus present in terms of *that* expected ride means not expecting a more comfortable ride in a car. The non-expectation, however, is not an absolute absence of expectation (*Nichtgewärtigen*) but a relative or privative un-expectation (*Ungewärtigen*, GP 442b = SZ 355c), which, in fact, is what allows us to be surprised. The experience of surprise reveals the privative modification of the futural ekstasis of tool-use from expectation to un-expectation.

3. *Merely putting up with an implement.* Say no friend offers you a ride and you have to take the bus home. You have the bus present, you

retain it in terms of the expected arrival home, but you really do not 'take the bus into account' (*das Nichtrechnen mit*, SZ 355d) or 'retain' it to that end; rather, you merely put up with it. This 'not taking into account', however, is not absolute non-retention but a privative 'un-retention'. You 'hold on' to the bus by putting up with it as second-best. This phenomenon reveals, in tool-use, the privative modification of the ekstasis of alreadiness from retaining to un-retaining.

This is the point (GP 441 = SZ §69a) where the 'new working out' of 'Time and being' was to take off. Having seen – at least in the cases of Dasein and tools – the elaboration of the unity of self-transcendence, we now await the elaboration of the corresponding horizontal schemata (the 'whereunto' of the direction of self-transcendence) which condition the meaning of whatever is experienced in correlation with the ekstasis. At one pole, the threefold self-transcendence; at the other pole, the threefold horizontal schema – the whole constituting the ekstastic-horizontal correlation that is primordial temporality. We expect, too, that each horizontal schema will have both a positive and a privative moment. Out of the interrelation of presence and absence both in temporality as a whole (where becoming and alreadiness function as relative absence for having-present) and within each moment of temporality (which includes both positivity and privation) we would expect the elaboration of the analogically unified meaning of being in general as presence-by-absence in correlation with man's own existential presence-by-absence.

In fact, however, the further step Heidegger takes in that direction is very cautious – if not downright hesitant. 'In order not to complicate too much our view of the phenomenon of temporality, which in any case is difficult to grasp' (GP 435b), he imposes a double limit on the treatment. On the one hand, he restricts himself to the experience of dealing with tools only, and on the other he treats only of the horizontal schema that corresponds to the one ekstasis of having-present.

Correlative to but distinct from the self-transcendent moment of having a tool present, there is the horizontal schema whose time-character is called presence (*Praesenz*). In order to show the distinctness of the ekstastic and horizontal poles in their correlativity, Heidegger generally, but not consistently, uses German-based words for the ekstastic pole: e.g., *Zeitlichkeit*, *Zukunft*, *Gewesenheit*, *Gegenwart*; and Latin-based words for the horizontal pole: *Temporalität*, *Praesenz*, *Absenz*; cf. GP 433 and *Logik*, 199f. Having-present, as an ekstastical moment, has a schematic indication (*Vorzeichnung*, GP 435a) of that out-towards-which transcendence is, viz., the horizon of *Praesenz* (also called *Anwesenheit*). *Praesenz* thus constitutes 'the condition of the possibility of understanding readiness-to-hand as such' (434). Having-present, in fact, projects all it has present and could possibly have present in terms of this horizon of

presence or presentness and so understands those things as having a 'presential sense' (433b) and as 'present things' (*als Anwesendes*, 436a).

But recall that in the breakdown of a tool there occurs a privative modification of having-present to having-unpresent, or, from the viewpoint of the tool, a modification of its being from readiness-to-hand to un-readiness-to-hand (*Zuhandenheit, Abhandenheit*, 433b), from presentness to un-presentness (*Anwesenheit, Abwesenheit*, 436a).

Thus there is in general no horizon corresponding to 'missing' as a determined [mode of] having-present, but rather a *specifically modified horizon . . . of presence*. Belonging to the ekstasis of having-unpresent, which makes 'missing' possible, there is the horizontal schema of *absence* (441a).

This absential modification of the presence . . . which is given with [the experience of] missing is precisely what allows the ready-to-hand to become conspicuous [as lacking] (442b).

At this point Heidegger's advance stops. We have seen that the horizontal schema of *Praesenz* encompasses presentness, along with un-presentness as its privative modification. But this has been demonstrated only in the one horizontal schema corresponding to the one ekstasis of having-present in the one area of tool-use. Left undiscussed are: the other temporal schemata (with their privative modifications) in which tools are experienced; all the temporal schemata of non-tools; and above all, the analogically unified temporal meaning of being as such and in general.

But, although the advance stops quickly, Heidegger asks some weighty and portentous questions about the ground it covered and failed to cover. 'Within the ontological', he says (438b), 'the potential is higher than the actual' and 'everything positive becomes especially clear from the privative' (439c). Why? 'Parenthetically we may say that the reasons lie equally in the essence of temporality and in the essence of the negation that is rooted in temporality' (*ibid.*). However, if the rule that the potential underlies the actual and that the privative clarifies the positive helped to open the advance beyond SZ, it also has momentarily blocked further progress.

The modification of presence to the absence in which that presence, as modified, maintains itself cannot be interpreted more precisely without going into the characterization of this modification in general, i.e., into the modification of presence as 'not', as *negativum*, and without clarifying this in its connection with time (442a).

If the absential modification allows things to show up as lacking, then we meet the

fundamental but difficult problem: To what extent is there not precisely a negative moment (if we formally call the ab-sential a negation) that constitutes itself in the structure of this being, i.e., above all in readiness-to-hand? To ask the question in terms of basic principles: To what extent does a negative, a not, lie in *Temporalität* in general and likewise in *Zeitlichkeit*? Or even: To what extent is time itself the condition of the possibility of nothingness at all? (442 f.).

Time, we know, was only the first name for what Heidegger later called the truth of being. In both cases being is seen as pres-ab-sence. The last question above, therefore, is very close to asking: To what extent does presence itself, which must transcend the acts in which it is performed, contain within itself a privation (absence, nothingness, *lēthē*) which is the possibility of that very presence? The question teeters there. Granted that the modification of presence to absence has a character of negativity,

where does the root of this 'not' in general lie? Closer consideration shows that even the not – or nothingness as the essence of the not – can likewise be interpreted only from out of the essence of time and that only from time can the possibility of the modification, e.g. of presentness to absentness, be clarified. Hegel is finally on the track of a fundamental truth when he says: Being and Nothingness are identical, i.e., belong together. Of course the more radical question is: What makes possible such a most primordial belonging-together-ness? We are not sufficiently prepared to press on into this darkness . . . (443a,b).

GP is hardly a completion of *SZ*. But its formal significance, apart from the intrinsic interest of its content, lies in its incompleteness. To be sure, it shows how Heidegger might have completed *SZ* if he had chosen to continue in a transcendental framework. But more importantly it leads to the brink from which, beyond the transcendental framework, the absence can begin to be seen for itself.

IV Significance: 'The thing itself'

In asking about the significance of this publication, we must distinguish between what it may contribute to Heidegger scholarship and what it offers by way of insight into the phenomenological 'thing itself', being as pres-ab-sence.

There is plenty for Heidegger scholarship. We meet the first mention of the 'ontological difference', although the concept does not get developed. (On November 17, 1925, Heidegger did speak of '*ein fundamentaler ontologischer Unterschied*', but in reference to Husserl's ideal-real distinction in *Logical Investigations*. See *Logik*, p. 58). There are analyses of Aquinas, Scotus, Suarez, Hobbes, Mill and Lotze. There is a suggestive insight into the three stages of phenomenological method (reduction, construction, destruction) some months before Heidegger's contributions to Husserl's drafts for the *Encyclopedia Britannica* article.²⁷ More important, the work provides a good portion of Heidegger's Aristotle-interpretation, including the lengthiest analysis of *Physics* IV, 10-14 that we shall ever have from his courses (*GP* 330-61) and the first published, but by no means last, analysis of Aristotle's *De interpretatione* (*GP* 255-9; cf. *Logik*, pp. 127-42).

Important for the 'thing itself' is the fact that the course gives us Heidegger's final attempt to work out the meaning of being from within the transcendental framework. I take that incompleteness as more than merely a function of 'the limited number of lecture hours' (editor's epilogue, *GP* 473), for on a simple extrapolation from the hours devoted to *GP* I, which began in late April, *GP* II would have been finished only by mid-September and *GP* III not until the end of October. Moreover, one must ask why the handful of pages that push into 'Time and being' were reserved to the second half of the second-to-last meeting of the course (July 23) and, on the whole, are among the most unsatisfying of the whole work. We have seen from Heidegger's own indications that his program was wrapped in some uncertainty in 1927. This uncertainty may have a positive meaning insofar as it gives a distant warning of the coming shift that would allow a more adequate determination of the 'thing itself'. The following intends to give some clues for that determination.

The question that haunts *GP* and prompts the shift away from the transcendental framework is this: If entities are understood in terms of their presence, and if presence is projected in terms of privative absence, what is the root of privative absence? This is 'the problem of the finitude of time' (*GP* 437), which, in a later formulation, is the problem of the *lēthē*-dimension of *alētheia*: 'Wherever *alētheia* emerges, *lēthē* itself (which is what essentially becomes present in *alētheia*) remains absent precisely so that some thing can become unhidden as an entity.'²⁸ That is: entities become present against a background of privative absence which is intrinsic to the emergence of presence itself.²⁹

The point where *GP* breaks off and Heidegger's next phase begins is the brink from which he sees that the *lēthē*-dimension is intrinsic to being itself. The privative absence is not forged by man's projective self-absence, nor is it merely the unexplainedness of this or that entity (which

finally is embedded within a claim of the total intelligibility of reality) nor is it some occasional limit. Rather this privative negativity is intrinsic to being as pres-ab-sence. But to speak of being hiding and revealing 'itself' seemingly is to fall into the worst kind of metaphysical or mystical anthropomorphism.

How may we solve this problem? Discussion of the positive appropriation of absence – which is the turn – may be aided by two prefatory notes, one about the model and one about the language of the discussion.

1. Clearly the major model for Heidegger's exploration of being as pres-ab-sence is Aristotle's discussion of *kinēsis* in terms of *dynamis* and *energeia*, even though, to be sure, the model gets much transformed when put at the service of Heidegger's problematic.³⁰ In his seminar of 1928, 'Phenomenological exercises: interpretation of Aristotle's *Physics*, II' (thus the title, although it dealt with *Physics* III), Heidegger declared that the horizon from which Aristotle prepared the radical grasp of the conception of being was *kinēsis*, movement; the point, therefore, is to find the relation between movement and being (July 16, 1928). But being (*ousia*, or more specifically *energeia*) means always-being-the-same, self-identity, presentness and completion, whereas moving entities are intrinsically 'on the way' and incomplete: every 'now' points to another and different now, every moment is a 'yes, but . . .'. Moving entities are *mē on* and *aoriston*. Yet Aristotle's genius is that he grasped this privative state as a mode of being through the concept of *dynamis*. *Dynamis*, when seen in terms of *kinēsis*, is neither 'potentiality' nor 'mere possibility' but the positive event of appropriation-onto-*energeia* (*Eignung*, *Ereignung*); and an entity which has its being as *dynamis* is on *dynamei hēi dynaton*, an appropriated entity that is precisely in the state of being-appropriated-onto-*energeia*. *Dynamis* in this sense is, in effect, co-extensive with *kinēsis* as *energeia atelēs*: presence-by-absence. As bound up with *kinēsis* (and quite apart from the *arithmos kinēseos*), *energeia*, Heidegger says, is a *Zeitbezeichnung*, a time-designation (July 9). Of course, Heidegger's transformation of this model entails the reversal of the Greek priority of *energeia* over *dynamis* into the priority of *dynamis* over *energeia*. Intrinsic to that transformation is Heidegger's claim that the human understanding of being is itself the *Ur-kinēsis*.

2. Following the lead of Heidegger's later writings, discussion of the turn could well profit from retiring the term 'being' from the Heideggerian lexicon. Not only does the word, especially capitalized, almost inevitably suggest a metaphysical super-entity, but equally, talk of 'being itself' can lose sight of its analogical character. Heidegger is not after a univocal something subsisting on its own. Over and above the being of Dasein, the being of implements, the being of things present-at-hand, and the being of ideal objects, there is no second level of 'being itself'. Heidegger was merely searching for the analogically unified meaning of

being that is instantiated in all cases of the being of. . . . To translate *das Sein* I hesitantly suggest for now the term 'givenness', first, because it clearly implies a phenomenologically correlative locus of experience from which it is distinct but never separate – various forms of human perception (*Vernehmen*; cf. *EM* 106) in the broadest sense; and secondly, because the phrase 'givenness *itself*' seems less likely to denote something behind or in addition to the givenness of *entities*, but rather to connote a shift of phenomenological focus onto the unified analogical structure of givenness as *a priori* determinative of the regional modes in which things (or one thing) can be differently given in experience.

But with 'givenness' we have not yet arrived at Heidegger's problematic. Givenness denotes the state of an entity as given (*das Seiende als Seiendes* = *Seiendheit*), whereas Heidegger's question is not about the givenness of the given but about the very giving of givenness itself. If being is the givenness of entities (ontic disclosure or truth), what gives givenness (ontological disclosure or truth)? Or: If being accounts for ('is') the meaningful presence of things, what is the mode of the meaningful 'presence' of being?

In one sense we already know the answer: Absence possibilizes presence, possibility allows actuality, *lēthē* is the condition of *alētheia*. Furthermore, we already know the correlation-structure between man's self-transcendence and the pres-ab-sence that is 'being'. What is still undecided is the question of priority within that correlation. Let us begin by reviewing the correlation.

In terms of the phenomenologically transformed *dynamis-energeia* model, Heidegger deepens Husserl's empty-fulfilled model. Man is projected beyond himself towards his own self-absence, thereby opening an empty horizon which may be filled in by the entities which are given to experience. But this means that man has two distinct kinds of experience related to two distinct kinds of givenness. On the one hand, man experiences the recessive or withdrawn horizon which is the prior condition of the fulfilling presence of entities. On the other, he experiences the present entities. First, note their relatedness: Just as the experience of one's own privative absence is the basis of the experience of things (relative self-absence yields the realm of presence), so correlatively the experience of the givenness of the recessive possibilizing horizon is the basis of the experience of the meaningful givenness of present entities. Now note the difference: The givenness of the possibilizing horizon cannot properly be collapsed into the givenness of present entities. On comparison of the two, the horizon has a unique mode of givenness. It remains relatively absent or withdrawn in favor of the entities given within it. But at the same time *it still is given to experience*, although in the *privative* mode of relative absence. Specifically, the withdrawal or absence is given as correlative to the experience of one's own self-absence, whereas entities

are given as correlative to the experience of one's own presence. At one and the same time, man's presence-by-absence or temporal existence is correlative to (1) the presence of fulfilling entities and (2) the presence-by-absence of the conditioning horizon. In other words, any possible givenness of entities is based on the correlativity of the temporality of existence with the movement or 'time-character' of givenness itself.

The correlation established, the question now is whether the movement or time-character of givenness, as the condition of possible experience, is primarily due to man's kinetic temporality. More specifically: whether the possibility of error is rooted in man's finitude or in the finitude of the pres-ab-sence of givenness itself. Heidegger broaches the question in his essay 'On the essence of truth'.

Dasein as self-transcending has a disclosive function both with regard to a particular entity that happens to show up and with regard to the meaning-fraught complex of human purposes called 'world'. But everyday experience overlooks the world while it focuses on a particular entity: it conceals the world that it holds open. Or is it rather that the world, the realm of openness, 'conceals itself' in favor of the unconcealed entity? Yes, Heidegger asserts, the non-disclosure of *alētheia* is its most proper element. It is not something effected by Dasein's projective self-transcendence, yet nonetheless it is preserved as absential by Dasein's self-absence. The 'withdrawal' of givenness itself is prior even to Dasein's revealing-concealing relation to entities, yet Dasein preserves the *lēthē*-dimension of *alētheia* (= 'the mystery') by being projected beyond himself into the emptiness within which entities can appear.

Whereas *SZ* had read the correlation of Dasein and *lēthē* from Dasein's viewpoint, Heidegger's later position reads the correlation from the viewpoint of the *lēthē*. The later writings speak of man as 'drawn out' or 'claimed', correlative to the 'self-concealing' of the dimension which lends entities their presentness. But one experiences this withdrawal only as it is registered in one's being drawn into absence (*Geworfenheit*, *Angezogenheit*, etc.³¹), and one experiences the epochal givenness (*Geschick*) of worlds of sense only as this is registered in how one makes entities present in meaning. There can be no hypostasizing of 'something' that withdraws or gives, no objectification of 'something' that disposes over the movement that is one's temporality. There is only the experience of the self as ultimately not at its own disposal. From a Derridean perspective we might speak of man as being at the disposal of 'meaning'.³² This is hardly to import some romantic mysticism into philosophy, but only to take seriously and rigorously the full structure of the phenomenological correlation.

The later Heidegger claims to have transcended the transcendental framework and yet to have fulfilled *SZ*'s intentions of showing that the meaning of being is presence-by-absence. If *GP* had been completed, its

last sentence might possibly have read: 'The meaning of being is time; that is, givenness is given temporally because of the transcendental projection of the temporal horizons of possible experience.' If *per impossibile* GP had been completed in the late thirties, its last sentence might have read: 'The meaning of being is "movement" – that is, givenness is given in the unique state of withdrawal, and thereby man is drawn out into absence and into the finite possibilities of meaning.' In both periods the 'thing itself' is the same: being as pres-ab-sence in essential correlation with man as pres-ab-sence.

Notes

1 Martin Heidegger, *Die Grundprobleme der Phänomenologie*, Friedrich-Wilhelm von Herrmann, ed., *Gesamtausgabe* II, 24 (Frankfurt: Klostermann, 1975). English translation by Albert Hofstadter, *The Basic Problems of Phenomenology* (Bloomington: Indiana University Press, 1982). In the present essay I use my own translations from the German, and I refer to the German pagination. N.B.: Apparatus in this essay: I follow William J. Richardson's abbreviations for Heidegger's works: *Heidegger: Through Phenomenology to Thought* (The Hague: Nijhoff, 1963), p. xxxi. The number indicates the German page, and the letter indicates the paragraph on that page.

2 'Neue Ausarbeitung de 3. Abschnitts des I. Teils von "Sein und Zeit".'

3 Heidegger announced the projected outline of the course on May 4, 1927 (cf. GP 32f.). For the dating of lectures I rely on the Kyoto Manuscript of Simon Moser's *Nachschrift* of GP, a copy of which I have placed in the Phenomenology Archives at the University of Oklahoma, Norman, Oklahoma.

4 The notes read, respectively: 'Nur dieses in diesem veröffentlichten Stück' and 'Vgl. dazu Marburger Vorlesung SS 1927 (*Die Grundprobleme der Phänomenologie*)' (new SZ 53, notes a and b). On p. 134 note b of the new *Gesamtausgabe* edition of *Wegmarken*, Heidegger remarks: 'The whole of the lecture course [= *Die Grundprobleme der Phänomenologie*] belongs to *Sein und Zeit*, First Part, Third Division, "Time and being".'

14 In the classroom Heidegger entitled his course *Geschichte des Zeitbegriffs: Prolegomena zur Phänomenologie von Natur und Geschichte*. In the published version the title has been changed: *Prolegomena zur Geschichte des Zeitbegriffs*, Petra Jaeger, ed., *Gesamtausgabe*, II, 20 (Frankfurt: Klostermann, 1979). I follow Heidegger's own title, and I abbreviate it: *GZ*.

15 In this regard, see my essay 'Heidegger's "Introduction to the phenomenology of religion", 1920–21', *The Personalist*, LX, 3 (1979), 312–24, esp. pp. 315 and 320–23 (Italian translation in *Filosofia*, Turin, XXXI [1980], 431–46, esp. pp. 440–44).

16 M. Heidegger, 'Vorwort' to Richardson, *Heidegger*, p. xiii.

17 If we take the *Critique of Pure Reason* as prolegomena to a future metaphysics, and if we follow out the parallels with *SZ*, then we get something like the following:

| | Kant | Heidegger |
|----------------------------------|--|---|
| Critique as propae- deutic | I. Transcendental Doctrine of Elements | → <i>SZ</i> I.1–2 = <i>GZ</i> I = <i>GP</i> II.1–2 |
| | II. Transcendental Doctrine of Method, ch. 4 (History) | → <i>SZ</i> II.1–3 = <i>GZ</i> II = <i>GP</i> I.1–4 |
| System | I. Transcendental Philosophy (<i>Metaphysica generalis</i>) | → <i>SZ</i> I.3 = <i>GZ</i> III = <i>GP</i> II.2–4 |
| | II. Rational Physiology | → = regional ontologies |

18 At *GP* 78b Heidegger says *GP* II and III deal with the ontology of Dasein.

19 'We are ourselves the source of the idea of being. But this source must be understood as the *transcendence* of ekstatic Dasein. Only on the basis of transcendence does there take place the articulation of the various ways of being. A difficult and ultimate problem is to define the idea of being in general. Because the understanding of being belongs to transcending Dasein, the idea of being can be drawn from the subject.' 'From the last Marburg lecture course', translation (slightly revised here) by J. Macquarrie in *The Future of Our Religious Past: Essays in Honour of Rudolf Bultmann*, James M. Robinson, ed. (New York: Harper & Row, 1971), p. 321 = *Wegmarken*, p. 383.

20 At *GP* 460a Heidegger speaks of 'veritas temporalis', but clearly in a sense different from either Gellius' or Galileo's (cf. Friedrich Heer, *The Intellectual History of Europe*, Jonathan Steinberg, trans. [Cleveland and New York: The World Publishing Co., 1966], p. 307). Some of the material of this paragraph is drawn from *SZ* 20–21.

21 Cf. 'Summary of a seminar': 'As its privation, the concealing of being belongs to the clearing of being. The forgottenness of being, which constitutes the essence of metaphysics and became the stimulus for *Being and Time*, belongs to the essence of being itself. Thus there is put to the thinking of being the task

of thinking being in such a way that forgottenness [= *lēthē!*] essentially belongs to it. The thinking that begins with *Being and Time* is thus, on the one hand, an awakening from the forgottenness of being . . . but on the other hand, as this awakening, not an extinguishing of the forgottenness of being, but placing oneself in it and standing within it. Thus the awakening from the forgottenness of being to the forgottenness of being is the awakening into appropriation.' Translation (here slightly revised) by Joan Stambaugh in *On 'Time and Being'* (New York: Harper & Row, 1972), p. 29f. = *SD* 32.

22 Cf. Heidegger, 'Vorwort' in Richardson, *Heidegger*, p. xvii.

23 Cf. new *SZ* 53 note a; new *Wegmarken* notes (on p. 328) to *Humanismus-brief* 159.

26 Prof. Hans Seigfried, in a paper distributed at the Twelfth Annual Heidegger Conference (Villanova, Pa., May 27, 1978), has argued against the fact and the possibility of the turn in Heidegger's thought. He admits that 'Heidegger himself [in the *Humanismusbrief* and the *Vorwort* to Richardson's book] claims the necessity and the fact of a turn in the pursuit of the *Being and Time* project'. However, 'the claim is untenable and a simple mistake'; indeed 'in clearer moments, it seems, Heidegger himself recognized this mistake . . .'. The roots of Seigfried's misreading lie in his dogged neo-Kantian interpretations of Heidegger. Cf. his 'Descriptive phenomenology and constructivism', *PPR* 37 (1976), 248-61.

The preliminary conception of phenomenology and of the problematic of truth in *Being and Time*

Jean-François Courtine

For Heidegger, the opening up of the phenomenological dimension implies, from the time of Marburg on, an appropriation but also a radical critique of the Husserlian idea of phenomenology in the form which it assumes as transcendental idealism in *Ideas*. It is this critique whose anticipation we can now read in volume 20 of the *Gesamtausgabe*,¹ which, in leading phenomenology back to its possibility, ceases to make of it a tendency to make it mean 'the changing and thereby continuing possibility of thinking, that is to say, of replying in its time to what has to be thought'.² Without going back here into the details of this critique and of this radicalization, we will study at greater length how the Heideggerian concept of phenomenology is worked out in *Being and Time*.

In the Introduction composed in 1949 to accompany the 7th edition of his inaugural lecture 'What is metaphysics?' Heidegger asked: 'Towards what, and on what basis, and in what sphere, would the intentionality of consciousness be able to unfold if man did not hold himself open ekstatically in the openness of being?'³ A question of this kind, a question in which we find a critique (first expressed much earlier) with regard to Husserl's thematization of intentionality,⁴ this question was already implied in the entire enterprise of *Being and Time*, even if one has to add the qualification that a formulation of this kind also hides – retrospectively – the path actually pursued in the course of almost twenty-five years. In fact, what underwent a change between 1927 and 1949 was not so much the interpretation of the ekstasis or of the ekstasis as rather that of the open itself, the openness of being. As Jean Beaufret said himself of this development, everything turns on ἀγῆθεια. This will be the proposition which we shall want to test here.

Can one legitimately argue in talking about *Being and Time* that everything already turns on the ever more refined understanding of this central term? Or again, formulated in interrogative terms: how is one to

understand Heidegger's remark in the *Parmenides* (GA 54, p. 42): '*Being and Time* represents that first attempt to think being on the basis of the fundamental experience that being has remained in a state of forgetfulness . . . '? Naturally, one thinks immediately of the first line of the first paragraph of *Being and Time*: 'The question [the *Seinsfrage*] has today lapsed into forgetfulness.' Gerard Granel correctly emphasizes – in a realm which bears upon the translation, that is, which develops in depth what has been said – that, in a certain sense, the question has always been forgotten because if it is 'out of Plato and Aristotle' that the question gets forgotten, it is also in them and through them.⁵

In the framework of *Being and Time*, how are we then to understand the forgetfulness into which the question of being has lapsed? Why until now – and in Husserlian phenomenology too – has this question been 'overlooked', 'missed' or 'neglected'?⁶ The basis for a first reply, already formulated in the lecture of 1925, and which constitutes a guiding motif for *Being and Time*, is furnished by the (problematic) concept of *Verfallen*, 'fallenness', or better, 'falling'.⁷ In the *Prolegomena*, it is *Verfallen* which is employed to explain, in the final instance, the breakdown of the Husserlian enterprise, attributable to two major 'omissions': the omission of the question of being as such and the omission of the question directed towards the being of intentionality. This is not, Heidegger notes,

an accidental neglect for which philosophers can be held to account. Rather, this history [*Geschichte*] of our being-there is itself revealed across such omissions. History interpreted not as a totality of official events but as a mode of becoming [*Geschehensart*] of being-there itself. Which means that being-there, in the mode of being of falling [*Verfallen*] – a mode of being which cannot be avoided – cannot have access to its being unless it stands opposed to the latter.

(GA 20, pp. 179–80)

Let us leave in abeyance the question of whether this concept of *Verfallen*, however decisive it might be with regard to the determination of the mode of being of *Dasein*, suffices to open up for us a way of acceding to the problematic of the forgetfulness of being, and try instead to determine more exactly the phenomenological feature of that question which arises in connection with the meaning of being. In the debate conducted by Heidegger with and against Husserl, the crucial point concerns the determination of what constitutes the proper subject matter (*Sache*) of phenomenology, or even of the rigorous and consequential interpretation of its leading maxim (*zu den Sachen selbst*).⁸ If the critique directed by Heidegger against Husserl can be regarded as radical, it is because, and only to the extent that, it is conducted in the name of phenomenology, in full recognition of the task which belongs to it and

in strict adherence to the maxim enunciated for the first time in the *Logical Investigations*.⁹ This is why, after reaching the extreme limit of each of his attempts at a critical dismantling, Heidegger could at the end always admit (this is a principle which still regulates the complex structure of paragraph 7 of *Being and Time*, including the final note): 'This obviously doesn't mean that we are not Husserl's disciples and intend to remain so.'¹⁰

If Husserl's phenomenology is not sufficiently radical, this is because it isn't sufficiently phenomenological, forgetful of its own guiding maxim for which Husserl from 1913 will substitute another principle, the 'principle of principles' (*Ideas*, §24), the 'principle of evidence'. With Husserl, phenomenology adopts intentionality as its special field of investigation, but without ever raising afresh the question of the being of intentionality. In fact, not only does Husserl's determination of consciousness as an absolute being in the sense of absolute givenness (*Ideas*, §§44–6) make it impossible to determine 'what being means here', what 'absolute being' means (*GA* 20, p. 140), it also entirely eliminates a question which, in truth, can no longer be posed once Husserl has aligned his phenomenological investigation with a preconceived idea, the modern (Cartesian) philosophical idea of an absolute science for which consciousness precisely constitutes the privileged object.

The fundamental question for Husserl is not at all that of the being character of consciousness. What is fundamental for him is rather this consideration, this question: how can consciousness in general become the object of an absolute science? What is fundamental and directive is the idea of an absolute science. This idea that consciousness has to be the region for an absolute science is not invented haphazardly. Rather, it is the idea which has preoccupied modern philosophy since Descartes.

Heidegger draws from this the decisive conclusion that, so far from being derived phenomenologically by way of a return to things themselves, the elaboration and the validation of pure consciousness as the thematic field for phenomenology remains the 'function of a traditional conception of philosophy' (*GA* 20, p. 147).

It is because it calls in question this subordination of phenomenology to the Cartesian idea of an absolute science – and therefore of a science of consciousness in its irrecusable self-presence – that Heidegger rejects the Husserlian interpretation of the reduction (*GA* 20, p. 151).¹¹ The critique here is founded on the fact that, in Heidegger's eyes, the Husserlian *epoché* 'deprives itself (methodologically) of the very basis upon which alone the question of the being of intentionality can be worked out'. The analytic of *Dasein* – as one knows – is precisely intended to

furnish such a basis. By defining being-there as being-in-the-world, it does in fact become possible to address the question of the being of intentionality.

If intentionality is to be questioned concerning its mode of being, it is necessary that the being which is intentional should be given in an original way, that is to say, experienced with regard to its way of being [*in seiner Weise zu sein*]. The original ontological relation to that being which is intentional first has to be mastered.

(GA 20, p. 152)

It is therefore on the basis of the Husserlian conception of phenomenology, while at the same time taking account of the fundamental omission from which it suffers in not elucidating in advance 'intentional behaviour and everything implied by it', that the question of being makes itself known phenomenologically as the question of the being of intentionality and the question of the meaning of being in general.

The question of being is not an arbitrary question. It is not a question which can simply be envisaged as one among other questions. Rather, it is the most urgent of all questions, and this in the full sense of phenomenology itself.

(GA 20, p. 158)

In the end, the only decisive reproach directed by Heidegger against Husserl is that of not having been sufficiently phenomenological and so, against the very principle of phenomenology, of having failed to work out the theme which legitimately belongs to it as its authentic point of departure: intentionality. 'Phenomenology – or so Heidegger would have it – is therefore with regard to the fundamental task of determining its own proper field of application, non-phenomenological, in other words, only pseudo-phenomenological!' (GA 20, p. 158).

The background constituted by the sustained debate with Husserl through the Marburg years makes it possible for us today to situate more exactly the phenomenological impact of *Being and Time*. If the fundamental phenomenological question – the one which draws all the consequences of the Husserlian enterprise or better of the 'breakthrough' represented by *Logical Investigations* – is that of knowing 'what being means', if it is a matter first of all of 'working out the "phenomenon of being" which precedes and so is determinative of the entire ontological enquiry',¹² there then arises the possibility of rereading the master work of 1927 from a phenomenological standpoint. How is it with this 'phenomenon "being"' (*dieses Phänomen "Sein"*)? Heidegger asked in 1925. What

is the phenomenality proper to being and how is being phenomenalized? Is this simply a way of talking, an approximate formula which has capitulated to the jargon characteristic of the phenomenological school? In *Being and Time* certainly, it is also a matter of the phenomenon of the world, of the phenomenon of anxiety, of care, etc.! But is it enough to underline the ambiguity, the equivocal character of the expression? Or does one, on the contrary, have to recognize the special right of being to be called 'phenomenon'? But then in what apparently peculiar sense should one understand the word 'phenomenon'?

With a view to trying to reply with some degree of precision to questions formulated all too abruptly, it would be appropriate to re-examine the way in which the being question is sketched out concretely in the introductory chapter of *Being and Time* and to follow, step by step, the movement through which the question is posed by attending to the formal parameters of the question and of its articulation.¹³ We will restrict ourselves here to an examination of Heidegger's overt expressions rather than steps actually taken, by limiting ourselves to the elaboration of the strictly phenomenological concept of the phenomenon.

How is the Heideggerian concept of the phenomenon to be distinguished from that of Husserl? Paragraph 7 of *Being and Time* is well known and has been only too amply commented on. We shall have to revert to it for a moment however because it is this paragraph, together with paragraph 9 of the *Prolegomena* (*Die Klärung des Namens 'Phänomenologie'*), which throws light upon the novelty and the scope of the Heideggerian interpretation of phenomenality, especially if one situates it in the context of the Introduction. Even if, or better, precisely because, in this paragraph, Heidegger first sets out phenomenology as a methodological concept, one has to guard against seeing in this text a development which is essentially methodological and susceptible of being separated without great loss from the development of the work as a whole.¹⁴ To be sure, the word 'phenomenology' should not be understood in the sense of such composite expressions as theology, ontology, sociology, etc., expressions characterizing the object of a particular field of research and which predetermine the content or the reality (*Sachhaltigkeit*) of a region or a domain of objects. Taken at this level of generality, as a science of phenomena, phenomenology could designate any scientific research, provided it is true that (relying upon the vulgar meaning of the concept of phenomenon) phenomenology can legitimately qualify 'any research which brings to light beings insofar as they make themselves manifest' (SZ, 35). What then distinguishes phenomenology 'as method' from the vulgar conception – and with a view precisely to applying a 'direct method of showing and validating' – is, first of all, the explicit thematization of its research, of its 'procedure'. But if one concentrates in this way upon the problematic 'formula' of its point of departure, its

development, its mode of access (*Ausgang, Durchgang, Zugang*), this is in fact always because the guiding question is the non-methodological question concerning phenomenality in general.

To be sure, in *Being and Time*, the analysis looks at first like a purely terminological analysis (cf. also *GA* 20, §9), in the sense that Heidegger interprets the very word phenomenology (which he analyses out into its constitutive elements). But this is only a first step which comes close to concealing the peculiar character of the movement of thought in this paragraph, which latter only emerges if one recalls that the word to be explained speaks Greek and that, before and above all else – the phenomenological circle if you want – it is a matter of learning how to listen to what is said with a Greek ear. A later remark by Heidegger is particularly clear on this score.

Direct experience with phenomenology acquired in the course of discussion with Husserl made it possible for the concept of phenomenology to be forged in the manner in which it makes itself known in the introduction to *Being and Time* (§7). Here the reference to the fundamental words of the Greek language, words which are interpreted in this context (λόγος = make manifest; φαίνεσθαι = show itself) played a determining role.

(*Qu IV*, p. 181)

In fact, listening to the Greek is already for Heidegger a matter of making a phenomenological commitment to the business of phenomenology. This is where we enter into the circle. The fundamental attitude, which is phenomenology, permits us to reconquer for the whole of philosophy a more original interpretation of the leading Greek words. Conversely, the more persistently we listen to what the Greek says, the more we are able to radicalize both the point of departure and the concept of phenomenology. At Cérisy, in 1955, Heidegger used these words to explain what might at first have passed for a rather scholarly linguistic analysis.

The Greek word only opens up a path in virtue of its being Greek. . . . In the case of the Greek language, what is said is, at the same time and in a special way, what that which is said calls by its name. . . . By means of the word, heard with a Greek ear, we are already directly in the presence of the thing itself, there before us.

(*Qu II*, p. 20)

What are the Greek words directly questioned and conjured up by Heidegger to elucidate 'phenomenologically' the very term

phenomenology? What is, in the final analysis, the function of the concept of ἀλήθεια?

The phenomenon of phenomenology can be elucidated in the first place on the basis of the Greek word φαίνόμενον, itself taken as a synonym for τὸ ὄν: what shows itself from itself, in itself, as itself. What shows: itself. This is certainly a formal determination but a decisive one all the same, since it is on the basis of this first sense of auto-manifestation that the other, in fact derivative, concepts of manifestation can be interpreted or reinterpreted. The return to the Greek, underscoring the opposition between φαίνόμενον and φαίνόμενον ἀγαθόν for example, allows, or indeed requires, that one make a first distinction between phenomenon and appearance (*Phänomen–Schein*). If phenomenon is in fact defined from the first as ‘that which shows itself from itself’, it is nevertheless necessary to recognize ‘this remarkable possibility that the entity shows itself precisely as that which it is not’ (GA 20, §9). What has to be noted here is that the appearance is itself what it is only in virtue of the fact that it is upheld by phenomenality, understood in the strict and primitive sense of auto-manifestation. ‘There is only as much appearance as there is being’, Heidegger notes.¹⁵ It is only because φαίνεσθαι means, in the first instance, *Sichzeigen* (self-showing) that, in the second instance it can also characterize something as passing for, seeming to be, looking like. . . . The contraposition of phenomenon and appearance is therefore intended in the first instance to bring out the original and fundamental sense of phenomenon: *das an ihm selbst offenbare Sein* – ‘being itself just as it is manifest in itself’.

This first distinction is certainly decisive but it remains insufficient and formal to the extent that it still leaves entirely open the question of the phenomenality proper to the phenomenon as such. This elementary proposition does however possess a second obvious merit. It makes it possible, or so it seems, to eviscerate as secondary such Kantian concepts as *Erscheinung* and *bloße Erscheinung*. *Erscheinung* – indicative phenomenon, appearance – in as much as, in announcing something it attests to something else which does not appear, assumes the form of a symptom, of an indication. The *Erscheinung*, qua appearance of – possesses a referential structure. *Anzeigen von etwas durch etwas anderes* – an indication of something which can only make itself known mediately by way of something else, a presentation which is both differed and destined to remain indirect. But even here *Erscheinung*, in the sense of an indicative phenomenon, is founded, in terms of its very possibility – at least if the indicative phenomenon is to make its appearance as such, that is, fulfil its mission, accomplish its indicative function – upon the phenomenon in the first and most fundamental sense.

It is therefore necessary to dismantle, to untie this indicative structure of *Erscheinung* (reference but also substitution, supplementation, rep-

resentation, if one wants to isolate the φαινόμενον (= τὸ ὄν) in its purity and its specificity.

In the lectures of Summer 1927 (*The Basic Problems of Phenomenology*), as in *Being and Time*, *Erscheinung* can always be interpreted in terms of the Kantian distinction between the 'phenomenon' and the 'thing in itself'. In this framework, which Heidegger hopes to dismiss definitively, phenomena would conceal as much as they would reveal something which, while remaining in the background, would be more 'stable', would contain more being without, for all that, the phenomena taken in themselves being reduced to nothing. Behind the phenomena there would always be something of which they would precisely be the phenomenal manifestations, in the sense of appearances or ap-pearances.

We can ignore here the supplementary distinctions introduced by Heidegger with a view to elucidating the ambiguity of the German word *Erscheinung* – in particular, the metaphysical distinction of *Erscheinung* (indicative phenomenon) and of *bloße Erscheinung* (pure appearance) – and so simply hold on to the basic opposition between the phenomenon (φαινόμενον, *Phänomenon*) and the appearance (*Erscheinung*). Phenomenon characterizes a special mode of presentation or of encountering something in as much as, *qua* phenomenon, the thing manifests itself in itself, manifests itself *in truth, just as it is*. When it is a matter of *Erscheinung*, on the other hand – of the appearance or the indicative phenomenon – we are always referred to something else, to a second reality which is no doubt announced, trans-appears or ap-appears, but which precisely never shows itself in itself.

Such an analysis – Heidegger lays particular stress on this – unfolds at first in a purely formal manner (formal rather than terminological). It tends to disengage the pure concept of the phenomenon while leaving the question of determining what is intended, *qua* phenomenon, entirely indeterminate. A being or a character of being? asks Heidegger. But before tackling this question, it is necessary to envisage different possible applications of the 'vulgar' concept of phenomenon and of the 'provisional' (or 'preliminary') (*Vorbegriff*) conception of phenomenology, such as is handed down to us in the obligatory, though mistaken, framework of a Kantian exemplification. This also means that such an exemplification is necessarily paradoxical (it would surely be possible to dispense with the thematic of *Erscheinung*, since it is understood in advance as secondary) and as such might well lead us astray.

Heidegger notes,

That which already shows itself in the appearance as prior to the 'phenomenon', ordinarily understood, and as accompanying it in every case can, even though it thus shows itself unthematically, be brought

thematically to show itself; and what thus shows itself in itself (the 'forms of intuition') will be the 'phenomena' of phenomenology.¹⁶

This first pre-determination must not be confused with the second, the true explanation (itself no doubt still ambiguous), of the phenomenon of phenomenology: what precisely does not show itself and which remains hidden, covered over, without ever entering in any way into the transitive structure of reference, of trans-lation or of trans-position. The being-concealed of the phenomenon of phenomenology – that which, in the first instance, and for the most part does not show itself, that which, with regard to what shows itself, remains in retreat, that which withholds itself – this in-apparent phenomenon, even if it can be apprehended in the Kantian framework as 'that which belongs essentially and simultaneously to what shows itself because it constitutes the meaning and the foundation of the latter' (SZ, 35 B), cannot be understood on the basis of the Kantian thing in itself, since the latter is 'essentially incapable of ever manifesting itself'. The non-manifestation of the thing in itself therefore possesses a structure which is radically different both from that of the phenomenon in the sense of the non-thematic, and from that of the properly phenomenological phenomenon, the phenomenon in retreat or covered over. 'The phenomenon' – Heidegger notes – 'as the indicative phenomenon of something, does not mean simply what manifests itself but the announcement of something which does not manifest itself by means of something which does manifest itself' (SZ, 36 A). If the showing of the phenomenon of phenomenology is not that of the Kantian *Erscheinung*, the remaining concealed or covered over proper to the phenomenon apprehended in its phenomenological concept (being or the being of beings),¹⁷ can no longer be identified with the non-manifestation of the thing in itself. What is it then which truly characterizes non-manifestation, in the phenomenological sense? What is the reason for its 'being-hidden'? Before returning to this important point, we shall have to follow Heidegger in his second approach to phenomenology by way of the key concept of the λόγος.

Here again – it has to be emphasized – the λόγος is itself interpreted 'phenomenologically' in its 'veritative' or 'demonstrative' dimension as what makes things or lets things be seen, as ἀποφάνσις. It belongs essentially to the λόγος, as Plato had established, to make manifest (δηλοῦν).¹⁸ The primordial function of the λόγος is de-monstrative or de-clarative, not in that it is effectively preferred but because it belongs to it constitutively to bring to light. It is *Aufweisung*. The λόγος shows, or better, shows what shows itself on the basis of itself and in itself. Why is it always necessary to show (and to show anew, as we shall see, over and over again) what precisely shows itself? To reply to this question

no doubt means being able to delimit (that is, trace the outlines but also mark the limits of) the Heideggerian interpretation of phenomenality at the time of *Being and Time*. Let us say, again quite crudely and provisionally, that what shows itself (the phenomenon) does in reality stand in need of that self-showing which is operative in the λόγος, to become entirely manifest, to be manifested. The ἀπόφανσις is precisely what renders manifest. It lets things be seen in as much as it brings to light (*aufweisendes Sehenlassen*). The proper task of the λόγος is ἀληθεύειν. To show itself, to articulate itself constitutes one of the privileged figures of ἀληθεύειν¹⁹ in the sense of discovering, withdrawing from its retreat, letting the being in question be seen as ἀλήθες (dis-interred, dis-closed). Such is, for Heidegger, the basic apophantic feature of the λόγος, the one which makes διαίρεσις possible, just as it does the σύνθεσις.

It is because the function of the λόγος as ἀπόφανσις consists in letting be seen what brings to light that the λόγος, is able to assume the structural form of the σύνθεσις. . . . The σύν possesses here a purely apophantic signification and means: letting something be seen, in its being together, as something.²⁰

The truth of the λόγος as speech, discourse, judgment always refers to a being-true or confirmation which belongs originally to the λόγος, even though the latter arises in its turn from ἀληθεύειν, which consequently assumes the form of making/letting be seen, discovering as uncovering (ἀλήθες) the being in question by letting it show itself from itself. To the extent that it dis-covers, brings to light, it can happen that the λόγος deceives or misleads in the sense of covering up. 'To place something in front of something else and so let it be seen and in this way to pass off the thing covered over as something which it is not [*Schein*].'²¹ This is the double play *Phänomenon*–*Schein* which makes discourse possible as true or false, on the assumption that *Schein*, even if it stands opposed here to the phenomenon, nevertheless only constitutes a degraded form of the latter.²²

The λόγος brought back in this way to ἀληθεύειν, apprehended in all its fullness and in accordance with its multiple guises, ceases to appear as the privileged and primordial locus of the truth, but presupposes, in virtue of its being the λόγος, a more original mode of dis-covering, that of touching/seeing, pure and simple, of naming. θίγειν καί φάναι;²³ αἰσθησις as a direct grasp of the ἰδέα, the νόησις understood as an immediate apprehension of the ἅπλα, are always dis-covering, always true.²⁴ It's the συμπλοκή, the σύν of the λόγος as λέγειν τι κατὰ τινος, letting something be seen as this or that, which opens up a space for the *Schein*, that of a giving itself out as – presenting itself as.

The 'terminological' elucidation of phenomenology, whether it takes

its cue from the φαινόμενον or the λόγος, indicates, in every instance, that the λόγος constitutes the decisive background for phenomenality in general, provided only that it always ends up by working out one and the same formal concept of the phenomenon along convergent lines and so furnishes a first, and equally, formal determination of phenomenology (λέγειν τὰ φαινόμενα = ἀποφαίνεσθαι τὰ φαινόμενα).

As we have seen on the occasion of our distinction of the phenomenon and *Erscheinung*, there is nothing behind the phenomena. There is no other side to the phenomena. They don't conceal or hide anything. One could therefore never go behind the phenomena to find . . . what? Indeed it belongs to the very essence of the phenomenon to show and to show itself, to give and to give itself in itself.²⁵ The first move designed to recover the phenomenological acceptance of the phenomenon is a flattening move. The phenomenon is always one-dimensional.

But if the phenomenon is self-giving and, by virtue of that very fact, gives the thing itself – just as it is – it can however be that the phenomenon does not give itself or show itself. It can happen that what of its own accord should be brought to light remains hidden.

What is in itself visible and which ought to be luminous can very well remain hidden [*verdeckt*]. What in itself is visible and which is only accessible *qua* phenomenon in conformity with its meaning does not necessarily have to be accessible in fact. That which, in accordance with its possibility, is phenomenal, may precisely not have been given as phenomenon, but has yet to be given as such.

That which, in itself and in principle is *given* has yet to give itself. One has to give oneself phenomena, that is, what gives and gives itself! Why and how is one to give oneself what gives itself? Precisely because what is given does not give itself in the first instance and frequently not at all. This – the gift or the presence of the thing – remains in retreat, in the background, concealed.

One might well ask what, upon the plane of phenomenality, founds such a reticence, such a holding back or reserve? One has to admit, I think, that *Being and Time* does not throw much light on this point. The tendency toward recuperation, the tendency which is in question here, arises entirely out of the *Dasein* to which it is attributed straight off. This tendency responds in turn to the ontological constitution of being-there, to whom the characteristic of falling (*Verfallen*) belongs essentially. It's the mode of being of *Dasein* which explains why what gives itself is in reality always already covered over and in such a way that any letting/making itself be seen, if it is to be 'carried through methodically', will

always assume the form of a destruction or better of a deconstruction in the strict sense of that word (*Abbauen der Verdeckung*).

So one has to complete the first formal determination of the phenomenon and its phenomenality (the phenomenon is what, of itself, manifests itself in itself) with this other not less decisive thesis: being covered over, dissimulation is the *Gegenbegriff zu Phänomenon*²⁶ – not just simply the contrary of the phenomenon, its contradictory, but rather the counter-concept of the phenomenon and in this sense its complementary concept, the one which corresponds to it exactly as its *vis à vis*. But whatever can be a phenomenon is in the first instance and most frequently hidden and covered over. This covering over (*Verdeckung*) is itself capable of taking many forms, from dissimulation or masking (*Verstellung*) through internment, veiling (*Verschüttung*), to complete obliteration and forgetfulness.

If the possibility, even the threat, of covering over, belongs essentially to the very structure of phenomenality, it is because 'phenomena which have originally been perceived are later uprooted, torn away from what constitutes their ground'. Detached, expropriated in this way they 'remain unintelligible with regard to their true source'.²⁷ The phenomenon is naturally exposed to loss, to an obfuscation which enters into its transmission and becomes its tradition. This threat weighs permanently upon every phenomenon as such.

The covering-up itself, whether in the sense of hiddenness, burying, or dissimulation, has in turn two possibilities. There are coverings-over which are accidental; there are also some which are necessary, grounded in what the things so discovered consist in. Whenever a phenomenological concept is drawn from primordial sources there is a possibility that it may degenerate if communicated in the form of an assertion. It gets understood in an empty way and is thus passed on, losing its indigenous character and becoming a free-floating thesis.²⁸

But if it is both possible and legitimate to distinguish between coverings-over which are accidental and coverings-over which are necessary, still it has to be conceded that the covering-over which permanently threatens the phenomenon in the originality of its showing is necessary. No phenomenon can show itself once and for all. Consequently, what shows itself must always show itself anew (on the basis of its offering source, of the *Sache selbst*). Covering-over is so far unavoidable that it is 'given with the mode of being of uncovering, and of its possibility'.²⁹ Hence the essential fragility of the phenomenon, tied as it is to its obliteration, to its inevitable obfuscation. For us, the originality of the phenomenon has therefore to be continually recuperated against its almost necessary degradation or degeneration, since it is only the shadow thrown by

Verfallen, which latter features as a trait constitutive of our mode of being.

This implies naturally that the 'specific confrontation with the mode of the phenomenon has to be obtained in the first instance for all objects of phenomenological research'.³⁰ Since the phenomenon is never given nor secured in its phenomenality, the latter has always to be painfully reconquered, withdrawn from a multi-form covering-over. Here again, it is the peculiar structure of phenomenality which explains the necessarily methodical character of phenomenology. Things themselves are not given; still less are they given immediately in intuition, made available to a 'pure and simple' seeing. The phenomena have to be liberated. They can only be disengaged at the end of a development which seeks precisely to undo the dissimulations and disguises.

Zu den Sachen selbst – on the way to the phenomena and to the phenomenon κατ' ἐξοχήν, the phenomenon 'being'!

On the assumption that this general response to the question of the Heideggerian determination of the phenomenon has been admitted in principle, one can still ask why, in *Being and Time*, Heidegger develops a 'preliminary conception' or a 'provisional' concept of phenomenology, itself characterized as 'universal ontology'. Does Heidegger stick to this preliminary conception? What would a 'definitive' conception of phenomenology be like?

It should be noted first of all that neither in the *Prolegomena*, whose introductory section nevertheless establishes the context for the most sustained debate with Husserlian phenomenology, nor in the lecture course of the Summer term 1927 (*Basic Problems of Phenomenology*) does one find this distinction between the preliminary conception and the idea of phenomenology – even if in the latter an exposition of the idea of phenomenology is announced – though without ever being carried through. Why this distinction in *Being and Time*? The first reply which occurs to us is the one which Heidegger presents at paragraph 69. The complete exposition of the idea could not take place until 'the central problematic' of being and of truth had been brought to light, that is, until the close connection between being and truth had been explained and the existential concept of science had been developed. Phenomenology was in fact initially defined as the method of ontology, that is to say, of *scientific philosophy*.

Let us elaborate a little to confirm that this idea of a 'scientific philosophy' – phenomenology is scientific philosophy, science *par excellence* – must naturally not be allowed to conceal the opposition in principle between phenomenology, on the one hand, and the totality of the 'positive' sciences, on the other, that is to say, of all those bodies of research which bear upon an entity or a region of being which has already been

determined, brought to light. In his Tübingen lecture (1929), 'Phänomenologie und Theologie', Heidegger works out this radical difference between the positive sciences which are ontic in character and a phenomenological enquiry which is ontological and does so by way of a conceptual apparatus which is precisely phenomenological and close to that of Husserl. A phenomenological enquiry is required first of all to provide its own theme (the phenomenon, i.e., the phenomenon 'being').

The idea of science in general, to the extent that it is conceived as a possibility of being-there, shows that there are necessarily two kinds of science which are possible in principle: science of beings, ontic sciences – and the science of being, ontological science, philosophy. The ontic sciences each assume as their theme a given entity which is always disclosed, in a certain way before the disclosure effected by the science. We shall call the positive sciences the sciences of a given entity, of a *positum*. It is characteristic of such sciences that the objectification which they assume as their theme goes straight to the entity, by prolonging the pre-scientific attitude which already exists towards this entity. The science of being, on the other hand, ontology, calls for a fundamental conversion of attitude toward the entity in question. From the entity, the attitude shifts to the being of the entity. Nevertheless, the entity still remains the object of attention despite the change in attitude.³¹

Having finished with this point, let us return to paragraph 69. One can now understand why the finished conception of phenomenology can only be presented at the end, in the form of an idea, when the meaning of being and of truth have been explicitly developed, when the truth of being has been exhibited. If it is the case that phenomenology furnishes the method which responds to what is required (the question of the meaning of being, the question of the truth of being), one understands that the provisional concept cannot and should not give way to the idea until its own characteristic phenomenon has been disengaged. One can also explain in a very (too?) general way the claim to the necessity of a recuperation of the provisional concept by the idea, by underlining what, in the movement of *Being and Time* (what therefore also belongs to the internal logic of the enterprise which unfolds therein), is propaedeutical, preparatory or precursory. At paragraph 5 ('The ontological analytic of *Dasein* as the laying bare of the horizon for an interpretation of the meaning of Being in general'), Heidegger indicates for example that if 'an analytic of *Dasein* remains the first requirement in the question of being' and if therefore the analytic, so conceived, is 'entirely oriented towards the guiding task of working out the question of being', this analytic in its turn is not only

incomplete, it is also, in the first instance provisional [*vorläufig*]. It merely brings out the being of this entity, without interpreting its meaning. It is rather a preparatory procedure by which the horizon for the most primordial way of interpreting being may be laid bare.

Once this interpretation has been carried through or, more cautiously, once this horizon has been disengaged, this 'preparatory analytic of *Dasein* will have to be repeated on a higher and more authentically ontological basis'.³²

But this reply is undoubtedly too general and, as such, remains insufficient. In order to show this, the question at issue here will have to be reformulated in a more topical fashion. If it is important to represent the provisional concept of phenomenology as a methodological concept in its role as a guiding idea, is this not because the phenomenological characterizes, in the first instance and before all else, the initial step, the first move, the bias or the detour which aims at opening up an access to being in general and, quite specifically (reading the meaning of being off an exemplary being)³³ by way of the analytic of *Dasein*?³⁴

At this point we would like to venture the following hypothesis: the phenomenological method is indeed called for by the matter in hand (SZ 37 D, 38 C), in as much as the latter consists first of all – should it be added, in connection with *Being and Time* alone? – in bringing to light that comprehension of being which belongs constitutionally to *Dasein*, even if only initially in a pre-ontological mode. It is because the question concerning the meaning of being (what is at issue in this question, what it hopes to attain – *das Erfragte*) can only be posed concretely by way of the analytic of *Dasein* – *qua* fundamental ontology – that the phenomenological method becomes critical from the first to any ontological enquiry designed to save the question of being from forgetfulness.

This point emerges clearly, or so it seems, in the following passage from the *Prolegomena* where Heidegger does not hesitate to call the analytic which bears upon that entity which enjoys a privileged status in any ontological enquiry, for any elucidation of the phenomenon 'being', a phenomenology of *Dasein*, not only because it is this entity which poses the question of being which already understands being, but also because it *is* itself this very question, or better still, this questioning (*das Fragen*).

Working out the question of the meaning of being signifies: laying bare [*freilegen*] the one who questions in its capacity as a being, that is to say, *Dasein* itself. For only in this way can that which is sought be investigated in conformity with its own meaning. The one who questions is here co-affected by what the question itself has in mind [*das Erfragte*]. It belongs to the very meaning of the question of being

itself that the being who questions should be affected by what the question aims at. It is in the light of this meaning that it becomes appropriate to take account of the principle of phenomenology, at least if the question of being is going to be posed clearly. The one who questions is expressly given at the same time as the question but in such a way that at the same time and before all else he loses sight of himself in the dynamic of the questioning process. What we are going to try to do here is not to lose sight of this being, not to lose sight of it in the very perspective of [*im Hinblick auf*] the question of being itself. Thus the effective working out of the problematic is a *phenomenology of being-there*. For this very reason there can never be a definitive answer, or the answer can only be hypothetical [*Forschungsantwort*], in as much as the working out of the question concerns the being which includes within itself a *comprehension of being*. *Dasein* is not just the decisive issue from an *ontic* standpoint; it is so from an *ontological* standpoint also, at least for those of us *who are phenomenologists*.³⁵

Thus, this ontological privilege of *Dasein* becomes apparent from a phenomenological standpoint. And if the phenomenological method is to be recommended, it is in the first instance because it corresponds to the demand for a way of acceding to the being of this being which we are ourselves, and because it brings into play that kind of demonstration required by the manner in which this being comes to confront itself.

How does this being – both the closest and the farthest (SZ, 15–16; GA 20, pp. 201–2) – come to confront itself? How is it given to itself? How must it be brought to light phenomenologically with a view to a thematization of the phenomenon ‘being’? The quite specific difficulties which the elucidation of this being (the one who questions) with regard to its being – and in particular its susceptibility to falling – runs up against lie at the root of the application of a phenomenological method (in that formal sense to which reference has been made).

One could then go so far as to say that ontology is only phenomenological to the extent that it is a phenomenology and/or a ‘metaphysics of *Dasein*’.³⁶ The expression *Phänomenologie des Dasein*, an expression that can be found in the *Prolegomena*, has therefore to be strictly understood. It is because it focuses first of all upon *Dasein* and its disclosiveness (*Erschlossenheit*), upon its existence, that the enterprise has to be undertaken in a phenomenological fashion. It is therefore the ontico-ontological ‘primacy’ of *Dasein*, the necessity of an interminable ‘detour’ by way of the existential analytic, which calls for a phenomenological method in the very first instance.

Such a hypothesis immediately encounters a series of massive objections which we cannot, nor do we wish to, overlook. In the

'methodological' paragraph of *Being and Time*, Heidegger characterizes the phenomenon of phenomenology as the phenomenon of being (SZ, 35 C, 35 D, 37 D). Heidegger defines his research, fundamental ontology, as 'universal phenomenological ontology' (SZ, 38 C). He explicitly characterizes phenomenology as the science of being (GA 24, §23). Finally and most important of all, he only introduces the phenomenological method 'formally' with a view to bringing to light what has to constitute its proper subject matter intrinsically (i.e., with regard to its 'actual content' – *Sachhaltigkeit*), namely, the interpretation of the meaning of being. Being therefore becomes in a sense the 'cause', the 'matter' of phenomenology, but only to the extent that it is, in a more original sense, the matter of thinking – *Sache des Denkens*.

Before attempting to reply to these textual objections, objections whose legitimacy certainly cannot be ignored, we would like to follow up the hypothesis for a moment, with a view to bringing out its heuristic value. To insist upon what in *Being and Time* determines, or pre-determines, phenomenology to be a phenomenology of *Dasein* is also to confirm – this point, though familiar, is vital – the inextricable connection, more, the interconnection or the intimate belonging together of the question of the meaning of being and the question of the being of *Dasein* as *Da-sein* (being-there, or *die Lichtungsein*, as Heidegger will call it later).³⁷ It is to weld solidly – and this juncture remains critical to this very day – being and the understanding of being. Being is given – if it is given – as an understanding of being. Independently of this understanding, being is nothing.³⁸

To be sure, what has fallen into forgetfulness is the question concerning being. What has to be considered and worked out with the aid of a complex intellectual apparatus, is the question of the meaning of being. It is nevertheless true that in the perspective of *Being and Time* – the working out of the project if not the project itself – the phenomenological uncovering which is at work has as its initial object *Dasein*, the prior understanding of *Dasein* and of its everyday way of being. It is because, in the first instance and for the most part, *Dasein* is not given that it becomes important to open up an access to the being of *Dasein* and to the meaning of this being.

One of the fundamental features of *being-there* is that 'ontologically the closest and best known'; it is 'ontologically what is farthest and least known' (SZ, 15 C, 43 D, 311 B). In other words, it is that whose 'pre-givenness' (*Vorgabe*) can so little be taken for granted that 'its determination constitutes an essential part of the analytic of this being' (43 B). Far from being immediately evident, the 'right pre-givenness' has to be methodologically mastered by way of a development, a procedure which is as certain as possible about its point of departure and its rite of passage. The existential analytic therefore necessarily possesses

a methodological character (§63), given the formal structure of the *Seinsfrage*, but also the mode of presentation or of de-presentation of this peculiar being. 'The liberation of the originary being of *Dasein* has to be fought for against the tendencies of the prevailing interpretation which is onto-ontologically defunct' (311 B).³⁹ On the contrary, Heidegger continues,

the mode of being of *Dasein* requires of an ontological interpretation which aims at the originality of a phenomenal demonstration that it wrest the being of this being against its own tendency toward a covering-over of its being. . . . Consequently, the existential analytic constantly assumes a violent character.

(ibid.)

What are the consequences of this pre-determination of phenomenology (as a phenomenology of *Dasein*) with regard to the problematic of truth in *Being and Time*?

If paragraph 7 of *Being and Time* ends up (programmatically) with the elucidation of the phenomenon of being, one might hold that paragraph 44, which closes the first section, responds to it and contributes no less decisively to the elaboration of the concept of phenomenology. Not only because the analysis of the λόγος is taken up again and developed but also, and above all, because the bringing to light of the phenomenon of truth (through which the 'originary', or 'the most originary' phenomenon of truth is pursued) contributes in a decisive way to define the subject matter (*sachlich*, *sachhaltig*) of phenomenology.⁴⁰ As Heidegger emphasizes, this paragraph, designed to work out the central problematic of truth, or better, of the essential connection being-truth, does not limit itself to concluding and so closing the first section but gives the research a 'new departure', a second wind (214 A).

If it is true, as J. Beaufret said in 1927 and throughout the later work of Heidegger, everything turns on ἀλήθεια, how exactly is the phenomenon of truth presented in the economy of *Being and Time* and of paragraph 44? The phenomenon of truth is already announced in the context of the preparatory analytic which is the existential analytic of the being of *Dasein*, that is, if, with Heidegger (and the classical problematic of the transcendentals), we recognize that being goes necessarily together with the truth. One must however emphasize that in paragraph 44 the question of the connection of being and truth is only taken up under the much more determinate auspices of the 'originary link' *being-there-truth*. This is moreover confirmed in turn by paragraph 69, in which Heidegger announces the work still to be accomplished with regard to the central question of the belonging together of being and truth. How far therefore should we follow Heidegger when he presents this paragraph 44

as a 'new departure' (214 A) in the general problematic of the *Seinsfrage*? Let us recall schematically the main steps in the movement of paragraph 44: the destruction of the traditional concept of truth, designed to recuperate a more original concept of being-true; the elucidation of the ontological sense of the expression 'there is truth' and of the necessary presupposition that there is truth. To understand the move Heidegger makes in this paragraph and to appreciate what is really at stake, it is important, in our opinion, to stress the examination of the traditional doctrine of truth. This examination culminates in the discussion of the Husserlian problematic (6th *Investigation*, §§36–9) of the verification of a proposition. The identification which lies at the root of the verification of the proposition relates to the fact that 'the being intended shows itself just as it is in itself; in other words, in this that it is dis-covered to be identically the same as it is posited in the proposition'.⁴¹ This confirmation (*Bewahrung*) means in turn 'the manifestation of the being in its identity',⁴² wherein we find once again the formal determination of the phenomenon as φαινόμενον. The proposition ἀποφαίνεσθαι is true (i.e., verified) to the extent that it is apophantical, that is, that it dis-covers, declares the being itself. It lets the being be discovered precisely in its being-discovered. The truth of the proposition is therefore in the first instance that of ἀληθεύειν in the guise of ἀποφαίνεσθαι: letting it be seen, by disengaging it from its being covered over, the being in its withdrawal from retreat (being dis-covered). But the ἀποφαίνεσθαι of the λόγος ἀποφάντικος only constitutes one of the guises of ἀληθεύειν. Being-discovering through speech is a way of being of *Dasein*. But the possibility of the discovery of intramundane reality is itself originally founded in an exchange with those beings which are available (at hand) and the opening up of the world which goes along with the revelation (*Erschlossenheit*) of *Dasein*. With this openness of *Dasein* the most original phenomenon of the truth is attained. *Erschlossenheit* (opening, openness) names this fundamental modality of *Dasein* in accordance with which it is its there.⁴³

The 'aletheiological' teaching of *Being and Time*, in so far as it is presented in this paragraph, can be expounded in three theses. The first thesis: '*Dasein* is in the truth.' Again, and even more explicitly, 'Inasmuch as being-there is essentially uncovering, and inasmuch as, uncovering, it un-covers and dis-covers, it is essentially "true"'. But, for being-there, being in the truth also and especially means being 'in the truth of existence'. This last proposition recapitulates the following points made previously: if *Dasein* is its openness, if *Erschlossenheit* belongs to it constitutionally, the latter is always the openness of *Dasein* in its being-thrown (*Geworfenheit*). Which comes down to saying that openness is necessarily 'factual'. Facticity and being-thrown are therefore in the background of that project by means of which *Dasein*, open to the

potentiality for being (possibilities) and to its own potentiality for being – if it is true that the project is always projective opening – decides and decides for itself. Being in the truth is therewith exposed from the first to the alternative of authenticity and inauthenticity. In authentic opening, ‘*Dasein* can be open to itself in and as its ownmost potentiality for being’. And it is precisely this authentic openness which ‘the most originary phenomenon of truth makes manifest in the mode of authenticity’.⁴⁴

A second thesis is therefore immediately called for: being-there is in un-truth, from the moment that falling belongs to its ontological constitution. ‘The ontological constitution of *Dasein* is characterized by falling. From the very first, and for the most part, being-there is lost in its “world”.’ Caught up with intramundane beings, being-there allows itself, literally, to be taken. Heidegger continues:

Understanding, as a projection upon possibilities of being, has diverted itself thither. Its absorption in the ‘They’ signifies that it is dominated by the way things are publicly interpreted. That which has been uncovered and disclosed stands in a mode in which it has been disguised and closed off by idle talk, curiosity and ambiguity. Being towards entities has not been extinguished but it has been uprooted. Entities have not been completely hidden; they are precisely the sort of thing that has been uncovered, but at the same time they have been disguised. They show themselves, but in the mode of semblance.⁴⁵

The dissimulation in question here, and which arises from inauthentic existence, which is itself certainly covering, runs the risk of being substituted for re-covering (*Verdecktheit*), defined in the first instance as the ‘counter-concept’ (*Gegenbegriff*) of the phenomenon. So one can very well ask whether the analysis of inauthentic existence does not constitute an *impasse* for a thinking which wants to be more attentive to both the reality and the status of the appearance.⁴⁶

In *Being and Time* in any case, it is as a function of its ontological constitution, characterized by openness but also as being-projected, project, falling, that one can understand why being-there, to the extent that it is from the first in the truth or in un-truth, always has to appropriate over again and ‘against appearance and dissimulation’ that very thing which has already been concealed in advance.

The facticity of being-there, to which closedness and re-covery are attached, comes to the fore in this way. If the truth has to be ‘wrested from being’, ‘torn away from its retreat’, if ‘factual dis-covery is in every instance, so to speak, a “seizure”’, this is because the phenomenon of truth is veiled from the first. Falling dissimulates the phenomenon as such in the appearance. This is also why the mode of being of openness is always thematized in accordance with one of its secondary

modifications which then takes the lead over all the others, the proposition and its apophantical 'as'. In this way truth is determined on the basis of, and in opposition to, the re-covering attributable to 'fallen' *Dasein*. At the time of *Being and Time*, Heidegger thought he could even find a confirmation of this analysis in the privative expression of the 'truth' with the Greeks. By way of the term ἀλήθεια, what makes itself known is 'the pre-ontological comprehension that being in un-truth constitutes an essential determination of being-in-the-world'.⁴⁷

To claim that *Dasein* is equi-primordially both in the truth and un-truth, is to affirm, in addition (the third thesis), that the truth must be counted among the *existentia*. It is in fact always 'made to *Dasein*'s measure' (*daseinsmässig*), and despite the fact that it is dis-covering/re-covering.

The connection between being and the truth, towards which the entire undertaking in *Being and Time* is directed, can only emerge if one has first established the necessary reference of the truth to being-there. In the same way that being refers to something like an understanding of being, the truth is always relative to a stance, an attitude or a decision on the part of being-there. This is why Heidegger can uphold the parallel thesis that 'there is truth only to the extent that and as long as being-there exists' and 'there is being – not beings – only as long as there is truth'. Being and truth, if they exist at all, are 'equi-primordial'.⁴⁸ In reality, and Heidegger makes a great deal out of this from 1927 on, neither being nor truth exist. There is being and truth, or again, being and truth take place. But if one tries to clarify this taking place in the retrospective light of the problematic of the topology of being, one has to appreciate that its proper locus is being-there itself rather than *Lichtung*, a being-there which is permanently confronted with the alternative of authenticity and inauthenticity.

Why, one might ask, does Heidegger, in *Being and Time*, stick to the preliminary conception of phenomenology without ever managing to expound his idea? To such a question one is tempted to reply, in retrospect of course, in the following manner: if, in *Being and Time*, phenomenology does not arrive at its idea, it is perhaps because it is developed under the auspices of a phenomenology of *Dasein*, as a result of which it falls short in a certain fashion of its central theme, the phenomenon 'being'.

Is it because the work remains unfinished, dedicated in essence to the preparatory analytic of being-there, to the elucidation of its meaning of being, and only in this way to the foundation of the *Seinsfrage* in the name of fundamental ontology? No doubt; but the question still stands whether this abbreviation, this way of proceeding, was designed to prepare the way concretely for the reversal (implied by the second point of

departure in paragraph 44), the turn that the third section of the first part was supposed to effect.

In other words, and giving the issue a polemical twist into the bargain, one might ask whether the later remark by Heidegger on the subject of the analysis of the surrounding-world and of the everydayness of the world – to wit, that it certainly constitutes an ‘essential discovery’, but that it only retains a ‘subordinate signification’ to the extent that it only represents a ‘concrete way of approaching the project . . . which, as such, does not entail an analysis of this kind except as a means which is itself secondary with regard to the project’,⁴⁹ – one might well ask whether such a remark could not be applied to numerous concrete analyses undertaken in *Being and Time*, including the analysis of the ‘phenomenon of truth’.

To be sure, Heidegger himself never says anything of this kind. On the contrary, he is inclined to suggest the contrary, as witness for example this indication from his UNESCO lecture: ‘In what way the attempt to think a given state of affairs can sometimes go astray and deviate from what has already been incontrovertibly demonstrated is attested here by the following text from *Being and Time* (SZ, p. 219): “the translation [of the term ἀλήθεια] by the term ‘truth’, and in particular the conceptual and theoretical definitions which go along with it, recover the sense of what the Greeks considered as taken for granted in their terminological employment of ‘ἀλήθεια’” (Qu IV, p. 134 n.).’ But what had already been demonstrated? To stick to the texts, nothing other than the elucidation of the essential connection between being and truth on the basis of the truth of existence. If, in a certain fashion, *Being and Time* misses the phenomenon of being, this is also because it misses the phenomenon of truth. It is, as we have seen, being covered over (*Verdecktheit*), itself interpreted in the framework of the thematic of *Verfallen*, which is held responsible for determining the counter-concept of the phenomenon.

If then, from the standpoint of its guiding idea, phenomenology, in Heidegger’s sense, is not to be distinguished from *aletheiology*, one has to push things as far as doubting whether *Being and Time* is still sufficiently phenomenological because it does not confront the question of ἀλήθεια – understood in such a way that λήθη makes up its root meaning. If *Being and Time* brings ἀλήθεια to light by defining the openness (*Erschlossenheit*) of being-there or better still by defining being-there by means of this openness as the one who is its ‘There’, then truth thereby becomes an *existentialia*. It is in fact being in the world, as Heidegger emphasizes, which constitutes ‘the foundation [*Fundament*] of the original phenomenon of truth’.

To work out the idea of phenomenology would then perhaps amount to deepening the phenomenon of truth, or again, thinking what the essay ‘On the essence of truth’ called the ‘non-essence’ [*Unwesen*] of the truth’,

thinking to the end the forgetfulness of being (of which it would no longer be possible to say that it represents the fundamental experience of *Being and Time*), thinking being in its withdrawal, its suspension, its reserve, its epoch, its absence.

If, in 1927, Heidegger still falls short of the 'phenomenon of being', this is no doubt because he has not yet taken account of the peculiarity of this strange phenomenon which precisely does not manifest itself. Being remains in retreat, hidden, missing. Being is missing and not accounted for. It has fallen into forgetfulness. If this was indeed the fundamental experience of *Being and Time*, one would still have to insist that Heidegger's entire enterprise was aimed at drawing being out of this forgetfulness, tearing it away from its retreat, by undoing whatever might have contributed to the obfuscation, the dissimulation of its phenomenality.

In fact, it is not until much later, at the end of what might be characterized in a sense as a total reversal, a *Kehre*, that Heidegger ventures to think that if being remains in retreat, if it is missing, this deficiency could well be due to being itself.⁵⁰ Being withdraws certainly, but such a withdrawal is precisely the withdrawal of *being*.⁵¹ It belongs to the phenomenality of being to withdraw.⁵² What is truly 'epochal' is phenomenality itself.⁵³

The phenomenological enterprise has to be radically modified. In fact, if 'concealing itself belongs to the predilection of being, that is to say, to that in which its essence is founded',⁵⁴ it could no longer be a matter of bringing to light what remained concealed, of remorselessly wresting from its retreat what, from the first, had already slipped away. In *Being and Time*, after having examined a constitutive feature of the being of *Dasein* (falling) and shown how, by 'persisting', man devotes himself to what is immediately accessible every day, to what is 'practical' and so finds himself cast adrift by virtue of his anxious agitation,⁵⁵ Heidegger was still able to appeal to a resolute conversion or better, to a resolute commitment to resoluteness, to the release of *Dasein* for its ownmost being in order that what thus remained in retreat, forgotten, should be brought to the light of presence. Such a step, directed toward a 'conversion', a transition from inauthenticity to authenticity based upon a strict correlation of *Erschlossenheit* and *Entschlossenheit*,⁵⁶ is thenceforward radically insufficient from the standpoint of rigorously thinking through the phenomenon of being as *Ausbleiben des Seins* – absence, the deficiency of being itself as being itself. While offering a commentary of Heraclitus' fragment 123, Heidegger deliberately emphasizes that 'it is not a matter of overcoming the κρύπτεσθαι of the φύσις and of getting rid of it'. The task is a different one, and 'much more difficult'. It consists in 'conferring upon the φύσις, in all the purity of its being, the κρύπτεσθαι which belongs to it'.⁵⁷

To respond to, without obfuscating, the withdrawal of being, which is being itself as secretive or enigmatic, this is the task which weighs upon any phenomenology for which the *Schritt zurück* constitutes the first step or, if you will, the ultimate metamorphosis of the reduction.

It is certainly tempting to interpret Heidegger's path of thinking as this procedure which, oriented from the very beginning toward the phenomenon of being, will lead from a phenomenology of *Dasein* to a resolutely aletheiological phenomenology, which will really be *aphanology* or, as Heidegger says himself a 'phenomenology of the non-apparent'.⁵⁸ However, in order that this expression should not remain a simple formula, it is necessary to show concretely how the mediation of the clearing, of the gift or of *Ereignis* remains authentically phenomenological, to show how the characterization of the phenomenological aspect of Greek thinking, as its fundamental aspect, does not presuppose an improper generalization of the concept or the pure and simple ambiguity of the concept.

Then, but only then, Heidegger's movement of thought can effectively appear as a *Weg in die Phänomenologie*.

Genetic phenomenology: towards a reconciliation of transcendental and ontological phenomenology

Christopher Macann

In his Introduction to *Being and Time*, Heidegger sought to establish the basic principles of a new phenomenology which would be ontological in character. In so doing, he distanced himself from his former master, Edmund Husserl, and from the kind of phenomenology which Husserl had already developed.

Nowhere is both the affinity with, and the contrast to, Husserlian phenomenology more explicitly expressed than in a passage in which Heidegger takes up the Husserlian slogan: To the things themselves! – and deploys it in a new way.¹ For the ‘things themselves’ concern both Husserlian and Heideggerian phenomenology in so far as *both* ways of doing phenomenology require that we first get back to things just as they present themselves with that *immediacy* which precludes pre-judice and pre-supposition. That Husserl arrives at ‘immediacy’ through an ultimate distancing (Reduction) whereas Heidegger tries to get there through a more primordial closing of the distance (Involvement) is no more important than the fact that, in one way or the other, they both seek to respond to the fundamental dictum – To the things themselves!

Phenomenology, Heidegger goes on to tell us, signifies primarily a *methodological conception*; that is, it concerns itself with the *how* rather than the *what* of philosophical research. Implied therein is the suggestion that the question *how* phenomenology accedes to the things themselves is by no means as unequivocal as Husserl might have thought, and that there might be another way of getting back to the things themselves. This other way is of course the way whose basic principles are set out in the two subsections devoted to the ‘Concept of the phenomenon’ and the ‘Concept of the *logos*’, from a combination of which Heidegger is able to arrive at his own ‘Preliminary conception of phenomenology’.

That such a latitude is being sought becomes clear from a passage at the very end of this critical section (7) devoted to ‘the phenomenological

method of investigation' where Heidegger re-evaluates the relation of possibility to actuality with specific reference to Husserl.

The following investigation would not have been possible if the ground had not been prepared by Edmund Husserl, with whose *Logische Untersuchungen* phenomenology first emerged. Our comments on the preliminary conception of phenomenology have shown that what is essential in it does not lie in its actuality as a philosophical movement. Higher than *actuality* stands *possibility*. We can understand phenomenology only by seizing upon it as possibility.²

When *Being and Time* was published, phenomenology was associated primarily, and almost exclusively, with the figure of Husserl who, in this sense, represented the *actuality* of phenomenology. In subordinating actuality to possibility Heidegger was not only claiming for himself the right to develop a *new* conception of phenomenology but also intimating that the phenomenological movement would only remain alive if such a re-conceiving of the nature, scope and objectives of phenomenology were constantly undertaken. What is important for philosophy, he reminds us in the Introduction to *Grundprobleme*, is not to know philosophy but to learn how to philosophize,³ which means keeping open at all times the primordial possibilities inherent in the *logos* of the *phenomenon*.

In this paper I propose to take Heidegger at his word. By first undertaking a careful examination of the sections of *Being and Time* in which Heidegger won his freedom from Husserlian phenomenology and claimed for himself the right to do phenomenology in a new way, I hope to find the basis for recommending yet another way of doing phenomenology, a way which, in particular, brings with it the advantage of reconciling and integrating transcendental and ontological phenomenology rather than leaving them standing as alternative, and competing, conceptions. I shall begin by following Heidegger's own differentiation of distinct concepts of the phenomenon but with a view to establishing an order of derivation between them. That is to say, not only will a basic and foundational concept of the phenomenon be established, a second and indeed a third concept will be recognized, as also an order of derivation accounting for the passage from the one to the other. I shall then use Heidegger's own analysis of the *logos* to locate different concepts of the *logos* corresponding to each of the concepts of the phenomenon which have already been differentiated, and also to reinforce the prevailing order of derivation.

This is the point at which my own programme will part company with that laid out by Heidegger. For, instead of systematically eliminating the secondary in favour of the primary, I shall recommend a re-evaluation of the secondary and, more important still, a recognition of the 'logic'

of the derivation of the secondary from the primary. In this way I shall arrive at a more Hegelian concept of phenomenology, one which traces the genesis of the different concepts of the phenomenon, each related and connected with its own appropriate concept of the *logos*. This logic of the derivation of secondary from primary concepts of the phenomenon will furnish the basis for a new way of doing phenomenology which might be called 'genetic phenomenology'. Finally, this 'genetic' phenomenology will be shown to be ontological in character.

A The preliminary exposition of phenomenology as the *logos* of the phenomenon

In the section (§7) devoted to the phenomenological method of investigation, Heidegger begins by splitting the expression into its two components in accordance with its Greek etymology. In subsection A, he deals with the 'Concept of the phenomenon', in subsection B with the 'Concept of the *logos*', bringing the two back together in the third subsection devoted to the 'Preliminary conception of phenomenology'. We shall follow this Heideggerian itinerary.

The term 'phenomenon', Heidegger tells us, is derived from the Greek where it signifies '*that which shows itself in itself*, the manifest'. Throughout what follows it is essential to bear in mind that, for Heidegger, this is the absolutely basic concept of the phenomenon upon which all the others are founded and to which they are consequently repeatedly traced back.

From this primary Greek concept of the *phenomenon* as that which shows itself in itself, Heidegger now moves on to the German concept *Schein*. *Schein* has two uses, a privative and general and a positive and specific. The privative use of *Schein* is introduced with a 'not', even though this negativity has later to be distinguished from that which characterizes the concept of *Erscheinung*. 'Indeed it is even possible for an entity to show itself as something which in itself it is *not*. . . . This kind of showing-itself is what we call seeming [*Scheinen*].'⁴ A little later Heidegger confirms the privative character of *Schein* when he says: 'We shall allot the term "phenomenon" to this positive and primordial signification of φαῖνόμενον, and distinguish "phenomenon" from "semblance", which is the privative modification of "phenomenon" as thus defined.'⁵ This privative concept of the phenomenon as 'semblance' is entirely general, in the sense that the privative character applies, in one way or another, to all the other concepts which will be derived from it, and in particular to that of the appearing – *Erscheinen*. However, there is another, quite specific connotation, which Heidegger has in mind when he talks of something 'looking like' (*sieht so aus wie*). This 'so . . . wie'

is also presented in terms of an 'as', as when he talks of something looking like but not in reality being that as which it gives itself out to be (*das so aussieht wie – aber 'in Wirklichkeit' das nicht ist, als was es sich gibt*). From his later discussion of the 'as' structure we know what Heidegger means here. He is talking about the *necessity* of things appearing 'as', whereby the semblant character of the appearing is meant not just that they may not appear in the same way to others or to the same person at some other time, but also, that the appearing is to be taken as an *immediate* apprehension of what manifests itself, just as and how it shows itself, without any critical reservations as to whether it might appear differently to others or under different circumstances and so might not really *be* the way it presently *appears*. For all that, Heidegger makes it quite clear that this privative concept of *Schein* is grounded in that of the phenomenon. 'When φαίνόμενον signifies "semblance", the primordial signification (the phenomenon as the manifest) is already included as that upon which the second signification is founded.'⁶

The concept of *Erscheinung* is, as such, a double derivative. First, that of which it is the derivative, namely the concept of *Schein*, is itself a privative modification of the fundamental concept of the phenomenon – as we have already seen. The sense in which *Erscheinung* is a derivative of *Schein* has still however to be determined. Etymologically, the derivation is apparent in the very structure of the concept, since *Er-scheinung* includes *Schein* as its root. Much more important, the concept of *Erscheinung* presupposes a difference between the appearing and what appears. What appears is, in one sense, the appearance but, in another sense, it is not. Heidegger uses terms like announce (*sich melden*), indicate, refer, etc., to characterize this difference. 'Thus appearance, as the appearing "of something" does not mean showing itself; it means rather announcing itself through something which does not show itself, but which announces itself through something which does show itself.' To emphasize the negative character of this difference, Heidegger continues: 'Appearing [*Erscheinen*] is a *not-showing-itself* [author's italics]', and moreover goes on to confirm that the '“not” we find here is by no means to be confused with the privative “not” which we used in defining the structure of semblance [*Schein*].'⁷ In other words, the concept of *Erscheinung* presupposes both a something and its appearance or appearing. And although it is by means of its appearance that the something appears, it itself does *not* appear. That through which, or by means of which, what appears makes its appearance does actually appear. The thing itself however does not appear but merely announces itself by way of something else which does appear.

It is important however to note that this difference between the appearance and the something of which it is the appearance does not run the lengths of an absolute disconnection. For it is in terms of just such a

conclusive disconnection that Heidegger then goes on to introduce a further and final concept of the appearance which he terms *bloße Erscheinung*. The difference between *Erscheinung* and *bloße Erscheinung* is brought out with reference to a difference between a something which *does not* appear and a something which *cannot* appear.

That which does the announcing – that which, in its showing itself, indicates something non-manifest – may be taken as that which emerges in what is itself non-manifest, and which emanates from it in such a way indeed that the non-manifest gets thought of as something that is essentially *never* [author's italics] manifest.⁸

Heidegger makes it clear that with this concept of 'mere appearance', he has Kant in mind. For in addition to using appearance in the first sense, Kant also uses the term appearance to talk of appearances as appearances of things in themselves which, as such, can *never* make their appearance.

In other words, this Kantian sense of the relation between appearance and thing in itself has to be distinguished from that inherent in any traditional substance theory such as that espoused by Locke or Descartes. To be sure, Kant further confuses the issue by also making use of the concept of 'substance', as the substrate underlying all appearances, as well as that of a 'transcendental object'. But in principle Heidegger is right in arguing that the ordinary use of *Erscheinung* deserves to be terminologically distinguished from that to which he gives the name 'mere appearance' (*bloße Erscheinung*). Indeed, he strengthens this distinction by talking about the 'mere appearance' as '“something brought forth” [*hervorgestellte*] but something which does not make up the real Being of what brings it forth',⁹ presumably because the noumenon is an intelligible entity (possibly also, and for this very reason, brought forth by a divine or creative intuition), whereas the phenomenon is strictly sensible.

What is noticeably missing in this critical review of the transcendental concept of 'mere appearance' is the Husserlian concept of the phenomenon. It is entirely characteristic of his strategy here that he fights his battle against transcendental philosophy on the Kantian terrain, rather than upon that occupied by his former master, Husserl. However, the omission of the Husserlian concept of the phenomenon conceals from view the extent to which Heidegger was actually pursuing a rather similar course, namely, the attempt to break through the historical legacy to a more primary conception of the phenomenon which would permit philosophy to get back to the things themselves. Thus, when Heidegger takes over the Husserlian slogan, he adds the explanation: 'It [the maxim] is opposed to all free-floating constructions and accidental findings; it is opposed to taking over any conceptions which only seem to have been

demonstrated.¹⁰ In order therefore to accommodate a Husserlian as well as a Kantian concept of *bloße Erscheinung*, it will be necessary to draw a distinction between '*bloße Erscheinung 1*' and '*bloße Erscheinung 2*'. The former will be taken to represent the Kantian, the latter, a Husserlian concept of 'mere appearance'.

Such a distinction is all the more necessary because, in a certain sense, a curious affinity prevails between the two, curious in the sense that one is almost obliged to talk of an affinity of opposites. What is common to the two is that the reality of the thing has become something purely ideal. The purely ideal character of the thing in itself means, for Kant, that it must be situated in a purely intelligible (i.e., noumenal) realm lying over and beyond that of the sensible (i.e., phenomenal). For Husserl, on the other hand, the ideality of the (transcendental) object means that it does, and can only, make its appearance in and through the phenomenal manifold as a *meaning* posited by intentional consciousness. Both Kant and Husserl subscribe to the unreality of the thing in itself. But whereas, for Kant, the noumenal unreality of the thing in itself is to be attributed to its ultimate *remoteness* from the human subject, for Husserl, the phenomenal unreality of the noematic object is to be attributed to the absolute *proximity* of that sphere within which alone it can appear, namely, the sphere of immanence. For Husserl, the thing itself cannot appear *not* because it is a something which exists over and beyond the realm of actual and possible appearances but because it is, in itself, nothing, a no-thing, the very opposite of anything thing-like, namely, an ideality or essence. Thus the Kantian 'noumenon', which is intrinsically *unknowable*, becomes the Husserlian 'noema', which is so constituted as to be intrinsically and pre-eminently *knowable*.

Sartre drew attention to the significance of this step when he opened his *Being and Nothingness* with the statement: 'Modern thought has realized considerable progress by reducing the existent to the series of appearances which manifest it.'¹¹ A little later, and in direct relation to an examination of the relation of appearance and essence, he says:

That is why we can equally well reject the dualism of appearance and essence. The appearance does not hide the essence, it reveals it; it is the essence. The essence of an existent is no longer a property sunk in the cavity of this existent; it is the manifest law which presides over the succession of its appearances, it is the principle of the series.¹²

Not only does Heidegger ignore this transformation of the status of the intelligible with respect to the sensible in the two principal exponents of that transcendental style of philosophizing for which appearance is reducible to 'mere appearance', it is significant that he presents the different concepts of the phenomenon laterally, that is, without really

showing how they are derived each from the other. In such a context, what is important is to fix terminologically the bounds of each concept so as to avoid confusion. 'If one designates these three different things as "appearance", bewilderment is unavoidable.'¹³ What is covered over in this perfectly reasonable request for terminological clarity is the possibility of effecting a derivation of the distinguishable concepts, one which might, in the end, lead to the specification of a 'logic' of the genesis of one from the other.

In his account of Heidegger's preliminary conception of phenomenology (see chap. 3, vol. I of the present work), Jean-François Courtine recognizes the absolutely fundamental character of the distinction between phenomenon and *Schein*. And he is well aware that the derivation of the concept of *Schein* sets in motion a series of further derivations: *Erscheinung*–*bloße Erscheinung*. But he then goes on to argue that

we can ignore here the supplementary distinction introduced by Heidegger with a view to elucidating the ambiguity of the German *Erscheinung* – in particular, the metaphysical distinction of *Erscheinung* (indicative phenomenon) and of *bloße Erscheinung* (mere appearance).¹⁴

But if the secondary is generated on the basis of the primary and the tertiary on the basis of the secondary, then surely this very order of derivation will attest to a logic of the genesis which must be of more than accidental significance since it accounts for that very covering over which calls for an uncovering? But the question is, whether anything can be done with the genesis which is thereby suggested.

Before we attempt to lay out a logic of the genesis of the several concepts of the phenomenon which Heidegger has already distinguished, it would be best to first take account of Heidegger's own attempt to furnish the *phenomenon* with a *logos*. Perhaps we shall find not only that to each concept of the *phenomenon* a corresponding concept of the *logos* can be assigned but that the ultimate *logos* will turn out to be a *logic* of the genesis of the secondary from the primary – logic in the Hegelian sense of a necessary order of derivation.

Subsection B of ¶7 is concerned to offer a concept of the *logos* which will fit together with that of the phenomenon. Heidegger's main concern is to resist the temptation to effect an immediate translation of the *logos* into the realm of language, truth and logic, whereby it gets assimilated into epistemology. At the same time, the new concept of the *logos*, a concept which, according to Heidegger, is only a revival of the original Greek concept, must conceive of the *logos* in such a way that it is

susceptible to being brought into the realm of discourse. '*Logos* as "discourse" means rather the same as *δηλοῦν*: to make manifest what one is "talking about" in one's discourse.'¹⁵ This double intention, freeing the *logos* from theories of judgment on the one hand, and freeing it for its expression in discourse, on the other is, at the same time, designed to open up a concept of the *logos* which will fit together with that of the phenomenon, so that phenomenology can effectively be the 'logic' of the 'phenomenon'.

Heidegger proceeds about his business in two steps. First he suggests that the *logos* 'lets something be seen'. The use of a visual terminology to express the intelligibility of what is thereby apprehended attests to the residual, but still powerful, influence of Husserl and his 'eidetic vision'. Letting-be-seen is here clearly both differentiated from and connected to the self-showing characteristic of the *phenomenon*. What lets itself be seen is, and can only be, what shows itself. The supplement of meaning inherent in 'letting be seen' is then brought out through the notion of 'seeing as'. 'Here the *σύν* has a purely apophantical signification and means letting something be seen in its *togetherness* with something – letting it be seen *as* something.'¹⁶ Only in so far as the *logos* has the character of synthesis can a question of truth arise with regard to what lets itself be seen. 'Being false amounts to deceiving in the sense of covering up: putting something in front of something and thereby passing it off as something which it is not.'¹⁷

Subsection C of ¶7 puts subsections A and B together in a formulation which articulates the connection of *phenomenon* and *logos* – phenomenology. 'Thus "phenomenology" means ἀποφαίνεσθαι τὰ φαινόμενα – to let that which shows itself be seen from itself in the very way in which it shows itself from itself.'¹⁸ The self-manifestation characteristic of the concept of the 'phenomenon' is put together with the letting-be-seen which defines Heidegger's use of the term '*logos*' and in such a way that the combination is fit for expression in a discourse which makes manifest what one is talking about. In place of any correspondence theory of truth, we have a letting be seen of what shows itself which finds expression in a discourse which communicates.

But the aim of subsection C is by no means confined to simply putting the *logos* and the *phenomenon* back into relation with each other. There is a much more important objective in view, namely, to conceive of the phenomenology which results in a manner sharply contrasted with that of Husserl's own phenomenology. Heidegger brings his new conception into focus through a notion of covering up, a notion which functions as the complement of that of the *phenomenon*. Bringing to light, uncovering, always implies the possibility of covering up. What gets covered up in the kind of regional ontology undertaken by Husserl in the name

of phenomenology is precisely the being of those entities whose prior demarcation (into distinct regions) serves as the point of departure for Husserl's own phenomenological analyses.

Thus Heidegger shifts the frame of reference of phenomenological philosophy in an ontological direction. While conceding that phenomenology, as a method, remains the way of access to the theme, he insists that the theme itself is being. Hence phenomenology is given out as being 'the science of the Being of entities – ontology'.¹⁹ The investigation of being in general is the science of ontology. But a further question arises with regard to the proper mode of access to being in general, a question which has in fact already been answered in the first part of the Introduction where Heidegger asks: 'Is the starting-point optional, or does some particular entity have priority when we come to work out the question of Being?'²⁰ So we already know the answer. Dasein is that being whose being must be interrogated first with regard to obtaining the proper mode of access to being and precisely because an understanding of being (of however indefinite a kind) already belongs to Dasein's own self-understanding.

So whenever an ontology takes for its theme entities whose character of Being is other than that of Dasein, it has its foundation and motivation in Dasein's own ontical structure, in which a pre-ontological understanding of Being is comprised as a definite characteristic.²¹

From this acceptance of a Dasein's analytic as the correct mode of access to an understanding of being, Heidegger generates his own quite distinctive conception of phenomenology. First, the *ontological* implications of a Dasein's analytic are drawn. 'With regard to its subject-matter, phenomenology is the science of the Being of entities – ontology.'²² Second, the *hermeneutical* implications of a phenomenology of Dasein are drawn. 'Our investigation itself will show that the meaning of phenomenological description as a method lies in interpretation.'²³ Finally, the *existential* implications are confirmed.

And finally, to the extent that Dasein, as an entity with the possibility of existence, has ontological priority over every other entity, 'hermeneutic', as an interpretation of Dasein's Being, has the third and specific sense of an analytic of the existentiality of existence.²⁴

From all of the above Heidegger draws the general conclusion that 'philosophy is universal phenomenological ontology and takes its departure from the hermeneutic of Dasein, which, as an analytic of *existence*, has made fast the guiding-line for all philosophical inquiry at the point where it *arises* and to which it *returns*'.²⁵

B The genetic re-construction of phenomenology as the *logos* of the phenomenon

Let us retrace our steps with a view to taking account of what has been established. The key to an understanding of the new possibility opened up by Heidegger lies in the disclosure of different concepts of appearance. Heidegger begins with a (Greek) concept of the phenomenon broad enough to cover all the various ways in which being manifests itself – i.e., shows itself from itself. These alternative ways are then reduced to three (*Schein* – *Erscheinung* – *bloße Erscheinung*). The question is whether an order of derivation can be established between them and, moreover, what can be achieved by establishing just such an order of derivation.

We have already given reasons for thinking that such an order of derivation can be established. *Schein* stands for the immediate apprehension of whatever is encountered, just as it gives itself, and without any critical reservations as to whether or not it might be in itself as it appears. There is no being beyond, or behind, the appearing. Being is its appearing and nothing more. The term *Erscheinung* begins the work of critical inquiry. In order to allow for the possibility of the thing being other than it appears to be, a difference has to be presupposed between the thing itself and its appearance. Thus the term appearance contains a reference to something other than itself of which the appearance is an appearance. A step back has been accomplished with a view to determining whether or not things are as they appear to be or, in other words, with a view to permitting a theory of knowledge to be constructed on the basis of the epistemologically more relevant concept of *Erscheinung*. The further step back represented by the term *bloße Erscheinung* is one which is illustrated in very different, indeed opposite, ways by the transcendental philosophies of Kant and Husserl. On the one hand, *things in themselves* are expelled into a realm of the imperceptible, lying beyond appearances. On the other hand, *things themselves* are resolved into a succession of mere appearances which is itself then unified and connected through the notion of a noematic object.

In the light of the re-orientation of phenomenology in an ontological direction, our next step must be to bring out the connection between the concept of *Schein* (as one of three modes of appearing) and the specific mode of appearing relevant to ontological phenomenology. After that, we shall have to undertake a deeper investigation of the grounding procedure with reference to the concept of the *logos* and with a view to clearing the way for a genetic re-construction of ontological phenomenology as the *logos* of the *phenomenon*.

The first sentences of subsection A of ¶7 make the connection between *Schein* and *Phenomenon* quite clear. Heidegger goes back to the Greek

to point out that not only does the word *phenomenon* have the significance 'that which shows itself', but that it also has the signification of 'semblance' or 'seeming'. 'Thus in Greek too the expression φαίνόμενον "phenomenon" signifies that which looks like something, that which is "semblant", "semblance" [das "Scheinbare" . . . der "Schein"]'.²⁶ Further, when he goes into the structural interconnection of these two concepts, he makes it clear that the second is founded in the first.

Only when the meaning of something is such that it makes pretension of showing itself – that is, of being a phenomenon – can it show itself as something which it is not; only then can it 'merely look like so-and-so'. When φαίνόμενον signifies 'semblance', the primordial signification (the phenomenon as the manifest) is already included as that upon which the second signification is founded.²⁷

Thus the concept of semblance is presented as the 'privative modification' of the more original concept of the 'phenomenon'.

Relative to the concept of the phenomenon, that of *Schein* is derivative, and this is the reason why it is described as a privative modification. But there are more than enough clues to indicate the ontological character of *Schein*. Heidegger tells us that 'an entity can show itself in many ways, depending in each case on the kind of access [*Zugangsart*] we have to it'.²⁸ This kind of access is indicative of the perspectival and circumstantial character of any encounter with things. Entities show themselves and must show themselves from themselves in order for it to be possible for us to have access to them. Our access 'to' is however a partial and limited apprehension of what manifests itself. Ontologically speaking, it is secondary, though for us, it is primary. Further, the 'looking like' of semblance is described in terms of a 'so-wie' or an 'als was'. From the descriptions to be found later in *Being and Time* (especially ¶32), as also in his lectures on *Logik* (especially ¶12), we know that these structures are employed to characterize Dasein's circumspective involvement with things in the context of a world. Even the privative and, one might almost say, negative characterization of *Schein* – the showing itself 'as something which in itself it is not' – confirms the *ontological* status of *Schein*. For in this privative or negative characterization we find the origin of the mutually determining ambivalence 'revealing-concealing', an ambivalence which is basic to the ontological character of disclosure.

The relation of foundation is with Heidegger always so conceived that the derivative is ontologically less significant than the primary and indeed effects a concealment of the primary sense of the concept. This means that the transition first to *Erscheinung* and then to *bloße Erscheinung* is to be understood as a movement away from the domain of the ontologically primordial and in the direction of the ontically derivative. The Hegelian

presentation of the relative place of the concepts *Schein* and *Erscheinung* in the *Logic* should also be borne in mind here. For, in the *Logic*, *Schein* is the term used in so far as Being manifests itself in an immediate and unreflected manner. *Erscheinung* takes the place of *Schein* in the course of the transition from the doctrine of Being to the doctrine of the Essence. For the Essence is the mediated reflection of Being in and through itself.

It is time now to look a little more closely into the procedure of derivation. This can most effectively be done with reference to the concept of the *logos*, not merely in later sections of *Being and Time* but also in other texts, especially volume 21 of the *Gesamtausgabe*, entitled *Logik*.

It is possible to distinguish four main approaches to the ontological significance of the *logos* in Heidegger's first philosophy. Most of these approaches are themselves divisible into substrategies of one kind or another. And at times the borderlines between the approaches are difficult to sustain. However, for the purposes of our analysis, we shall distinguish the approach by way of the problematic of *meaning*, of *truth*, of *language* and of *being*. There is a sense in which these four problematics are themselves laid out in an order of derivation (or, conversely, of primordially), with this main exception, that the approach by way of the problematic of being is sometimes treated as the last result of the procedure of analytical derivation, at other times, as the first condition. There is no inconsistency here. For, as the first condition in the order of being, it is always presupposed by any ontological analysis of meaning truth or language even though, in the order of analysis, it is often treated last.

Characteristically, Heidegger's interpretative procedure combines a regressive with a progressive analysis. The analysis starts out upon that plane which is more readily accessible precisely because it is not genuinely primordial. It then inquires back into the grounding conditions. Once these conditions have been disclosed, the direction of the analysis is reversed with a view to accounting for the derivation of the secondary from the primary. This characteristic method is clearly stated in a passage from *Being and Time* immediately preceding Heidegger's investigation of truth and its ontological foundations.

Our analysis takes its departure from the traditional conception of truth, and attempts to lay bare the ontological foundations of that conception (a). In terms of these foundations the primordial phenomenon of truth becomes visible. We can then exhibit the way in which the traditional conception of truth has been derived from this phenomenon (b). Our investigation will make it plain that to the question of

the 'essence' of truth, there belongs necessarily the question of the kind of Being which truth possesses (c).²⁹

At the level of an ontological analysis of *meaning*, the so-called 'As-structure' is by far the most important element, though there are other elements to be taken into consideration, for example, the existential structures and the question of validity. The analysis of the 'As-structure' is most fully carried out in ¶32, where it leads on into a discussion of meaning. Heidegger first establishes the connection between understanding and interpretation. In the first instance, interpretation is presented in its most basic form as existential projection which interprets the world in terms of possibilities of being. Only later does Heidegger move on to the issue of textual interpretation, though even in this most basic understanding of interpretation Heidegger does have the latter at the back of his mind, as when he insists:

If, when one is engaged in a particular concrete kind of interpretation, in the sense of exact textual interpretation, one likes to appeal to what 'stands there', then one finds that what 'stands there' in the first instance is nothing other than the obvious undiscussed assumption.³⁰

Heidegger makes the move to a disclosure of the As-structure via a preliminary reference back to the concept of the ready-to-hand. The involvement character of the ready-to-hand is now brought explicitly into view as an 'in order to' which lets something be disclosed *as* something. 'That which has been circumspectively taken apart with regard to its "in-order-to", and taken apart as such – that which is *explicitly* understood – has the structure of *something as something*.'³¹ All instrumental dealing-with presupposes a prior understanding of what a thing is for and the laying out of this understanding is precisely the making explicit of its being *as*, or, in other words, its 'As-structure'. Understanding something 'as' is then further grounded in the triple structure of a fore-having, a fore-sight and a fore-conception. Clearly, this triple fore-structure is arranged in an order of primordially, somewhat in the manner of Kant's triple synthesis which is so ordered as to yield an analysis both from above and from below. But even the highest level, which bears upon the conceptualization of interpretation, is pre-predicative in the sense that it involves a conceiving in advance which is, moreover, not to be interpreted as an 'a priori'.

From the articulation of the fore-structures, the analysis moves on to the theme of meaning. Implied in this analysis is both a positive laying out of the meaning of meaning and a negative critique of current conceptions of meaning. 'Meaning is the "upon-which" of a projection in terms of which something becomes intelligible as something; it gets its structure

from a fore-having, a fore-sight, and a fore-conception.³² From this it follows that meaning is an existential structure of Dasein, not a property of things. Only in so far as Dasein *is* can there be meaning, and not merely the meaningfulness of Dasein but also that of entities whose mode of being is not that of Dasein. Again, when the meaning of entities other than Dasein is in question, this meaning cannot be understood as the superimposition of meaning upon a meaning-free apprehension of the entity. There is no such thing as an as-free simply seeing³³ or a presuppositionless apprehension of something.³⁴ Indeed, Heidegger warns us that

when we merely stare at something, our just-having-it-before-us lies before us as a failure to understand it any more. This grasping which is free of the 'as' is a privation of the kind of seeing in which one *merely* understands.³⁵

And here we find ourselves right away on the terrain of the derivation of the secondary from the primary. However, rather than pursuing this theme on the plane of meaning (where it is only provisionally hinted at), we shall leave it to the plane of truth and language where it is much more extensively developed.

The very title of ¶33 ('Assertion as a derivative mode of interpretation') indicates that the regressive analysis is undergoing a reversal. The first sentences of ¶33 confirm the derivative character of Assertion. Interpretation is grounded in and derived from Understanding. What is articulated in interpretation and understood in advance as articulateable is meaning. Assertion is meaningful in so far as it too is grounded in and derived from Interpretation.³⁶ In turn, assertion, which Heidegger explicitly connects with judgment (*Urteil*) and therefore with truth (assertion as the primary locus of truth) sets in motion its own process of derivation. Indeed, the three structures in terms of which Heidegger actually analyses assertion (pointing out, predication and communication) are themselves indicative of just such a procedure of derivation.

The formula of the *Logik* is slightly different from that of *Being and Time*. In the *Logik*, Heidegger distinguishes (1) Pointing out (*Aufzeigen*), (2) Determination (*Bestimmung*) and (3) Communication (*Mitteilung*).³⁷ In *Being and Time*, it is Pointing out, Predication and Communication.³⁸ The difference here is however only nominal since Heidegger takes predication to be the condition for determination. A second difference in the mode of presentation is however worth noting. As befits a treatise on *Logik*, Heidegger connects the Greek concept of the *logos* more explicitly with the primary phenomenon of meaning and truth, and thereby places greater emphasis upon the procedure of derivation. For example, a great part of the material which, in *Being and Time*, is

distributed around Interpretation and Assertion is grouped, in the *Logik*, around two sections which deal with the difference between a primary, hermeneutical 'as' and a secondary apophantical 'as'. Moreover, since the *Logik* is primarily and almost exclusively devoted to 'the question concerning Truth', the regressive movement also has to operate at the level of language, and indeed moves back from the conventional acceptance of the statement as the locus of truth and the definition of truth as correspondence, back to a more primordial disclosure through which the 'As-structure' is brought to light.

To return to *Being and Time*; first, assertion is taken to signify 'pointing out' (*Aufzeigen*). It is no accident that the same root concept (*zeigen*) is employed here as was initially employed to characterize the *phenomenon*, with this critical difference, that in place of a self showing (*sich zeigen*), a showing itself from itself of being, we now have a showing which is a pointing out (*Aufzeigen*) of being. The primordial character of this pointing out is confirmed with a reference to the ready-to-hand way of understanding.

Second, assertion is characterized as predication. Heidegger talks of two senses of predication. The first and most primordial signification of predication lies in the pointing out of a unitary phenomenon – the being too heavy of the hammer. Here the emphasis is on its unserviceability as being too heavy. In the second sense of predication, there is not only a splitting of subject from predicate but the focus of attention undergoes a restriction (*Einschränkung*) to the hammer as such, and in such a way that the weight of the hammer can now figure as just one among many other possible predicates which, between them, give the hammer a determinate character. In the *Logik*, Heidegger employs the term 'concentrate' (*konzentriert*) in place of 'restrict' to characterize the way in which the focus of attention gets diverted to the thing itself as simply present at hand with certain determinations. Again, in the *Logik*, Heidegger talks extensively of a levelling down process (*nivelliert sich das primär verstehende 'als'*),³⁹ a terminology which he reserves in *Being and Time* for other phenomena, for example, the emergence of *das Man*. In place of the language of 'levelling down', Heidegger talks in *Being and Time* of a 'step back' or of a 'dimming down'.

Finally, assertion is characterized as communication (*Mitteilung*). Communication brings with it a whole series of derivations. As if to confirm the derivative character of communication, Heidegger brings back the three fore-structures in order to show just what kind of a modification each of them undergoes. At the level of fore-having (*vor-habe*), the 'with which' (*womit* – in the *Logik*, *wozu*) of the ready-to-hand turns into an 'about which' (*worüber*).⁴⁰ At the level of fore-sight (*vor-sicht*), the hermeneutical 'as' of ready-to-hand involvement gets turned into an apophantical 'as' of properties present-at-hand. At the level of fore-

conception (*vor-griff*), the appropriative 'as' of understanding no longer reaches into a totality of relations but gets levelled down to a simply seeing what is present-at-hand. But the procedure of derivation inherent in the fore-structures is only the preliminary to a more widespread derivation which leads on to discourse (*Rede*) and eventually to idle talk (*Gerede*). What is expressed in an original articulation of what has been seen gets communicated. And this communication of an understanding first developed in a context of actual seeing then gets retold outside of such a context and eventually becomes mere hearsay. In addition to this line of degeneration which leads into the inauthentic understanding of *das Man*, there is also the degeneration that follows upon the present-at-hand way of understanding language itself, language as the being at hand of a multiplicity of words, the binding and separating of language (synthesis and diaeresis) trivialized down to the synthesis and analysis of predicative judgment and eventually formalized into the purely relational structure of conceptual combination in a logical calculus.

The above analysis is taken up again in ¶44. Indeed, so conscious is Heidegger of the possible charge of repetitiousness that he calls his earlier presentation a 'dogmatic Interpretation'. However, the difference lies less in a distinction between a phenomenological and a dogmatic interpretation but elsewhere. The first analysis was conducted in the context of the structure of being-in, the most primordial of the three structures into which the overall structure of being-in-the-world is subdivided but one which still falls short of the more radical primordiality which Heidegger has in mind with the concept of 'care', a concept through which Heidegger hopes to bring the primordial totality of Dasein's being-in-the-world back into view as a structural whole. This structural need for a repetition is complemented by a change in emphasis from the *logos* as the locus of *meaning* to the *logos* as the locus of *truth*.

Heidegger begins his investigation here (¶44(a)), as he does in the *Logik*,⁴¹ with a statement of three theses which, he says, belong to the traditional conception of truth and which turn out in the end to be presuppositions without foundation: (1) That the locus of truth is assertion (judgment); (2) that the essence of truth lies in the agreement of the judgment with its object; (3) that Aristotle, the father of logic, was responsible for setting up both these misconceptions. The focus of his analysis turns on the second of these three theses and consists in an attempt to explain how the notion of truth as correspondence got set up in the first place. The method employed consists in a preliminary regressive inquiry into the ground of what is initially and naively taken for granted, followed by a progressive inquiry which accounts for the derivation of the secondary from the primary.

The regressive inquiry goes through two main steps. First, the ontological investigation of truth is stated to be one which rests on being-

uncovering. 'The *Being-true* of the assertion must be understood as *Being-uncovering*.'⁴² Or again a little later: 'The most primordial phenomenon of truth is first shown by the existential-ontological foundations of uncovering.'⁴³ Being-uncovering is itself also differentiated into a more primary and a more secondary mode. What is primarily true as uncovering is Dasein as uncovering (*Entdeckend-sein*). What is only secondarily true is what is thereby uncovered (*Entdeckt-sein*). Second, Being-uncovering is then shown to be grounded in the world's disclosiveness. Moreover, we are reminded that disclosedness is that basic character of Dasein according to which it is its 'there'.

The disclosure of disclosedness as a basic state of Being of Dasein in turn prepares the way for a progressive enquiry into the derivation of the secondary from the primary. For since Falling, along with thrownness and projection, also belongs to Dasein's state of Being, what is first in the ontological order gets covered up and becomes the last to be uncovered in the order of analysis, whereas what is last in the ontological order gets discovered as the first and most obvious 'truth' in the ontic order. However, though Falling is the existential structure which accounts for the derivation, the focus of the account now falls on the phenomenon of Discourse. For Discourse not only expresses the truth of disclosure in an original uncovering of inner-worldly entities, it also preserves the truth and so makes it readily available for utilization, even in contexts where no such disclosive uncovering actually takes place. Thus, the ready-to-hand utilization of Discourse as a being toward the truth becomes a present-at-hand conception of the truth, and this in a number of steps.

First, what was originally uncovered in a Being-toward inner-worldly entities now gets understood as something merely present-at-hand. Assertion, as expressed in Discourse, is still a pointing out which uncovers, but what is uncovered has a tendency to perpetuate itself as simply being what it is. Then, and as a result of the foregoing, the Discourse through which such an uncovering takes place gets understood as something merely present-at-hand. This analysis is one which Heidegger had already taken account of earlier and so is not repeated here. Finally, the relation between Discourse (now understood as judgment and as the locus of truth) and the world itself gets understood as something merely present-at-hand. Thus the correspondence theory of truth arises on the basis of a present-at-hand conception of the relation between language (as present-at-hand) and the world (as present-at-hand).

C Genetic phenomenology as ontology

Our investigation of the concept of the phenomenon led to the discovery of three distinct (German) concepts of appearance, each of which is grounded in, and traceable back to, a primary (Greek) concept of the phenomenon. The subsequent investigation of the concept of the *logos* served to confirm the presence of a corresponding procedure of derivation designed to show how the primary gets converted into the secondary and in such a way that the ontological import of the original root meaning of the concept is lost. In the context of Heidegger's archaeological investigation, the aim of the analysis is to recommend a regression to the ontological ground, a regression which at the same time would disqualify any derivative notion. Our intention is quite different, to let the derivative notions stand out in their own right with a view to disclosing a logic of the genesis of one from the other. More particularly, this method has the advantage that it enables us to retain the Husserlian conception of phenomenology rather than requiring of us that we discard such a conception in favour of the Heideggerian. But in order that the Husserlian as well as the Heideggerian conception of phenomenology be acknowledged, it will also be necessary to accord a phenomenological significance to the epistemological concept of *Erscheinung*, together with whatever concept of the *logos* belongs to it.

Our task in this final section will therefore be as follows: we shall establish a connection between each concept of the *phenomenon* and that concept of the *logos* which might be said to belong to it. In so doing we shall, at the same time, confirm the need for a new conception of phenomenology with its own quite distinctive, 'genetic' logic, a conception of phenomenology which conceives of the latter essentially in terms of a logic of the genesis of one concept of the *phenomenon* (together with its own specific concept of the *logos*) from another.

Throughout what follows however, it should be borne in mind that the original (Greek) concept of the 'phenomenon' is not merely the most basic concept of appearance but, as such, one which lies at the root of all the other derivative concepts. The *logos* of this most fundamental (Greek) concept of the *phenomenon* may be said to lie in the disclosedness of being in general. But any determination of the meaning of being necessarily rests upon its appearing. To the several ways in which being *does* manifest itself, there therefore correspond so many ways in which the *logos* of the *phenomenon* can be determined.

The concept of the *phenomenon* which belongs to the first and most primordial stage is obviously that of *Schein*. Semblance is the appearing of being in its original immediacy, that is, in such a way that, inherent in the revealing characteristic of such a mode of appearing, there lurks a concealing. The privative aspect comes to prominence in the concept

of 'semblance' or mere seeming, though, once again, it is necessary to insist that without such 'mere seeming' there could not be an appearing which could ever later be subject to the relevant criteria of validity. We may say that, for Heidegger, the *logos* of such an ontological concept of appearance, *qua Schein*, lies in uncovering or dis-closure. Precisely because disclosure is not disconnected from the appearing of being but is, on the contrary, intimately connected with the latter, this Heideggerian concept of the *logos* gets close to the original Greek notion of the *logos* as the unity of thinking and being.

Grounded in this ontological concept of the *phenomenon* (together with the concept of the *logos* appropriate to it), and derived from it, we find a quite different concept of the *phenomenon*. Only in so far as a distinction is drawn between the *phenomenon*, as it appears, and that of which it is the appearance does it become possible to talk of the *truth* of the *phenomenon* in a sense relevant to epistemology. Such a derivative notion of truth is, of course, that enshrined in the theory of adequation, which itself presupposes a radical distinction between two kinds of truth, the synthetic and the analytic. One might say that the differentiation of substance from appearance, on the side of being, is reproduced, on the side of language, by a distinction between two kinds of validation, one which does require a reference to a corresponding reality (synthetic truth) and another which requires no such reference (analytic truth). The *logos* here assumes the form of the conventional epistemological concept of truth. In conformity therewith we might also add that the *telos* of such a *logos* is to be found in formal logic. It is in this sense that Kant talked of the principle of non-contradiction as the 'highest principle of all analytic judgments' – whereby he also insisted that synthetic judgments must also conform to this condition as a necessary (though by no means sufficient) condition of their being true.

Finally, we find a third concept of appearance, that namely of *bloße Erscheinung* and, in conformity therewith, a transcendental concept of the *logos*. With Kant, such a transcendental concept of the *logos* finds its foundation in a priori *synthetic* judgments and the knowledge that can be derived from them; with Husserl, in an investigation of the a priori *structures* of a transcendentially reduced consciousness. It is however critical to our use of the concept of *bloße Erscheinung* that we should have chosen to follow the course marked out by Husserl rather than Kant, a course clearly and explicitly laid out in such texts as *Ideas I* or *Formal and Transcendental Logic*. Here, we might say, the *telos* of the *logos* is transcendental logic.

With this threefold connection of the concept of the *phenomenon* with its own appropriate concept of the *logos* our genetic conception of phenomenology is, strictly speaking, completed. To be sure, this threefold derivation of the concept of the *phenomenon* together with its

corresponding concept of the *logos* is only the most summary sketch of a theory, but one whose inspiration can readily be traced back to Heidegger's own analyses, no matter how far its conclusions may stray from those which Heidegger himself wished to draw.

Rather than leaving things in this provisional state, it is, I think, worth taking one further step, a step which will take us in the direction of yet another concept of the *logos*, the *logos* as the logic of the genesis of the several conceptions of 'phenomenology' which have just been distinguished. The model for such a final concept of the *logos* is, of course, that offered by Hegel in his *Logic*. Critical to such a new 'genetic' phenomenology is not merely the recognition of a procedure of derivation (that we find already in Heidegger) but the re-evaluation of what, with Heidegger, is dismissed as derivative. That Heidegger is able to carry through such a strategy of dismissal is largely due to the fact that, effectively, he recognizes only two stages, the ontological and the ontic, which latter can be dismissed as being of little or no phenomenological significance. Hence the importance of accommodating the third concept of *bloße Erscheinung* primarily, and almost exclusively, with reference to Kant. As soon however as the transcendental concept of the phenomenon is widened to include Husserl, it becomes apparent that the devaluation of the derivative implies a rejection of Husserl's transcendental philosophy as *phenomenology*, a rejection which, if it had ever been explicitly articulated by Heidegger, would immediately have invited vociferous objection.

Genetic phenomenology of the kind outlined in this paper is *teleological* rather than *archaeological* in character. That is, it proceeds forward *from* the ground rather than backward *to* the ground. The dependence of such a teleological genesis upon a prior archaeological genesis is however clear. It is only possible to proceed from the ground if the ground has first been disclosed as such. However, it is important to appreciate that there are two ways back to the ground, one (the Heideggerian way) which follows what might be called a 'direct regression' from the ontic back to the ground and another, 'indirect regression' which passes by way of a transcendental investigation. It is critical to the concept of a genetic phenomenology which has been sketched out here that any such 'direct regression' should be replaced by a 'reflective detour'. Both in my study of Kant⁴⁴ and my study of Husserl⁴⁵ as well as in my ontological philosophy, *Being and Becoming*,⁴⁶ I have employed the concept of an 'ontological transposition' to allow for a movement of return to the origin which takes in rather than excluding transcendental philosophy. Indeed, I would even go so far as to suggest that implicitly, if not explicitly, Heidegger has himself adopted this very route and that, in consequence, Heidegger's first philosophy may be envisaged as

'radicalized phenomenology', in the quite specific sense in which Tugendhat deploys that phrase (see chap. 36, vol. III of the present work).

In the light of such an alternative conception of the movement of return it also becomes necessary to confer a phenomenological status upon epistemology. To bring to light the phenomenological status of epistemology is to recognize that the opposition which lies at the root of the epistemological conception of reality, the opposition of knowledge and its object, of words and things or, to use the older formulation, of subject and object, is not a *given* opposition but one which is brought into being by human being itself. To be sure, from within the intellectual configuration established by epistemology, the phenomenological character of epistemology is by no means apparent, so little so that the conception of truth with which epistemology operates (adequation or, as it is called, the 'correspondence' theory) is simply taken for granted – as Heidegger has shown. That epistemology may not recognize its dependence upon a specific concept of the *phenomenon* and, in accordance therewith, a correspondingly specific concept of the *logos*, only confirms what appears to be in question. The non-original is precisely that which is most readily taken for granted and so handed down as an incontrovertible acquisition.

The advantages of such a genetic conception of phenomenology are obvious. First, the essential insights embodied in Heidegger's own ontological conception of phenomenology can be preserved. They form, so to speak, the original *ground* for the entire genesis and, as such, the conclusive *goal* in which the genesis culminates. Second, it becomes possible to accord a phenomenological significance to epistemology (especially in its contemporary 'positivist' mode) and to the objectified world view with which it operates. It is indeed strange that at a time when analytical epistemology is coming to assume a dominant role in philosophy, and indeed threatens to usurp the entire terrain of philosophy, phenomenological philosophy should persist in dismissing what Husserl called 'the world of the natural attitude' as a *merely* ontic affair. Ordinary language, which is the language of what Heidegger called 'average everydayness', may not present us with any very extraordinary philosophical insights. But it has its part to play in the construction and preservation of that *familiar* world view which lies at the root of most of our practical and theoretical activities – as Wittgenstein has shown at great length and in the finest detail. More seriously still, any attempt to dismiss (formal) logical analysis as a product of the technocratic spirit and as a sign of the dissolution of all relations into relations of calculation and manipulation will simply hasten that philosophical demise which has already been anticipated by Heidegger and so contribute to, rather than call in question, the universal sway of technology. If logic, in the formal sense, is the 'enemy', it is an enemy which cannot be wished away but

one which, if it is to be restrained, will have to be subjected to the most strenuous, *critical* examination of the kind attempted by Husserl. In fact, Husserl has already shown in what sense formal thought rests in an essential dependence upon phenomenology, rather than the other way around; and I can see no reason why a similar kind of dependence cannot be brought to light from a more specifically ontological standpoint. Finally, and this seems to me to be decisive, rather than having to opt for *either* the Husserlian *or* the Heideggerian version of phenomenology, a genetic conception of phenomenology makes it possible to integrate them *both* within one overall framework that traces the self-manifestation of being and truth through its constitutive stages.

We know that it is one of the signal contributions of Heidegger's thinking about being that he should have brought the question of truth back into connection with the question of being and so have furnished the basis for what might be called an *ontological* concept of truth. In the last analysis however, it seems more reasonable to suppose, with Hegel, that truth is not to be located in any *given* concept of the truth, whether epistemological, transcendental or ontological (in the Heideggerian sense) but rather in the process whereby being becomes the medium in which the self-unfolding of truth occurs – genetic phenomenology. Moreover, if being *is* its appearing, and if therefore the specification of the several ways in which the logic of the phenomenon can be determined is nothing other than phenomenology, in its most fundamental and final sense, then there can be no essential difference between ontology and phenomenology. The logic of the self-manifestation of being is phenomenology, as ontology. To borrow, and then to invert, but without intending to subvert, a well-known phrase from Heidegger: *only as ontology* (and moreover as 'genetic' ontology), *is phenomenology possible*.

46 *Being and Becoming* is as yet unpublished and indeed, as it stands, is incomplete. It is divided into four parts, a first part devoted to a genetic theory of consciousness, a second part devoted to natural philosophy (time/space/causality), a third part devoted to social philosophy (intersubjectivity/language/culture) and a fourth part devoted to practical philosophy (freedom/ethics/politics). Of this complete programme, Part 1, two sections of Part 2 (time/space), one section of Part 3 (intersubjectivity) and one section of Part 4 (freedom) are finished.

Heidegger's conception of space

Maria Villela-Petit

Space and the incomplete character of *Being and Time*

How is one to interpret the incomplete character of *Being and Time*, the absence of this third section which should have been called 'Zeit und Sein', given the further development of the Heideggerian work? Should we not ask ourselves what this incompleteness was implicitly bound up with? Was it simply, as appears at first sight, bound up with the question of being and of time, which *Sein und Zeit* seeks to connect in one single question? And what if this incompleteness also had to do with the third term that the dyad *being* and *time* had, in a certain manner, obscured, namely space and, in particular, the respective relations of space and time in the economy of *Sein und Zeit*?

An interrogation of this kind does not proceed solely from my interest in the question of space; it is also suggested by some remarks which Heidegger himself makes in the text of the lecture 'Zeit und Sein' (1968),¹ a lecture which adopted, let us not forget, the very title intended for the third section of *Sein und Zeit*, that which, precisely, had never been brought to completion.

The reading of this lecture calls for two acknowledgements. The first is that Heidegger names space and time together by employing the nomenclature *Zeit-Raum*. This titular procedure (whereby time and space are brought together through a common characteristic) is not to be understood as a tribute paid to relativist science. Rather, it signals, on the one hand, the inappropriateness of the propositional structure of language and, on the other, the incapacity of any physical theory to express what has to be thought here, namely, the deployment, the truth of being apprehended on the basis of the experience of what Heidegger calls *Ereignis*. But we are getting ahead of ourselves. For the moment, let us simply note that, by way of such a nomenclature, Heidegger

undoubtedly wanted to warn us against any attempt (including his own earlier attempt) to effect a transcendental appropriation of space by time or, in opposition to the former, and in the Hegelian manner, to attempt a sort of dialectical identity between space and time.

The second acknowledgement which a reading of the lecture 'Zeit und Sein' brings to light has to do with this remark: 'The attempt in *Being and Time*, §70, to trace the spatiality of Dasein back [zurückführen] to temporality cannot be sustained'.² What is at issue in this §70, to which Heidegger refers here? And is what he says here, in the form of a retraction, intended to cover this paragraph alone or does it not rather suggest, at the same time, the unsatisfactory character of the ontologico-phenomenological analysis of the spatiality of *Dasein* and of space proposed in the first section of *Sein und Zeit*?

Let us consider the first of these questions to begin with. In what does this withdrawal from what is no longer tenable (*Unhaltbar*) consist, in Heidegger's own words? To focus upon the title of this §70 alone: 'Die Zeitlichkeit des daseinsmässigen Räumlichkeit', one is obliged to recognize that there is nothing untenable to be found here. A phenomenologico-existential analysis of spatiality could very well be led to take account of temporalizing aspects, of the dominant implication of this or that temporal dimension, in the diverse modalities of the spatialization of Dasein.³ So the difficulty will have to be located somewhere other than in what, taken in isolation, is announced in the title of this paragraph alone. Once one gets into the reading of the paragraph, one quickly appreciates that Heidegger was trying to eliminate the possibility of adding to this title an 'and reciprocally' which would make it possible to write another paragraph entitled: 'Die Räumlichkeit der daseinsmässigen Zeitlichkeit.' It was precisely the possibility of just such a reciprocity which it was important for Heidegger to exclude. For it would, in addition, compromise his project of deriving historicity (*Geschichtlichkeit*) and inner-time (*Innerzeitlichkeit*) from originary temporality (*Zeitlichkeit*) alone, to the exclusion of an element of spatiality. As Didier Franck remarks, 'if "spatiality" has to intervene in the derivation of inner-time from originary temporality, the whole project called *Being and Time* would thereby be called in question'.⁴

That Heidegger himself had seen the problem presented by spatiality for his attempt to found the being of Dasein upon its ekstastic temporality, is evidenced by the claim he makes at the beginning of §70: 'Thus with Dasein's spatiality, existential-temporal analysis seems to come to a limit, so that this entity which we call "Dasein", must be considered as "temporal", "as also" as spatial coordinately.'⁵ However, for him it was precisely a matter of circumventing the menace presented by 'spatiality' by reducing this menace to a kind of semblance against which one should be protected. Couldn't such a 'semblance' lurk in this 'und auch', leading

to an alignment (*Nebenordnung*), to an identification of the spatiality and the temporality of Dasein? But such an identification would have led to nothing less than the emergence of temporality as determining, in the final analysis, the meaning of the being of Care (*Sorge*) in as much as it structures Dasein existentially. Against the risk of such an identification, of just such a linkage (*Verkoppelung*), §70 is going to try and confirm the structure of temporality as the ground (*Grund*) of the ontological constitution of Dasein and of its modalities of being, amongst which spatiality figures.⁶

It is the temporal *distentia* which is going to found the spatializing *dispersion* (*Zerstreuung*) and therefore the spacing of the distancing and of the orientation characteristic of the spatiality of Dasein. At the end of §70, this foundational primacy of time, where the out-of-itself of existing as 'temporality' founds the *Da* of Dasein, is underlined in these terms: 'Only on the basis of ekstático-horizonal temporality is the irruption of Dasein in space possible.'⁷

But surely this understanding, moving as it does from the *Da* of Dasein, stands in the way of a fuller and more complete assumption of corporality (*Leiblichkeit*), a corporality implied by all the various modes of spatialization of being-in-the-world? A difficulty of this kind was suspected early on by Erwin Straus, this phenomenological outsider, for whom: 'The *Da* in which, in Heidegger's own words [*Anspruch*], our being is thrown, is our corporality with the structure of the world which corresponds to it.'⁸ In other words, with a view to getting rid of the dualism of mind and body (which is certainly one of the principal objectives of the fundamental ontology of *Sein und Zeit*), was it really necessary for Heidegger to subordinate the spatiality inherent in corporality to ekstastic temporality?

According to *Sein und Zeit*, nevertheless, the foundation of spatiality upon temporality not only serves to secure the independence of space with reference to time but also makes it possible to understand the dependence of Dasein with regard to space and, in this way, 'the well known fact concerning the abundance of "spatial images" in language'.⁹ This 'fact', let us recall, had been thematized by H. Bergson in *Time and Free Will* where space and language are found to be intricately interconnected. As for Heidegger, he claims to be able to explain it with reference to temporality itself. Does he not see in it, after all, the sign of a dominance of the *present* as the temporal dimension of concern (*Besorgen*),¹⁰ which is the mode of being of Dasein delivered over to its concerned everydayness, by way of which, for him, its spatiality is also made manifest?

Since we are not in a position to discuss this interpretation at length, an interpretation which touches upon both language, space and time, we will limit ourselves to pointing out that Heidegger himself will not

hesitate later to circumvent it, even to pronounce it wrong. In fact however, referring the spatialized images of language solely to the spatiality of everyday praxis might well have been an indication of the deficiency of the thinking on language in *Sein und Zeit* and, more especially, of the mystification of what, due to our belonging to the earth, to our habitation between heaven and earth, 'takes place', leaves its trace in language.

But let us get back to the development of §70 as a whole. What does the insistence upon designating temporality as a foundation (*Grund*) mean if not the persistence of the gesture, even the qualified gesture, of transcendental foundation?¹¹ The allusion to Kant in §70 – and even though Heidegger expresses a concern to take up a distance with regard to the posing of the problem by the latter – is indicative of the surreptitious continuation of this gesture. For what is it in fact that Heidegger objects to in Kant? Certainly not the intellectual gesture which seems to assure a certain primacy of time over space. But rather that deficiency in the Kantian ontology which, blinded by the metaphysics of representation, fails to gain access to a true ontologico-existential comprehension of human finitude. It goes without saying that in §70 one is very close to the reading Heidegger will give of the *Critique of Pure Reason* in his *Kant and the Problem of Metaphysics*. Written at the same time as *Sein und Zeit*, this work praises Kant for having seen that the question of man belongs to the question of being. The interpretative accent is placed upon the transcendental imagination as the root of the transcendental transcendence of the imagination which, according to Heidegger, is, in the final analysis, to be identified with originary time as pure self-affection. As he sets it out at §35: 'Time is the condition of the possibility of every act which is formative of representation, that is to say, it makes pure space manifest.' And further on, he adds: 'To admit the transcendental function of pure space does not in any way imply a refusal of the primacy of time.'¹²

It is impossible to overlook the fact that such an interpretation (debatable because unilateral) precisely tended to accentuate the primacy accorded to time over space in Kant. For this primacy was one which, in a certain sense, had already been accorded to time in the *Transcendental Aesthetic*, that is, if one considers the criterion in accordance with which time, as the condition of the possibility of all representations, has a greater extension than space, since it is a prerequisite of the representations of external as well as of internal sense. To the former should be added his underestimation of the fundamentally spatial, as well as temporal, power of schematization. A primacy which, however, the *Refutation of Idealism* will serve to undermine. In any case, what concerns us here is to see how the Heideggerian interpretation of Kant, at the time of *Kant and the Problem of Metaphysics*, went along with (was congruent with)

the way in which *Sein und Zeit* had envisaged the relationship between spatiality and temporality.

From the foregoing it follows that if, as we find in §22 of *Sein und Zeit*, 'space, in a sense which has still to be determined, constitutes the world',¹³ this world, which is revealed to Dasein as belonging to its own proper structure of being (cf. Dasein as 'being-in-the-world'), would remain dependent upon Dasein (and not even, or at least only laterally, upon *Mitsein*). One sees here a subtle continuation of the privilege of interiority over exteriority, that very privilege which the understanding of Dasein, as being-in-the-world, tried to place in question. . . .

These difficulties, these apories and their consequences for the question of being were certainly foreseen, even if only in part, by Heidegger. From the beginning of the 1930s he sets out in a direction which will be thought through later as the 'turn' (*Kehre*), a turn which can be situated around 1935. But this change of direction within the frame of the same quest, that of being, is both preceded and prepared by a massive hermeneutical investment in Greek philosophy. And so begins that interpretation of Plato and of Aristotle as a function of what Heidegger understands by 'the beginning of metaphysics'. In connection therewith, he turns his attention to the question of the 'truth of being', which question now takes the place of that of the 'meaning of being', the question proper to *Sein und Zeit*. This is also the context in which we have to situate his meditation on *physis*, where he tries to rejoin pre-Socratic Greek thinking. In accordance with this 'initial' comprehension, it is being which offers itself as (*als*) *physis*, as he points out repeatedly in *Introduction to Metaphysics*.¹⁴ However, the deepening of the question of being will of itself bring with it a change of attitude with regard to the question of space. As we are now in a position to confirm on the basis of a reading of the *Beiträge zur Philosophie*, a work published in 1989 but which Heidegger composed around 1936–7. It is at this point in time, and not simply at the time of the lecture 'Zeit und Sein', that the wording *Zeit-Raum* impressed itself upon him.

Having made these points, we are left with two directions in which to proceed. The first consists in going back to the analytic of spatiality in *Sein und Zeit*, with a view to trying to bring out its limits; the second, in considering the effects of the turn (*Kehre*) on the thinking about space.

Space in the first section of *Sein und Zeit*

Let us turn to chapter III, entitled 'The worldhood of the world' (§14 to §24). Here Heidegger refuses to envisage the world as simply subsisting in space, therefore making a break with the classical attitude for which the

world did subsist, reduced to being nothing but the totality of bodies in the objective space of Euclidean geometry. In this way a critique of the attitude of modern philosophy is implied in as much as it forgets that geometrical space is itself constituted by an objectifying operation which can only be carried through on the basis of a world to which we are attached existentially and whose intrinsic spatiality we have to understand.

On the other hand, the approach to spatiality is not accomplished, as one might have expected, by way of a phenomenology of perception. The ontological strategy of *Sein und Zeit* makes this impossible. For, to isolate and privilege perception would be to abandon the concreteness of the being-in-the-world of Dasein in favour of a subject split up into a diversity of faculties or capacities. Heidegger, on the other hand, claims to have disclosed the world phenomenologically in the thickness of its concrete significations which, according to him, are first of all those which proceed from the daily practice of Dasein as being-in-the-world. From which it follows, as Franco Volpi has shown very clearly under the auspices of a 'reappropriation', that is, a creative translation of notions proceeding from the practical philosophy of Aristotle, that a certain priority has to be accorded to action and to doing in as much as, in everyday praxis, the latter both encompass and go much further than perception.

To understand such a step with regard to the problem of space, it is worth remembering that it has to be situated explicitly in the context of an attack upon Cartesian ontology which, under various forms, has not ceased to make itself felt throughout the course of modern philosophy. The confrontation with Descartes is so decisive here that it takes up the entire middle section of chapter III; from the very outset, it is stated that the exposition of the Cartesian ontology 'will furnish, by way of its antithesis [*negativen Anhalt*], a theme for the positive explication of the spatiality of the surrounding world [*Umwelt*] and of *Dasein* itself'.¹⁵ Thus, from the very beginning ontological dualism is called in question. The distinction between *res cogitans* and *res corporea* is rejected to the extent that this distinction would, if operative, obscure the spatiality proper to human Dasein while reducing the beingness of every natural being to *extensia*. With regard to a physical thing, all that is taken to be true is what manifests itself as subsisting (*Vorhandene*) for a theoretical consciousness, what can be rendered intelligible in physico-mathematical terms; the phenomenality of the world is thus relegated to the status of a subjectivo-relativistic appearance.

But whereas in Husserl's *Krisis* the critique of the forgetfulness of the *Lebenswelt* goes together with an attempt to understand the process of idealization which underpins the 'mathematization of nature' in modern physics where the interest focuses on Galileo (cf. §9), in *Sein und Zeit*

Heidegger tries above all to think the ontological legacy of such a procedure in Descartes and he interprets these ontological consequences in terms of a 'de-mundanization' of the world. This term designates the eclipse of any understanding of the effective modalities of our being in the vicinity of things with reference to the horizon and on the basis of the world. Correlatively, he talks of the de-mundanization of Dasein in modern times since thenceforward the latter takes its stand *vis-à-vis* an a-cosmic world, as a subject 'out of the world' and therefore capable of ignoring its originary spatiality.

With a view to re-discovering the spatiality of Dasein, Heidegger sets out from a description of the spatiality of the surrounding world (*Umwelt*). He takes as the guiding thread for this phenomenologico-ontological description, the being of those entities which present themselves with a primordially which precludes their reduction to *res extensa* or the in-itself of objectivist ontology. This kind of entity is one with which Dasein is concerned in virtue of the use (*Umgang*) which he makes of it in his daily life, with regard to which he is present in the mode of concerned involvement (*Besorgen*). It is those things which are close at hand (*Zur Hand*) which are ontologically determined by their availability (*Zuhandenheit*) for utilization. Thus they present themselves as tools or instruments (*Zeuge*) in their character of being-in-order-to (*Um . . . zu*): for instance, the hammer for the fabrication of the table or the construction of the house. In virtue of this structure of being which carries with it the determination of a reference to . . . (*Verweisung*), each instrument is revealed as always already inserted into a whole, an instrumental totality (*Zeugganzheit*).¹⁶ By way of an example of a totality of things structured with a view to their utilization, Heidegger evokes what happens in an office. The things which are to be found there are not disposed in such a way that each can be taken in isolation from the others. Together, and on the basis of their relations with others, they determine the 'physiomy' of the room. What we encounter in the first place is the room in that susceptibility for signification which belongs to it: an office and not just a volume geometrically defined by the four walls which its simple things fill up. We discover the room, Heidegger also tells us, as a residential instrument (*Wohnzeug*). Is it really necessary to point out that this expression betrays a thinking about dwelling, about housing, which does not go much further than a certain functionalism – which latter reminds us of what Le Corbusier was to recommend a little later, with this qualification that, in the context of an industrial civilization, Le Corbusier preferred to talk of a 'residential machine'.¹⁷

In sum the uncovering of the environment in *Sein und Zeit* shows it to be a totalization of meanings and objectives, the same as those constitutive of the connection linking instruments one with another (*Zeug-zusammenhang*, *Zeugganzes*). The analysis never ceases to implicate both

the spatiality proper to the being of an instrument and that inherent in the whole into which it is inserted. Those entities which are available for utilization are entities whose 'proximity' cannot be determined primarily by any system of measurement, but with reference to an oriented proximity which arises out of that concern which characterizes Dasein in its everydayness. The being of the instrument only acquires its meaning with reference to a practice and its proximity is therefore that of its instrumental accessibility. This does not mean that, as it were, it has to be dragged around, for it does have its place, a place where it can be found, and this implies that it is not to be regarded as a simple thing subsisting somewhere in a space which is unqualified and which has not been differentiated into subsidiary places. And just as an instrument is never encountered in an isolated fashion so a place is only what it is with reference to other places together with which it constitutes a network or a 'totality' of places (*Platzganzheit*).

In turn, since it has itself to be situated, the condition of the possibility of a totality of places lies in a wherein (*Wohin*) in general, a wherein which concerned involvement has in mind from the first. Thus every place has to be referred to a 'region', to a 'side', all of which is already implied every time one specifies the place of a thing from 'this side' rather than from 'that side'. The word we are translating by 'region' or by 'side' is *Gegend*. At the time of *Sein und Zeit*, Heidegger is still far from having thought about *Gegend* or *Gegnet*, as he will do, on several occasions, after the *Kehre*. Here these *Gegende* are still thought as a function of the spatiality inherent in everydayness. However, for the determination of these regions which, for their part, confer a more general orientation upon the space of the surrounding world, one being, the sun, plays a privileged role. For its places, though changing, are places which are constantly and regularly available for the diverse and variable uses to which we put the light and the heat which they yield. They serve to differentiate the celestial regions which furnish pre-established points of reference for the terrestrial regions which these places occupy and articulate.¹⁸

That such a purely pragmatic consideration of the sun and its 'orients' by no means exhausts the existential meaning that its course has for us is clearly recognized by Heidegger when he adds: 'Churches and tombs are disposed according to East and West, the life and death parameters which determine Dasein in its inalienable possibilities of being.'¹⁹ But should he not then have gone on to question this availability, the *Zuhandenheit* of entities as the privileged *leit motif* of the uncovering of the spatiality of the world? Before trying to do justice to this question it is worth pointing out that the spatiality of the surrounding world is only existentially relevant because it is founded on the spatiality of Dasein. In other words, the spatiality of the surrounding world presupposes the

being of Dasein, to whose spatiality it belongs essentially to adopt an orientation and to make distances disappear. Its encounter with intra-mundane entities implies a making space (*Raum geben*), an arrangement (*Einräumen*) which makes possible a range of places upheld by gestures such as 'displace', 'remove', gestures which do not require the intervention of a theoretical attitude or the constitution of a geometrical space.

The analyses of §22 to §24 proceed as we have seen, in a regressive fashion, on the basis of an uncovering of the spatiality of the world in the direction of its ontological presupposition, namely, the spatializing being of Dasein. This now permits us to formulate more exactly the questions which the approach to spatiality in *Sein und Zeit* raises.

Without recurring to the importance of highlighting the existential primacy of the practical over the theoretical, there are grounds, nevertheless, for asking ourselves whether our way of encountering the spatiality of the world and of intra-mundane entities really should be restricted to that mode of involvement which Heidegger takes account of here which, obviously, takes as its paradigm the labour of the craftsman and the world which corresponds to it. To take only one of the essential features of the *Umwelt* disclosed by Heidegger's analysis of spatiality, 'totalization': *Zeugganzes*, *Platzganzheit*. It is a matter of integrating each instrument, and the place which belongs to it, in a sort of system of reciprocal reference on the basis of which each can be uncovered in its usefulness for . . . , in its pragmatic significance. This was already implied in the *Um* of *Umwelt*, which has to be understood in its double meaning of *um* – 'surrounding' and of *um* – 'in order . . .'. But what then becomes of our exposition of the open space of a countryside which suspends, 'disorients', even if only for a moment, the prevision which characterizes 'everyday praxis'? Is it not the case that concerned preoccupation (promoting the 'hold' and the hand as the organ of prehension), even if it does make possible a revealing of the spatiality of the world of everyday praxis, nevertheless puts into effect something like a 'reduction', to wit, a 'neutralization of its phenomenal appearance'? What are we to make of the presentation or of the donation of nature in its 'grandiose spectacles' (sky, sea, mountain, waterfalls, etc.), those very aspects which Kant takes account of in his analytic of the sublime in the third Critique, where it is already a question of poetic vision?²⁰

But it is not even necessary to leave the space of the home²¹ with its affective and identificatory investments to recognize the limitations of an analytic which only considers the spatiality of the world from the standpoint of its significance and of its practicality as a function of that specific existential which is involvement.

Besides, what is one to say of those worlds in which instrumentality cannot be isolated in as much as the available entity (the tool) incorporates

from the start other determinations and references than those of its utility alone? And how, on the basis of its *configurational* aspects, can one fail to attribute to the spatiality of the world a metaphorical and symbolic tenor which, to some extent, already encompasses and surpasses the pragmatic significance which is uncovered across our daily praxis?

Last but not least, the analytic of spatiality in *Sein und Zeit* suffers from the absence of any investigation bearing on the constitutive spacing of *Mitsein*, which latter impacts not only upon our understanding of the space of the world (spaces and distances of a social order), but also upon any consideration of the spatiality of Dasein itself as well as upon the question of *Jemeinigkeit*, that is to say, the question of selfhood or identity.²² How is one to understand Dasein's character of being 'mine' if one does not take into consideration the 'here' and the 'there' constitutive of intersubjectivity which, from the start, manifests itself as an intercorporeal phenomenon – as Husserl made amply clear in his *Vth Cartesian Meditation*? Once again we rejoin the question of embodiment which the very project of *Sein und Zeit* failed to articulate more exactly in its connection with the question of spatiality and of the *Mitsein*. The articulation of this question is however anticipated, but in a largely negative way, as emerges from §10 of the Summer 1928 lectures on *Leiblichkeit*, entitled 'The problem of transcendence and the problem of *Sein und Zeit*', where *Leiblichkeit*, *Mitsein* and the phenomenon of *Raumbedeutung* as the primary determination of every language (*Sprache*), are presented as having to be understood on the basis of spatial dispersion (*Zerstreuung*).²³

However, if, at the heart of the Heideggerian meditation, this tangle of crucial questions remains undeveloped, this is not true of other issues which we shall now go on to mention. Two digressions which, in *Sein und Zeit*, follow upon the course of the analyses of the spatiality of the world will serve to confirm the above. The first of these digressions arises in the context of entities which are not produced, natural beings the recognition of which is presupposed by any product whatsoever. This recognition of non-produced goods arises, Heidegger points out, as a function, or in view, of (*Wozu*) the work to be produced. 'But when this happens, the Nature which "stirs and strives", which assails us and enthrals us as landscape, remains hidden.'²⁴ It is therefore not always possible to reduce nature to the *Zuhandenheit*, as is explicitly underlined in §44.²⁵ These remarks in their turn relativize the choice of the *Umwelt* or of the instrument (*Zeug*) as the only available clues to any elucidation of the spatiality of the world and of Dasein.

The other digression goes in the same direction. It takes into account the hypothesis of a 'primitive world'. In this regard Heidegger remarks that 'what is ready-to-hand within the world just does not yet have the mode of Being that belongs to equipment'. And he adds: 'Perhaps even

readiness-to-hand and equipment have nothing to contribute as ontological clues in interpreting the primitive world. . . .²⁶ But if these remarks place his interpretation of everydayness in a new perspective they do not, for all that, suffice to dissuade Heidegger from treating entities encountered within such a world under the negative sign of a 'not yet'. 'It does not yet have the mode of being that belongs to equipment.' And he does not even bother to ask what 'reduction' (of symbolic attributes, etc.) might correspond to just such an 'accession'. However, in the Second Section of *Sein und Zeit* (where the analytic of the First Part is reconsidered from the standpoint of the foundational element of temporality), intra-mundane entities, together with nature itself (as landscape, field for agricultural exploitation, etc.), are uncovered in their historical (*geschichtlich*) character, which latter goes along with, and is indeed inseparable from, the historicity (*Geschichtlichkeit*) of Dasein as being-in-the-world.²⁷

Nevertheless, the assumption of the historical character of the world of everyday life in this Second Section, entitled 'Dasein and temporality', an assumption which could not remain without its consequences for the question of the spatiality of the world, does not bring Heidegger to return to the disclosure of the latter; and that, as we already pointed out, because it pertained to the very project of *Sein und Zeit* that historicity should be derived from temporality alone. Be that as it may, it is no less true that the two digressions of chapter III from the First Section, that on nature and that on the primitive world, appear 'supplementary' with regard to the elucidation of spatiality as already explicitly carried through.

It is however worth noting that in *Vom Wesen des Grundes*, Heidegger tried to explain, even to give, in his own words, 'precise reasons' for the exclusion of nature from the analytic of spatiality. This is because, he tells us, the question of nature could only be introduced on the basis of the analysis of *Befindlichkeit*,²⁸ which latter is only pursued later on, namely, in the context of the analysis of that fundamental existential structure which is Care (*Sorge*). But these 'precise reasons' leave the real question entirely on one side: what of the spatiality inherent in *Befindlichkeit*, that is to say, in each of the affective moods (*Stimmungen*) by way of which Dasein experiences itself and finds itself in its being in the midst of beings? The absence of any interrogation on the spatiality of moods such as anxiety, joy, fear, boredom²⁹ can only be explained as a function of the very project of *Sein und Zeit* to found spatiality upon temporality. . . . But then, in what concerns the thinking about space, the incompleteness of this project, as well as leading to a deepening of the question of being, is going to mean, at one and the same time, an opening and the opening move of a new attempt.

Space after *Being and Time*

Even though it is always possible to find several 'turns' along Heidegger's path of thought, the critical shift is that executed in the famous turn, the *Kehre*, around 1935. With regard to what concerns space, it makes itself known in the lecture: 'The origin of the work of art' and in the course of lectures: *What is a thing?* (*Die Frage nach dem Ding*), and especially as it is only now possible to appreciate, in the text which has remained unpublished for so long, *Beiträge zur Philosophie*. Let us consider the course of lectures first of all. In the first part, Heidegger reviews the different ways in which philosophy has attempted to determine the being of the thing. He questions the relationship between the identity, the particularity of the thing and the categories of space and of time. To summarize: what is the relation of the *this* to the *here* and the *now*? Is space a simple framework, a system of co-ordinates making possible the determination of the spatial position of one thing relative to others? What are we to make of the limit, in things, between a without and a within? In the second part of the course Heidegger tries to characterize the field, the historical ground upon which the determination of the being of the thing rests in the *Critique of Pure Reason*; which determination now appears to Heidegger as the metaphysical centre of Kant's work. The point to stress concerns the gap between the Greek conception of movement and of locus and that of 'modern times', the position established by Galileo and Newton and on which Kant himself relies. For the Greeks, Heidegger recalls, thinking especially of Aristotle, 'the type of movement and the locus of the body are determined by the nature of the latter'. 'For any characterization and any estimate of movement, the earth is the centre . . . the stars and the heavens in general move *peri to meson*, around the centre, their movement being circular.'³⁰ On the other hand, with Newton, 'any body left to itself moves in a straight line and in a uniform fashion'.³¹ It is important to appreciate the consequences of such a transformation. For it not only affects the understanding of movement and of nature but also the position of *Dasein* at the heart of being. Among the consequences mentioned, let us consider, in particular, the change which the concept of *locus* undergoes. 'The locus', writes Heidegger, 'is no longer the place to which a body belongs in virtue of its intimate nature but simply a position which it assumes from a purely relative standpoint, that is to say, in relation to other positions.' Henceforward, 'the difference between terrestrial and celestial bodies becomes otiose'.³² What could this mean if not that the gap between the sky and the earth is abolished and that loci are now only neutral positions? The result is a flattening of physical space which, in accordance with a purely geometrical representation, is, from now on, nothing but a homogeneous medium whose attributes can only be derived from mathematical rep-

resentation. Conceived in this way, space does not have much to do with the spatiality of the world in which we find ourselves. What is more, it conceals this spatiality. This concealment, which touches both the spatiality of the world and that of Dasein, was thought by Heidegger in *Sein und Zeit*, on the basis of the Cartesian ontology and its dualism. In the course of lectures *Die Frage nach dem Ding*, on the other hand, where the interpretation of the history of philosophy is tied together around Kant, he envisages it on the basis of classical physics while at the same time recognizing, as Catherine Chevalley's paper (chap. 63, vol. IV of the present work) shows, that this physics is itself, at least in part, called in question by the new physics. Such then is the hermeneutical background against which Heidegger takes command, little by little, of a thinking about dwelling which proceeds along the same lines and conjointly with his thinking about being.

In addition, the lectures already announce two themes which are absent from the analysis of the spatiality of the surrounding world in *Sein und Zeit*, namely, that of the Earth and that of place (*Ort*). While in *Sein und Zeit* it was above all a question of 'place' (*Platz*), and of a 'network of places' (*Ganzheit von Plätzen*) seen as a function of the readiness-to-hand (*Zuhandenheit*) of an equipmental whole, it will from now on be a question of place (*Ort*) and of the relation between space and place. He goes back to the lecture, 'Der Ursprung der Kunstwerk', contemporary with the course of lectures, to deepen these themes. In this lecture, Heidegger further pursues his investigation into the thinghood of the thing and into the equipmental being of equipment but with this difference, that he now does this with a view to bringing to light the truth of the thing, or of equipment, on the basis of its manifestation in the work of art.

The inadequacy of the traditional determinations of the being of thing stands out most evidently when one questions the work of art. Thus the different philosophical conceptions of the thing stemming from the tradition, whether as 'informed matter' (*geformter Stoff*), or as 'support of qualities' (*Träger von Merkmale*, substantia + accidens), or as the 'unity of a multiplicity of sensations' (*Einheit einer Mannigfaltigkeit des in den Sinnen Gegebenen*) give themselves away as so many obstacles to any approach to the true being of the thing, and a fortiori to the truth of the being of the work of art. This obstacle has to be set aside as the condition without which it is impossible to open the way to an alternative approach to the question of truth. Normally tackled as arising out of the domain of science, as an epistemological affair, the question of truth is here paradoxically posed in terms of the work of art. Art is going to be set up by Heidegger as the phenomenological site where the truth of the being of entities makes its appearance. But if, as he says, art is the realization of truth, this can only be because the truth is not first and

foremost the object of a theoretical attitude, that it does not consist initially in an *adequatio rei et intellectus*. Rather than being conveyed by an objectifying judgment, the truth takes place as an event in the work of art. Thus Heidegger offers an alternative to the dramatic Nietzschean opposition between art and truth, 'an opposition summed up in *The Will to Power* with the adage: 'We possess art lest we perish of the truth',³³ namely, an alternative which might be expressed as follows: art as the realization of the truth.

This occurrence, this taking place of the truth is in turn set in relation to what Heidegger identifies as structuring the work of art. This 'structure' is not something internal to the order of 'representation' and which would be connected with the formal aspects of the work. It is identified by way of a contrast with what in *Sein und Zeit* was said on the subject of production: equipment (*Zeug*) or work (*Werk*). Here, what is produced refers back to what is not produced as to a simple material; for such is the understanding of natural beings brought to light from the standpoint of everyday praxis. The forest is considered as wood, the river as yielding hydraulic energy. The 'material' is absorbed into the product, the work itself being grasped in its being-for . . . depending on the use to which it is put. But in breaking the chain of utilitarian references in which the 'product' is caught up, the work of art opens up a more essential access to the truth of the product, a truth which is also the truth of the world to which the product belongs; in other words, that of the site to which it bears witness. As a guide to his meditation Heidegger chooses a canvas of Van Gogh in which shoes are depicted, shoes which he takes, in a way which is both debatable and has been largely debated,³⁴ for the shoes of a peasant. This meditation, which neglects the aesthetic aspects of the work in order to come to terms with its theme, to the point of making it impossible to identify the work in its singularity, can be summed up in two affirmations: 'Across these shoes', Heidegger writes, 'there passes the silent appeal of the *earth*.' And further on: 'This product belongs to the earth. It harbours the *world* of the peasant.'³⁵

By relating to the thing in this way, the shoes are made to appear in the work and in relation to what is co-signified in the work, that is, an Earth and a world. Thus Heidegger's meditation on Van Gogh's canvas makes Earth and world appear as the polarity which both holds open and furnishes our dwelling space with its dimensions. It does therefore point towards the rootedness of dwelling in a soil, a theme which, at the time, was not exempt from ideologically ambiguous connotations but which, at least in Heidegger's writings, was not associated explicitly with the theme of blood or with racism.³⁶

The second example of a work of art invoked by Heidegger will permit him to give a further and more adequate account of his thinking about

dwelling while at the same time furnishing him with an opportunity to consider the nature of the relation of *place* and *space*. Now the work in question is a Greek temple. This is what he has to say.

It is precisely the temple as a work which disposes and collects around itself the unity of the ways and relations through which birth and death, misery and prosperity, victory and defeat, endurance and ruination confer upon human being the shape of his destiny.³⁷

It is clear that the 'Greek temple', taken with this kind of generality, is not being considered from an architectonic standpoint but as a *place* that unites around itself an entire network of ways and significations which articulate its space and give a meaning to dwelling. This meditation invites the reader to move beyond the point of view of what would be an aesthetic objectification and so to see the temple at work in its efficacy as a work. The temple installs a mortal world, that of the Greeks, in as much as it articulates its topology and its signifying configuration at the same time as it makes the Earth manifest and, without annihilating its obscure face, makes manifest its power of withdrawal, its reserve, the gateway opening upon being. The temple therefore constitutes the link, the unifying trait between an Earth and a world. It is thanks to this landmark that an earth can manifest itself and appear as native soil (*der Heimatliche Grund*), and that a space of dwelling is thereby outlined. To sum up, a space *qua* dwelling, has to be thought on the basis of the places which it articulates.

Starting from the lecture: 'Der Ursprung des Kunstwerkes', dwelling impresses itself as one of the most constant of Heidegger's meditative themes. This is attested in a much later text which merits our attention not only because it condenses a number of previously conducted analyses but also because it rings the changes on the terms employed in the lecture of 1935. We are talking of the lecture 'Building dwelling thinking', given in 1951 at the 'Second Darmstadt Symposium', a symposium devoted to 'Man and space'.

Before we begin, let us note that in the period between the lecture of 1935 ('Die Ursprung der Kunstwerk') and that of 1951 ('Bauen Wohnen Denken'), Heidegger's thinking on space is nourished by considerations stemming from the notion of *chora*. This is a very typically Heideggerian move. Greek thought, and especially pre-Socratic thought, provides him with the occasion for a remarkable meditative prolongation but one which, in reality, takes him further away rather than bringing him closer to the Greek text. Moreover, to all appearances the meditation sets out from a pre-Socratic expression while leading to something else, without this something else ever being consciously assumed. To take Heraclitus' fragment 109: in his course of lectures *Heraklits Lehre vom Logos*

(Summer term 1944), while criticizing the usual translations of *kechoris-menon*, Heidegger remarks that in *chorizein*, *chora* is to be found. This furnishes him with a pretext to 'translate' the Greek in a creative fashion, that is to say, not only to find in it a linguistic equivalent, namely, *Gegend* or *Gegnet* in the sense of surrounding world (*Umgebung*, *die umgebende Umgebung*), but, on the basis of this 'finding' to develop a meditation taking as its guide the distinction between *topos* (*Ort*) and *chora* (*Gegend*, *Gegnet*).³⁸

The meditation on *die Gegend* and its old form *Gegnet* is developed and deepened in 'Conversations along a country path' ('Feldweggespräch'), written a little after the course on Heraclitus to serve as a 'commentary' on *Gelassenheit*.³⁹ In this work, the accent is placed henceforward on the opening of *Gegend*. It names the opening which surrounds us (*das umgebende Offene*) and on the basis of which everything that is, is able to make its appearance. It is the *Gegnet* as 'free extent' (*die freie Weite*), with which we can enter into a relation of resonance, provided only that the things (*die Dinge*) which appear therein 'should have lost their objective character'.⁴⁰ The thinking about the *Gegend* is therefore the passage required in order to leave the terrain of representative thinking to which, according to Heidegger, Husserl's thinking about the transcendental horizon still belonged. In this sense, to take up again Heidegger's own words, it has to be seen as signifying 'the end of philosophy' and inaugurating (as the title 'conversation on thinking' suggests), 'the beginning of thinking', one might even say, of poetic thinking.

What distinguishes the region, the *Gegend*, is its gathering character. It holds together (*versammelt*) and unifies a plurality of places. Heidegger's thinking experience around the notion of *Gegend*, an experience which marks a break with an objectifying representation of space in favour of a meditative (rather than contemplative) approach arising out of concrete (non-abstract) language, must not be lost sight of when one tries to understand the lecture 'Bauen Wohnen Denken'. As its title indicates, this lecture is directed towards the question of dwelling. But the activity of building will have to be taken account of in a manner quite different from that implied by the means-ends schema which, he now tells us, 'closes off any access to essential relations'.⁴¹ We are certainly far from *Sein und Zeit*. . . .

What then does 'building' mean? To this question the answer would seem to be obvious: to construct according to a plan. But the answer undertakes a detour which brings to light the several layers of meaning encompassed by the word 'build'. For the root of the word *bauen*, *buon* means 'to dwell'. If this is so, the normal order of understanding (one builds to dwell) has to be inverted, and not because dwelling, or *bauen*, would come first chronologically but because, in *bauen*, building, *wohnen*, or dwelling is already in question. By that is meant that we

build according to the manner in which we dwell which is, in turn, the manner in which we *are* on the earth. By means of *bauen*, in the sense of dwelling, an unusual link is instituted between dwelling and being. Just such a link had already been outlined in the context of §12 on *In-Sein*. . . . But the implications of this link in what concerns space had not been drawn. Here, it is thanks to the etymological resources of language that the link can be made.

'I am' [*ich bin*], 'you are' [*du bist*] mean: I dwell, you dwell. The manner in which you are and in which I am, in which we other humans are on earth is dwelling. To be human means to be on earth as mortal, that is to dwell.⁴²

It is clear that 'being-in-the-world' is henceforward to be understood in terms of dwelling and that, in consequence, our dwelling and the spatiality which belongs to it can no longer be uncovered on the basis of everyday *praxis* alone. It encompasses all the dimensions of our human sojourn here on earth. It is therefore the configuration essential to that very sojourn which it is a question of clarifying. 'Bauen Wohnen Denken' refers back to the lecture 'Das Ding' which precedes it by about one year. In the two lectures, the configuration of dwelling is thought as a fourfold game. To dwell is to sojourn here 'on earth' and 'under heaven' which is its overhang. But to be on earth and under heaven means, in addition, 'to dwell in the presence of Gods [*Göttlichen*]' and to belong 'to the community of men'. Such are the names given to the terms in accordance with which the game of the world takes place and which have to be thought not separately but in line with the unity which they constitute. This is what is expressed by the prefix *ge* of the singular form *Geviert*. Dwelling now appears in the light of the game which gives it its dimensions, which is its measure. The polarity earth-world from 'The origin of the work of art' gives way to the world no longer understood as one of the terms of this opposition but as the unity of that game which joins earth and heaven, mortals and divinities.

From a schematic point of view one sees here a kind of 'square', which, by the way, is one of the most ancient figures of space, referring back as it does to the four cardinal regions (*Gegende*). All the same, for Heidegger, the *Geviert* is not a spatial representation. It signifies the gathering, the non-separation of terms which are distinct but between which a dwelling is played out. Unquestionably, though he makes no such allusion, Heidegger's meditation on the world reminds one of that passage from the *Gorgias* where Plato has Socrates say:

Wise men, Callicles, say that the heavens and the earth, gods and men, are bound together by fellowship and friendship and order and

temperance and justice, and for this reason they call the sum of things the 'cosmos', the ordered universe, my friend, not the world of disorder or riot.⁴³

But what with Plato was motivated by considerations pertaining to equality, the harmony necessary to instil wisdom in the individual and justice in the city takes on with Heidegger the meaning of an implicit critique of uni-dimensional dwelling, that kind of dwelling which no longer accords a place to the sacred in as much as it reduces the truth within the limits of scientific objectification. The figure of the *Geviert* allows him to break down what he himself had called the 'spherical character' of modern metaphysics, meaning that sphere of subjectivity which absorbs the world into the sphere of representation, thereby preventing Being from being considered on the basis of the Openness of Being.⁴⁴

Let us get back to building and to dwelling. Once dwelling has been thought in the light of a world-play, of *Geviert*, which latter stands opposed to *Gestell*, that is to say, to any imposition of technico-scientific rationality upon the world as a whole, it becomes possible to address the question of the constructed thing without running the risk of missing the belonging of building to dwelling. The constructed thing is in this case the bridge, any bridge. The meditation does not take it into account as might the engineer or the architect but in such a way as to let the totality of relations which attach it to the earth stand out. For the bridge gathers together the banks (while still permitting the river to flow) and the heavens (from which it receives its waters). Furthermore, it gathers together men (to whom it affords a passage) and the Gods (whose patron saint dwells there in effigy).⁴⁵ Only in this way, that is to say, provided one takes account of the plenitude of its signifying relations is the bridge truly thought on the basis of dwelling. The constructed thing has as its essence the management of places or, as he writes: 'The place does not exist before the bridge.' In other words, a place *qua* dwelling place cannot be defined by simple geometrical co-ordinates and on the basis of a homogeneous representation of space. It is not in space. On the contrary, it is on the basis of such places as a bridge that 'places and the various ways in which space is managed can be determined'.⁴⁶

This way of thinking about space on the basis of place was already present in 'The origin of the work of art' in the considerations relative to the subject of the Greek temple. However, the text 'Building dwelling thinking' places the main accent upon the specificity of the constructed thing which, *qua* place (*Ort*), is capable of generating space. As one of his recapitulative proposals puts it: 'The spaces we negotiate daily are "managed" by places whose being is founded on things like buildings.'⁴⁷ The simplicity of the meditation should not be allowed to obscure the

displacement which it aims to put into effect. It is a matter of tearing our thinking about space away from the horizon of a mathematization which reduces it without, for all that, going back to a 'physics' in the Aristotelian sense of the term. What he has in mind is another way of thinking place, whereby it is both given and expressed at one and the same time as dwelling place. For what was said of the thing is also valid of place, namely, that, from all antiquity, our thinking has been habituated to assess its being too poorly.

In 1969, in one of his last texts, *Die Kunst und der Raum*, Heidegger returns to the necessity of thinking the space installed by art in terms other than a subjectively conditioned transformation of the objective space of a physico-technical project. The key here are the plastic arts, a term which, in accordance with the German aesthetic tradition, applies equally well to architecture as to sculpture. Once again he appeals to that comprehension of art which emerged from 'The origin of the work of art', namely, art as the work of truth, in as much as truth means here the non-retreat, the uncovering of being (*die Unverborgenheit des Seins*). But if space managed or installed by a work of art can be called true in the sense that it is the place where an uncovering of being takes place, the question arises whether it is possible to discover what really constitutes the reality (*Eigentümlichkeit*) of this space. For Heidegger, this comes down to asking what lies concealed in the word *Raum*. He finds in the latter the dynamic trait of spacing, of *das Räumen*, in the English sense of 'making room'. This spacing is a liberating, a detaching with a view to the establishment of a dwelling. It is therefore a liberation with a view to the emergence of a dwelling place, of an apportionment of places. This meditation on spacing does not invert the relation place-space as it was thought in the previously quoted texts but brings out yet more forcibly the necessity for an inhabited space, founded on constructed things, to take place on the basis of the open space of a region (*Gegend*). Thus *Die Kunst und der Raum* interweaves the two threads of Heidegger's meditation on space: that which, starting out from an investigation of the being (*Wesen*) of the work of art, renews the thinking of the relation place-space and that which considers the region (*Gegend*), the free Extent (*die freie Weite*), on the basis of *Ereignis*. We shall return to this.

But what does the 'plastic' bring to the thinking about place and space, subject, of course, to the qualification that, as we stressed above, Heidegger's analyses are never directed toward a phenomenal appearing of individual works but attempt to read across art and its works a common structure of truth? While admitting the inadequate character of his remarks Heidegger attempts to think the plastic arts (architecture and sculpture) as 'places which become embodied and which, by opening a region and taking it into their safe-keeping gather together around

themselves a free space which accords to each thing a sojourn and to man a dwelling amidst things'.⁴⁸ In this way, the abstract character of an approach which makes of a work a simple volume with an enveloping surface which brings out the contrast between an interior and an exterior space is called in question. This point of view is abstract in the sense that it separates the edifice or the sculpture from the dwelling and ignores its capacity to gather man together at the very heart of a region. In addition, the work makes the place appear in its relation to the void. A void which is not a lack or a defect but whose productive efficacy has to be shown in the coming into being of a place.

Leaving architecture behind (the Greek temple) and turning towards sculpture, could we perhaps find a body of work which corresponds to Heidegger's meditation? Even though his text does not include any reference to a specific work, we shall at this point risk the name of Henry Moore. Surely the works of Moore are able to play with the void in such a way that, by defying the principle of organic continuity, they often introduce a discontinuity into the body, even a void? In addition, surely they resist the enclosure of a museum and seek to give birth to a place which gathers around itself the space of a region? This at any rate is what Roland Penrose suggests when he writes:

No site seems to defy sculpture more radically than the sky and the open horizon of a countryside and yet it's here that Moore finds the greatest affinity between nature and his own works. The wild slopes of the Scottish moors where several of his bronzes have been erected reinforce the grandeur and the dignity of this presence.⁴⁹

At the end of *Die Kunst und der Raum*, the reference to the plastic arts is revoked. The realization of the truth which reveals space in the work of art can do without any support, any plastic incarnation, and simply float in the air or vibrate in song, in the voice or in the sound of church bells. This is the meaning of the quotation from Goethe with which this meditation comes to an end:

Es ist nicht immer nötig, dass das Wahre sich verkörpere; schon genug, wenn es geistig umherschwebt und ubereinstimmung bewirkt, wenn es wie Glockenton ernst-freundlich durch die Lüfte wogt.⁵⁰

Other passages by Heidegger from about this same period are in agreement with this saying by Goethe. So, for example, we find him writing in 'The end of philosophy and the commencement of thinking': 'However, the clearing, the open, is not only free for brightness and darkness, but also for resonance and echo, for sounding and resounding. The clearing is open for everything that is present and absent.'⁵¹

Texts such as these insist upon an experience of space as the Openness which is revealed just as well by the place instituted by the work of art (whose surface vibrates to the play of light and shade) as by the resounding of sound (the church bell, for example) or of the voice. The possibility of thinking about art without resorting to the banal opposition of the temporal and the spatial arts is hereby subtly announced, since sound or voices call for that very openness of space which they at the same time bring to light.

The formula *Zeit-Raum* refers to just this experience, this temporal as well as spatial proof of the Open, as the medium in which the donation of being occurs. Already employed in *Beiträge zur Philosophie*, that is to say, in the earliest outlines of a thinking about *Ereignis*, it is in 'Zeit und Sein' that this formula takes on its full meaning. In fact, it is in this text that there arises the equivalence: *Es gibt Zeit, Es gibt Raum*: an equivalence which itself refers back to the experience of the donation of being: *Es gibt Sein*. Since for Heidegger it is the primary task of thinking to be the guardian of being, this task requires that the relation of space to *Ereignis* be taken care of.

As regards the nomenclature *Zeit-Raum*, a question remains as to whether it has anything to do with *you-zhou*, the term by means of which Chinese thinking calls 'space-time' the universe. Is the posing of such a question an underlining of the necessity of what Heidegger himself terms the ineluctable dialogue with the East? But such an unavoidable alignment also seems to mean that the thinking of the donation of being with Heidegger definitely turns its back on any thinking about a transcendence beyond space and time. This is all the more evident in view of the fact that Heidegger, in his project of the 'destruction' of metaphysics, abolishes any philosophical distinction between cosmology, psychology and theology, thereby wishing to suppress any 'creaturely' dependence between *cosmos* and *theos*, between the *cosmos* and the creative *logos*.

Let us leave these questions in abeyance, no matter how critical they might be and conclude more modestly with the question of inhabited space. There can be no question that the Heideggerian meditation frees the question of space from the disciplinary boundaries within which it used to be incarcerated (geometry, physics, geography, cosmology) or the limits which continued to be assigned to it by transcendental philosophy and by the philosophies of interiority. In this sense it still remains to be shown how Heidegger distanced himself little by little from the kind of Augustinian thinking which was so near and dear to him right up to *Sein und Zeit*, especially in what concerned time. As we have tried to show, thinking about space in its inseparable connection with time became with him a thinking about dwelling, which latter is in itself a thinking about Being. To get to this point called for a conversion of the

utilitarian and controlling viewpoint into a viewpoint consonant with the Opening of Being, a Being which is announced in every being but to which only poetic speech and meditative thinking is capable of responding, of appropriating in the manner required by *Ereignis*.

It nevertheless remains true that in his path of thought, his *Denkweg*, Heidegger left to one side all the social and political aspects of the space of dwelling. He missed their hidden dimensions. Moreover, the transformation in our ways of dwelling, of communicating, brought about by the scientifico-technical complex, were only envisaged by him from the negative standpoint of the forgetfulness of Being, the inverse of the positive standpoint of the domination of beings. It was Heidegger's personal idiosyncrasy that he refused the experience of the city, no doubt seeing in cosmopolitanism and cultural pluralism nothing but a rootlessness which might be captured in the expression 'the desert extends'. One certainly has no right to object to his preference for country paths and little towns like those German university towns in which he taught. And yet, without minimizing the defects of the cities and their degradation of our civilization, can one not also see therein the crucible of a unique experience, that of a plural society in which a new consciousness of self and of humanity might eventually emerge? This too deserves to be thought. Without wishing to underestimate the significance of his thinking about dwelling and the experience appropriate to it, should we not nevertheless recognize that, in the cities too, not to mention the planetary village, the Gods, as well as poets, may very well be present?

22 In a passage from *Vom Wesen des Grundes* (GA 9), Heidegger tries to explain the approach to the Me and the You on the basis of being-self by noting that in *Sein und Zeit* it was only a question of being-self, of neutral selfhood, even when the sexual difference was in question. What interests us here is to note that at no time does he articulate the question of selfhood in connection with intersubjective spacing, which latter is however implied in the distinction of 'mine-thine'.

23 See GA 26, S. 173-4. The work by D. Frank, *Heidegger et le problème de l'espace* turns around these questions.

Heidegger on time and being

Joseph J. Kockelmans

Introduction

On January 31, 1962, Heidegger gave a lecture at the University of Freiburg in a Studium Generale directed by Eugen Fink. The title of the lecture, 'Zeit und Sein',¹ is a reference to the third section of the first part of *Being and Time*, which was originally announced under that title in 1927, but not published at the time. The first part of *Being and Time* was devoted to an interpretation of *Dasein* in terms of temporality, and to an explanation of time as the transcendental horizon for the question concerning the meaning of Being.² In 1927, however, Heidegger felt he was not able to deal adequately with the theme indicated by the title of the third section of Part I of the book and decided therefore to publish his work in incomplete form.³ In 1962 Heidegger stated explicitly that the lecture, 'Zeit und Sein', represented an attempt to solve the question which had been left unanswered in *Being and Time*; what he said in his lecture on the issue, however, is substantially different from what he would have said about it, had the essay been written in 1927. 'That which is contained in the text of this lecture, written 35 years later, can no longer be linked up with the text of *Sein und Zeit*', Heidegger wrote. 'And yet the leading question has remained the same; however, this simply means that the question has become still more questionable and still more alien to the spirit of the time.'⁴

A first reading of the text shows that in 1962 Heidegger continued to subscribe to the *basic* ideas developed in *Being and Time*. Therefore, however new this essay may be in many aspects, one must read it so that its interpretation will remain in harmony with the basic conception of his original view.⁵ On the other hand it is clear, also, that the text of the lecture contains many elements which transcend the general perspective of *Being and Time*. This is due mainly to the fact that Heidegger's

investigations from 1927 to 1962 on the meaning of Being (*Sein*) opened up new insights which could not have been expected on the basis of *Being and Time* in 1927. One sees in the Time-lecture, too, that whereas Heidegger's view on the meaning of Being and the aboriginal Event (*Ereignis*) is the same as that found in the main works written from 1935 to 1962, the conception of time defended in it is relatively new, and the explanation of the relationship between time and Being and their mutual relationship to the aboriginal Event (which constitute the main themes of the lecture), again move along lines which are new and partly even surprising.

The questions I wish to deal with in this essay are the following:

1) Precisely what does the Time-lecture say about 'time'? 2) How does Heidegger conceive of the relationship between 'time' and Being? 3) What does he say about the relationship between 'time' and Being on the one hand and the aboriginal Event on the other? But in order to be able to compare the later view with the view found in *Being and Time*, I wish first to add a few reflections on Heidegger's original conception of time and attempt to present an idea of what Heidegger might have said in the section 'Time and being', if it had been published in 1927. It seems to me that this way of approaching the Time-lecture is the one which will best enable us to appreciate the new ideas suggested here.

I am well aware of the fact that all of these questions are difficult as well as of far-reaching importance for a genuine understanding of Heidegger's thought. Obviously, I shall not be able to deal exhaustively with them within the space limitations set for this essay. But I hope, nonetheless, to be able to bring to light the elements which are vital for a preliminary understanding of the contributions Heidegger wished to make in his 1961 essay.

I Heidegger's original conception of time (1927)

As the title of the book would suggest, the concept of time occupies a privileged position in *Being and Time*. Already in the book's brief preface Heidegger presents his view on how Being and time are to be related. 'Our aim in the following treatise is to work out the question concerning the meaning of Being. . . . Our provisional aim is the interpretation of time as the possible horizon for any understanding whatsoever of Being.'⁶ In the title of the first Part of the book Heidegger returns to this relationship: the interpretation of *Dasein* in terms of temporality (*Zeitlichkeit*), and the explication of time as the transcendental horizon for the question concerning the meaning of Being.⁷

The first part of the Book consists of two major divisions: A preparatory analysis of *Dasein* and a second division on the relationship between

Dasein and temporality (*Zeitlichkeit*). In the first division Heidegger takes as his guiding clue the fact that the essence of man consists in his ek-sistence, that toward which man stands out is 'the world', and thus that for this reason man can be described as 'Being-in-the-world'. The main task of the first division is to unveil the precise meaning of this compound expression; but in so doing the final goal remains the preparation of an answer for the question concerning the meaning of Being. Heidegger justifies this approach to the Being-question by pointing out that man taken as Being-in-the-world, is the only being who can make himself transparent in his own mode of Being. The very asking of this question is one of this entity's modes of Being, and as such it receives its essential character from what is inquired about, namely Being. 'This entity which each of us is himself and which includes inquiring as one of the possibilities of its Being, we shall denote by the term "*Dasein*".'⁸

A preparatory analysis of *Dasein*'s Being can only serve to *describe* the Being of this being; it cannot interpret its meaning. As a preparatory procedure it merely tries to lay bare the horizon for the most primordial way of interpreting Being. Once this horizon has been reached, the preparatory analytic of *Dasein* is to be repeated on a higher, genuinely ontological level. Heidegger repeats here that this horizon is to be found in temporality, taken as the *meaning* of the Being of *Dasein*. That is why on a second level all structures of *Dasein*, exhibited provisionally in the first division, must be re-interpreted as modes of temporality. But in thus interpreting *Dasein* as temporality, the question concerning the meaning of Being is not yet answered; only the ground is prepared here for later obtaining such an answer.⁹

If it is true that *Dasein* has a preontological understanding of Being and if it is true that temporality is the meaning of the Being of *Dasein*, then one can show that whenever *Dasein* tacitly understands and interprets Being, it does so with time as its standpoint. Thus time must be brought to light as the horizon for all understanding of Being and this horizon itself is to be shown in terms of temporality, taken as the Being of *Dasein* which understands Being. It is obvious that in this context our pre-philosophical conception of time is of no help and the same thing is true for the conception of time which has persisted in philosophy from Aristotle to Bergson. This traditional conception of time and the ordinary way of understanding time have sprung from temporality taken as the meaning of the Being of *Dasein*.¹⁰

Normally we conceive of time as an endless succession of 'nows', whereby the 'not-yet-now' (future) passes by the 'present now' to become immediately a 'no-longer-now'. The future thus consists of the 'nows' that have not yet come, whereas the past consists of the 'nows' that once were but no longer are; the present is the 'now' which at the moment is. On the basis of this conception we can make a distinction between

temporal and non-temporal entities; 'temporal' then means 'being in time'. Thus time, in the sense of 'being in time', functions as a criterion for distinguishing realms of Being. No one has ever asked the question of how time can have this distinctive ontological function; nor has anyone asked whether the authentic ontological relevance which is possible for time, is expressed when time is used in such a naively ontological manner. These questions must be asked here and it will be clear that if Being is to be understood in terms of time and if its various derivatives are to become intelligible in their respective derivations by taking time into consideration, then Being itself must be made visible in its 'temporal' character; but in this case 'temporal' no longer means 'being in time'. From this perspective even the non-temporal and supra-temporal are 'temporal' with regard to their being, and this not only privatively but also positively. It is this temporality of Being which must be worked out in the fundamental ontology whose task it is to interpret Being as such.¹¹

Temporality is furthermore the condition which makes historicity possible as a temporal kind of Being which *Dasein* itself possesses. Historicity stands here for the state of Being which is constitutive for *Dasein*'s coming-to-pass (*geschehen*) as such. *Dasein* is as it already was and it is what it already was. It is its past, not only in the sense that its past is, as it were, pushing itself along 'behind' it, and which *Dasein* thus possesses as a kind of property which is still present-at-hand; *Dasein* is its past in the way of its own Being which, to put it roughly, 'comes-to-pass' out of its future on each occasion. *Dasein* has grown up in a traditional way of understanding itself interpretatively. Its own past, which includes the past of its generation, is not something which just follows along after *Dasein*, but something which already goes ahead of it. But if *Dasein* itself as well as its own understanding are intrinsically historical, then the inquiry into Being itself is to be characterized by historicity as well. Thus by carrying through the question of the meaning of Being and by explicating *Dasein* in its temporality and historicity, the question itself will bring itself to the point where it understands itself as historical (*historisch*).¹²

After making these preliminary remarks which merely describe what is to be accomplished by the analytic of man's Being, Heidegger does not return to the question of temporality and time until the last chapter of the first division which is devoted to care (*Sorge*) as the genuine Being of *Dasein*. In trying to explain just what is meant by the compound expression 'Being-in-the-world' Heidegger first focuses on the ontological structure of the world,¹³ then he tries to answer the question of who it is that *Dasein* is in its everydayness,¹⁴ and finally proceeds to explain what is meant by 'Being-in-as-such'.¹⁵ In the introduction to this last issue Heidegger explicitly repeats that that being which is essentially constituted by its Being-in-the-world, is itself in every case its own 'there'

(*Da*). When one speaks of the *lumen naturale* in man, one refers to this existential-ontological structure of man that he *is* in such a way that he is his own 'there'. This means among other things that *Dasein* carries in its ownmost Being the character of not being closed off; *Dasein* because of this 'there' is to be characterized by its disclosedness. By reason of this fundamental disclosedness *Dasein*, together with the Being-there (*Da-sein*) of the world, is 'there' for itself. In the existential constitution of *Dasein*'s disclosedness three equally constitutive components are to be distinguished, namely original understanding, original mood, and *logos* (*Rede*).¹⁶

After explaining the meaning of the compound expression 'being-in-the-world' along these lines by describing its basic constitutive elements, Heidegger sets out to account for the unity of *Dasein*'s Being: How are the unity and totality of that structural whole which we have pointed out, to be defined in an existential-ontological manner?¹⁷ Heidegger tries to answer this question by pointing out first that care (*Sorge*) is the unifying factor which integrates into a unity the multiple elements of the Being of that being whose Being is precisely such that it is concerned about its own Being. By taking his point of departure in a descriptive interpretation of anxiety (*Angst*) Heidegger is able to show that *Dasein* is a being who has the inexhaustible potentiality of transcending beings into Being; but, if *Dasein* has the ek-static nature of ek-sistence, it is always ahead of itself. *Dasein*'s ek-sistence, however, is essentially co-determined by thrownness; *Dasein* is like a process which is not its own source; it always is already begun and yet it is still to be achieved. Finally, *Dasein* in its essential dependence upon world is fallen to the 'world', to the intramundane things of its everyday concern and thus caught by the way things are publicly interpreted by the 'they'. Ek-sistentiality taken together with thrownness and fallenness explains why the very Being of *Dasein* is to be understood as care.¹⁸

In order to be able to show *Dasein*'s Being in its totality Heidegger turns to *Dasein*'s final term, death. He describes death as a genuine, but also as the ultimate possibility of man's Being. It is that possibility in which man's own Being-in-the-world as such is at stake. Death reveals to man the possibility of his further impossibility. In other words, death is that possibility which makes the potentiality which *Dasein* is, limited through and through. Man is thoroughly and irretrievably finite because his own death is that fundamental possibility which from the very beginning leaves its mark upon man's life and, thus, is a manner of Being which *Dasein* must assume as soon as it begins to ek-sist.¹⁹

In his fallen condition *Dasein* tries to forget the authentic meaning of death so that the question now becomes one of how one is to come to an authentic interpretation of the meaning of death, and thus to genuine authenticity. In Heidegger's view this can be shown by interpreting the

basic constituents of care (ek-sistence, facticity = thrownness, and fallenness) in terms of an existential-ontological conception of death.

Dasein which has come to authentic Being knows that death is constitutive for all of its possibilities and that the ultimate possibility of its own ek-sistence is to give itself up.²⁰ If *Dasein* genuinely realizes this then it no longer flees from the definitiveness of its end and accepts it as constitutive of its finitude and thus makes itself free for it.²¹ Now at the moment that *Dasein* understands death as its ultimate possibility, as that possibility which makes its own Being impossible, and at the moment that it accepts this final possibility as its very own by listening to the voice of conscience,²² *Dasein* begins to become transparent to itself as that which it is in itself, in its own Self. For death does not just appear to *Dasein* in an impersonal way; it lays claim to it as this individual *Dasein*. By listening to the voice of conscience, by really understanding the genuine meaning of death in 'guilt', and by accepting it as its own death, *Dasein* breaks away from inauthenticity in resolve.²³

Now it will be obvious that if all of this is to be true, then man's Being must be intrinsically temporal and temporality, in the final analysis, must constitute the primordial ontological basis of *Dasein's* ek-sistentiality.²⁴ For what does the authentic man do? He realizes his radical finitude by anticipating death, by including it in advance in every project. By anticipating death in all its projects *Dasein* receives its Being precisely as its own, as its ownmost 'personal' ek-sistence so that it really comes to itself.²⁵ But this coming-to-itself is what is meant by 'future', if the term is taken in its primordial sense: This letting itself come towards itself in that distinctive possibility which *Dasein* has to put up with, is the primordial phenomenon of *Zu-kunft*, coming-towards, future.²⁶

But *Dasein's* temporality extends not only to the future; it has also the character of a 'having been'. *Dasein* can project itself towards its own death only insofar as it already is. In order to realize its ownmost Being, *Dasein* has to accept, together with its own death, also its thrownness, its facticity, that which it is already. Death cannot be *its* death if it has no relation to what *Dasein* already is. Authentically futural, *Dasein* is equally authentically 'having been' (*Gewesen*). To anticipate one's ultimate and ownmost possibility is to come back understandingly to one's ownmost 'having-been'.²⁷

Thus far we have seen that *Dasein's* coming is a coming to a Self that already is as having-been; on the other hand, *Dasein* is what it has been only as long as the future continues to come. We must now turn to temporal nearness, the present. According to Heidegger, the genuine meaning of the present consists in a 'making present' (*Gegenwärtigen*). *Dasein*, as temporalizing, makes things present; this is the essential meaning of the present as it primordially appears to *Dasein*. Anticipating resolve discloses the actual situation of the *Da* in such a way that ek-

sistence, in its action, can be circumspectively concerned with what is factually ready-to-hand in the actual situation, that is, letting that which has environmental presence be encountered, is possible only by *making* such a being *present*.²⁸

The 'making present' of what has presence presupposes, on the one hand, the future as anticipation of *Dasein's* possibilities and, on the other, the return to what has-been. By virtue of *Dasein's* understanding of its own Being, thus, *Dasein* is able to understand the human situation as a whole; at the same time intramundane beings can manifest themselves to it in their belonging to a world. Thus, what Heidegger calls 'making-present' presupposes the 'having been' and the 'future'. The present is as the resultant of the two other ek-stases of time. 'Having been' arises from the 'future' in such a way that the future which has already been releases the present from itself. What is meant by temporality is precisely the unity of this structural whole; the future which makes present in the process of having been. Only insofar as *Dasein* is characterized by temporality can it realize its authentic Being. Thus temporality reveals itself here as the meaning of authentic care.²⁹

From all of this, it becomes clear that *Dasein* can realize its total unity only by temporalizing itself. This 'becoming temporal' includes at the same time future, having-been, and present. These three 'phases' of time imply one another and nonetheless are mutually exclusive. For this reason Heidegger calls them the 'ek-stases' of primordial time. We must now examine the nature of the relations which connect these ek-stases of time with the structural elements of care. According to Heidegger, care must be characterized by ek-sistence (having to be ahead of itself), facticity or thrownness (already being in the world), and fallenness (being absorbed in intramundane things). As basically Being-able-to-be (*Sein-können*), *Dasein* is always ahead of itself, ahead of what it actually is. That is why its understanding has the character of a project. It is precisely because *Dasein* possesses the ontological structure of projecting (*Verstehen*) that it can always be ahead of its actual being. However, being ahead-of-itself, *Dasein* always is already in a world and is of necessity involved in it. Thus, *Dasein* cannot go beyond itself without being 'thrown' into the world. This means that ek-sistence as Being-ahead-of-itself always includes facticity. Finally, *Dasein*, which is in a world into which it has been thrown, always discovers itself there as absorbed by that which immediately manifests itself there and with which it deals concernfully (fallenness). But now the relationship between *Dasein's* essential temporality and care will be clear at once. Heidegger expresses it as follows: "The 'ahead-of-itself' (ek-sistentiality) is grounded in the future. The 'being-already-in' (facticity) makes known the 'having been'. 'Being-at' (fallenness) becomes possible in 'making-present'."³⁰

After showing that the very Being of *Dasein* consists in care whereas

care, in turn, is understood in terms of temporality, Heidegger tries to explain how man's temporality in its modifiability is the principle for the distinction of his possible modes of Being. *Dasein* is essentially temporal; it temporalizes time. If it takes the temporalization of time upon itself, it *is* in an authentic way; however, if it takes itself as a temporal thing which finds itself in a temporal horizon, it is in an inauthentic manner. One has to realize, however, that *Dasein* would not be able to temporalize time authentically, if man did not always find himself already in a temporal openness, somehow connected with his own 'inner-temporality'. In other words, man can ek-sist authentically only if in his historicity he expressly endures his destiny of having to temporalize time as finite, that is as a mortal being. But this means that 'inner-temporality' and historicity are inseparable. When man turns toward historicity, he is able to ek-sist authentically; however, if he turns to his own 'inner-temporality' he forgets himself in his concern for what is ready-to-hand or in his presentation of what is present-at-hand.³¹

Ek-sistence, Being-present-at-hand, and Being-ready-to-hand, thus, are intrinsically connected with man's temporality. But this means that the temporality of *Dasein* is not only the principle for the division of *Dasein's* modes of Being, but the time which is temporalized by *Dasein* is also the principle of the division of the meaning of Being into possible significations of Being (namely Being as ek-sistence, as present-at-hand, as ready-to-hand, etc.). But this means, in turn, that a description of the various interplayings of the three dimensions of temporality can give us a guiding-clue for the division of the significations of Being.³²

We have defined *Dasein's* Being as care and found that the ontological meaning of care is temporality. We have seen, also, that temporality constitutes the disclosedness of *Dasein's there*. Now in the disclosedness of this 'there', the world is disclosed along with it. But this means that world, taken as Total-meaningfulness, must likewise be grounded in temporality. The existential-temporal condition for the possibility of the world lies in the fact that temporality, taken as ek-static unity, has something like a horizon within it. For ek-stases are not simple 'raptures' in which one gets carried away; rather, there belongs to each ek-stasis a kind of 'whither' to which one is carried away. Let us call this whither of the ek-stases the 'horizontal schema'. The schema then in which *Dasein* comes toward itself futurally is the 'for the sake of which'; the schema in which *Dasein* is disclosed to itself in its thrownness is to be taken as that 'in the face of which' it has been thrown and that 'to which' it has been abandoned; this characterizes the horizontal schema of what has been. Finally the horizontal schema for the present is defined by the 'in order to'.

The unity of the horizontal schemata of future, present, and having been, is grounded in the ek-static unity of temporality. The horizon of

temporality as a whole determines that whereupon each ek-sisting being factually is disclosed. With its factual Being-there, a Being-able-to-be is projected in the horizon of the future, its being-already is disclosed in the horizon of having-been, and that with which *Dasein* concerns itself in each case is discovered in the horizon of the present. The horizontal unity of the schemata of these ek-stases connects in a primordial way the relationships of the 'in order to' with the 'for the sake of which' so that on the basis of the horizontal constitution of the ek-static unity of temporality, there belongs to *Dasein* in each case something like a world that has been disclosed. Just as the present (*Gegenwart*) arises in the unity of the temporalizing of temporality out of the future and the having-been, so in the same way the *horizon* of a present temporalizes itself equiprimordially with *those* of the future and the having-been. Thus, insofar as *Dasein* temporalizes itself, a world *is*. In temporalizing itself in regard to its own Being, *Dasein* as temporality is essentially in a world because of the ek-static-horizonal constitution of his temporality. The world, therefore, is not ready-to-hand as a piece of equipment, nor present-at-hand as a thing, but it temporalizes itself in temporality. It is there with the outside-of-itself typical for the ek-stases. If no *Dasein* ek-sists, then no world is 'there' either.

In all forms of concern and in all objectification the world is always already presupposed; for all of these forms are possible only as ways of Being-in-the-world. Having its ground in the horizontal unity of ek-static temporality, the world is transcendent. It is already ek-statically disclosed before any entities-within-the-world can be encountered. Temporality maintains itself ek-statically within the horizons of its own ek-stases and in temporalizing itself it comes back from these ek-stases to those entities which are encountered in the 'there'. Thus the Total-meaningfulness which determines the structure of the world is not a network of forms which a worldless subject lays over some kind of material; *Dasein*, understanding itself and its world ek-statically in the unity of the 'there', rather comes back from these horizons to the entities encountered within them. Coming back to these entities in understanding is the existential meaning of letting them be encountered by making them present.³³

There is finally a relationship between *Dasein*'s spatiality and its temporality. *Dasein* must be considered as temporal and 'also' as spatial coordinately. In clarifying this relationship, Heidegger says, it cannot be our intention to explain *Dasein*'s 'spatio-temporal' character by pointing out that *Dasein* is an entity which is 'in space as well as in time'. Furthermore, since temporality is the very meaning of the Being of care, it will be impossible to 'reduce' temporality to spatiality. On the other hand, to demonstrate that spatiality is existentially possible only through temporality is not tantamount to deducing space from time. What we must aim at is the uncovering of the temporal conditions for the possi-

bility of the spatiality which is characteristic of *Dasein* – a spatiality upon which the uncovering of space within the world is to be founded. When we say that *Dasein* is spatial, we do not mean to say that as a thing *Dasein* is present-at-hand in space. *Dasein* as such does not fill up space, but it rather takes space in, this to be understood in the literal sense. In ek-sisting *Dasein* has already made free for itself a leeway (*Spielraum*). It determines its own position or location by coming back from the space it has made free to the place which it occupies.

When *Dasein* makes room for itself it does so by means of directionality and de-severance (by making distances disappear). How is this possible on the basis of *Dasein*'s temporality? Let us give an example of our everyday concern with things. When *Dasein* makes room for itself and the things with which it is concerned, it has first to discover a region in which it can assign places to the things in question. In so doing it must bring these things close, and situate them in regard to one another and in regard to itself. *Dasein* thus has the character of directionality and de-severance. All of this, however, presupposes the horizon of a world which has already been disclosed. But if this is so, and if it is essential for *Dasein* to be in a mode of fallenness, then it is clear also that only on the basis of its ek-static-horizonal temporality is it possible for *Dasein* to break into space. For the world is not present-at-hand in space and yet only within a world does space let itself be discovered.³⁴

It seems to me that this brief resumé of some of the basic ideas of Heidegger's original conception of time should suffice to explain what Heidegger intends to say in his 1962 lecture. But before turning to the lecture itself I wish first to reflect for a moment upon the intrinsic limitations of his original view of time, particularly with respect to the problem concerning the meaning of Being.

II From *Being and Time* to 'Time and being'³⁵

In Heidegger's view *Being and Time* (1927) was meant to be a 'fundamental ontology' which was to prepare the way for a 'genuine ontology' whose main task it would be to focus on the question concerning the meaning of Being. Fundamental ontology consists substantially in an analytic of *Dasein*'s Being as Being-in-the-world, to be developed by means of a hermeneutic phenomenology. In the first part of the book Heidegger conceives of *Dasein* in terms of care, whereas in the second part care is understood as temporality: The meaning of the Being of *Dasein* is temporality. All of this was to prepare the answer for a more basic question concerning the temporal character (*Zeithaftigkeit*) of the meaning of Being itself. 'In our considerations hitherto, our task has been to interpret the primordial whole of factual *Dasein* with regard to

its possibilities of authentic and inauthentic Being, and to do so in an existential-ontological manner in terms of its very basis. Temporality has manifested itself as this basis and accordingly as the meaning of the Being of care. . . . Nevertheless, our way of exhibiting the constitution of *Dasein's* Being is only one way which we may take. Our aim is to work out the question of Being in general.³⁶ In other words, once temporality is laid bare as the meaning of *Dasein's* Being, the decisive step is still to be taken: The step namely which leads from this kind of temporality to the temporality characteristic of the meaning of Being. This last step is not taken in *Being and Time*. Heidegger published the book in an incomplete form and in the last sentences of it pointed to the work that in his view remains to be done: 'The existential-ontological constitution of *Dasein's* totality is grounded in temporality. Hence the ek-static projection of Being must be made possible by some primordial way in which ek-static temporality temporalizes. How is this mode of temporalizing temporality to be interpreted? Is there a way which leads from primordial time to the meaning of Being? Does time itself manifest itself as the horizon of Being?'³⁷

By publishing the book in an incomplete form in 1927 Heidegger admitted that he had not completely succeeded in the task he had set for himself. The basic question he encountered was the following: Once the temporality of *Dasein* is grasped in the unity of its three ek-stases, how can this temporality of *Dasein* be interpreted as the temporality of the understanding of Being and how is the latter, in turn, related to the meaning of Being? Originally Heidegger thought he had found a way to answer this question, but it appeared almost immediately that that way led away from what he really wished to accomplish, namely to show that time is the transcendental horizon of the question of Being.³⁸ For on the basis of the analyses as they are actually found in *Being and Time* it is still not yet clear precisely what is to be understood by 'transcendence' taken as the overcoming of beings in the direction of Being. In addition there is the question of the exact relationship between *Dasein's* temporality and time as the transcendental horizon for the question concerning the meaning of Being. Exactly what is meant here by 'transcendental'? This much is clear: The term 'transcendental' does not mean the objectivity of an object of experience as constituted by consciousness (Kant, Husserl), but rather refers to the project-domain for the determination of Being as seen from the viewpoint of *Dasein's there*.³⁹ But even in this supposition it is still not yet clear what the precise relationship is between the temporality of *Dasein* and time as the transcendental horizon for the question of Being, because it is not clear how *Dasein's* understanding of Being is to be related to the meaning of Being. Heidegger says that meaning is that in which the intelligibility of something maintains itself.⁴⁰ The meaning of Being then is that in which the intelligibility of Being

maintains itself. But what is the precise relationship between Being's intelligibility and *Dasein's* understanding of Being? In the introduction to the second part of the book Heidegger argues that 'to lay bare the horizon within which something like Being in general becomes intelligible, is tantamount to clarifying the possibility of having any understanding of Being at all – an understanding which itself belongs to the constitution of the being called *Dasein*'.⁴¹ But precisely what is meant by 'being tantamount to'? If one takes this statement literally, it means that *Dasein* has an absolute priority over the meaning of Being and then relativism seems to be the final outcome of the investigation. Heidegger saw this danger and it took him a number of years to find a way to avoid it without being forced into a position of having to appeal to a 'God of the philosophers', regardless of the concrete form in which this 'God' might be proposed.

There are a number of other issues which did not receive *final* answers in *Being and Time*, problems such as the idea of phenomenology, the relationship between ontology and science, the relationship between time and space, a further determination of *logos*, the relationship between language and Being, the relationship between Being and truth, etc.⁴² But rather than focusing on any one of these, let us turn our attention again to the problem concerning the relationship between *Dasein's* temporality and time as the transcendental horizon for the question of Being, and this time from a slightly different point of view.

In *Being and Time* Heidegger was guided by the idea that in the ontological tradition Being was understood mainly as presence-at-hand⁴³ as continuous presence, and thus from one of the dimensions of time, namely the present. Heidegger wished to bring the onesidedly accentuated 'continuous presence' back into the full, pluridimensional time, in order then to try to understand the meaning of Being from the originally experienced time, namely temporality. In his attempt to materialize this goal, he was guided by a second basic idea, namely that each being can become manifest with regard to its Being in many ways, so that one has to ask the questions of just what is the pervasive, simple, unified determination of Being that permeates all of its multiple meanings. But this question raises others: What, then, does Being mean? To what extent (why and how) does the Being of beings unfold in various modes? How can these various modes be brought into a comprehensible harmony? Whence does Being as such (not merely being as being) receive its ultimate determination?⁴⁴

Heidegger had studied some of these modes of Being in the interpretative analyses of *Being and Time*, and thus, at the very end of the book, found himself led to consider the question of whether or not there is a basic meaning of Being from which all other meanings can be derived by *taking time* (understood as temporality) as a *guiding clue*. In view of

the fact that man's understanding is intrinsically historical, the further question must be asked of whether man's understanding of Being's meaning is intrinsically historical, also, or whether the understanding of Being can perhaps in some sense have a 'supra-temporal' character. In *Being and Time* Heidegger was unable to answer the first question adequately because he had not been able to find a satisfactory solution for the second. For upon closer consideration his conception of historicity as found in *Being and Time* seems to be ambiguous. Historicity is described in the book first as the genuine temporalization of time and the principle of the distinction between *Dasein's* modes of Being, and then later it is said that historicity is the medium in which all ontological understanding must maintain itself.⁴⁵ It does not seem to be possible to defend both theses simultaneously; and even if there should be a position from which one could defend both, even then it would still not be clear in what sense the meaning of Being itself is affected by historicity.

In the decade following the publication of *Being and Time* Heidegger eliminated part of the initial ambiguity by first examining more carefully how different significations of Being become differentiated in the fundamental meaning of Being and how temporality, indeed, is the principle of these distinctions. In so doing, he could maintain his original view that the meaning of Being is the 'Ground' in which all significations of Being are to be grounded and from which all understanding of Being nourishes itself. On the other hand, however, the meaning of Being cannot be understood in terms of an eternal standard being ('the God of the philosophers'); rather it must be conceived of as an abysmal, groundless 'ground'. For the *fact* that Being comes-to-pass in the way it does, and for the *fact* that an understanding of Being emerges in the way we actually find it, no one can indicate a ground, because each process of grounding already presupposes the meaning of Being. When the meaning of Being lets a determinate signification of Being become the standard signification, then it 'groundlessly' bars other significations and even itself *as* the ground of the manifold possible other significations. It is in this sense that Being shows and hides itself at the same time and why the meaning of Being is to be called 'truth', unconcealment, whose coming-to-pass is and remains a mystery and whose 'happening' is historical in a sense which cannot be understood on the basis of what we usually call history.

Furthermore, the world taken as the building-structure of the truth of Being is that organized structure which is stratified in many ways and is constructed according to the manner in which time temporalizes itself. This temporalization of time itself is historical and thus the stratification of the organized structure of Being's truth is historical, too; as such it can be distinguished in various epochs. In each epoch we find in the world as the building-structure of the truth of Being manifold organized

and systematized 'layers' of meaning all of which refer to basic forms of 'experience' between which there is a tension, and concerning which it is difficult to see how they can all belong together. Heidegger's main concern is to explain how in a certain epoch (particularly our own) all these 'layers' can belong together in a whole, the world, and how in this world as the building-structure of Being's truth for this particular era the 'courses of Being are already traced out' and how therefore Being can encounter us in these particular, different ways, and not in others; thus how in this world Being itself shows and hides itself at the same time.⁴⁶

But between 1927 and 1962 Heidegger never explicitly returned to the main question underlying the basic idea which directed all of these investigations: The nature of time. It is obvious that the conception of time as temporality, found in *Being and Time*, is not adequate to account for all of this. Whereas in *Being and Time*, where Being and time are concerned, the priority is attributed to man, in the later works the privileged position is given to Being. If the original relationship between Being and time is to be maintained, then it would seem logical to attribute a privileged position to time in the coming-to-pass of truth, also. But if both Being as well as time do not depend upon man in the final analysis, do they then perhaps refer to 'something' else which precedes them in some sense? This is indeed the main theme of the Time-lecture which we shall now consider.

III 'Time and being' (1962)

The 'Zeit und Sein' lecture begins with a short preface in which Heidegger explains that he intends to say something about the attempt 'which thinks Being without any reference to a foundation of Being from the side of beings'.⁴⁷ In other words, in this lecture there will be no reference to a *summum ens* taken as *causa sui* which could be conceived of as the foundation of all that is; nor is Being to be understood here within the perspective of the metaphysical interpretation of the ontological difference, according to which Being is thought of merely for the sake of beings.⁴⁸ Heidegger believed such an attempt to be necessary for at least two reasons. First of all, without such an attempt it will be impossible to bring to light in a genuine way the Being of all that which we today encounter in the world as beings and which are fundamentally determined by the essence of technique (*Ge-stell*).⁴⁹ Secondly such an attempt is necessary if one is adequately to determine the relationship between man and that which until now has been called 'Being'.⁵⁰

Many people believe that philosophy should be oriented toward 'world-wisdom'. According to Heidegger, philosophy today finds itself in a position in which it must stay away from useful 'life-wisdom', and must

abandon immediate understanding, because a form of thought has become necessary from which everything that makes up the world in which we live receives its determination (works of art, complicated physical theories, technical instruments, computers, etc.)⁵¹

What is contained in the lecture to follow, Heidegger says, is no more than an attempt and a venture. The venture consists in the fact that the essay is formulated in propositions whereas its theme is such that this way of 'saying' is incongruous. What is important in the essay, therefore, is not so much the propositions of which it consists, but rather that to which the questions and answers by means of which Heidegger tried to approach that theme, point (*zeigen*). These questions and answers presuppose an experience of 'the thing itself', and it is for this experience on the part of the reader that Heidegger's essay tries to prepare.⁵²

1 *Being and time*

The first part of the essay deals with the relationship between Being and time. These two themes are mentioned together here because, from the very origin of Western thought, Being has been interpreted as Being-present (*Anwesen*), while Being-present and Presence (*Anwesenheit*) refer to the present (*Gegenwart*) which, in turn, together with the past and the future constitute what is characteristic of time. Thus as Being-present Being is determined by time. But in how far is Being determined by time? Why, in what way, and from what is it that time re-sounds in Being? It is obvious that any attempt to think about this relationship with the help of our everyday conceptions of Being and time is doomed to failure.

In our everyday life we say that things are in time; or also that they have their time. This way of speaking, however, does not apply to Being, for Being is not a thing. And since Being is not a thing it is not in time either. And yet Being is determined by time. On the other hand, what is in time we call the temporal. The temporal refers to what elapses with time. Thus time itself elapses; but while elapsing continuously, time nevertheless remains as time. Now 'to remain' means 'not to perish', and thus 'Being-present'. But this means that time is determined by a kind of Being. But how then can Being be determined by time? We must, therefore, come to the conclusion that Being is not a thing and thus not something temporal, although as Being-present it is determined by time. And on the other hand, time is not a thing and thus not something-which-is, and yet in elapsing it permanently remains, without it itself being something temporal. Therefore, Being and time determine one another in such a way that Being is not something temporal and time is not something-which-is.

By adopting Hegel's dialectic approach one could try to overcome these contradicting statements by transcending Being and time toward a

higher and more encompassing unity. But such an approach would certainly lead away from the 'things themselves' and their mutual relations; for such a procedure would certainly no longer deal with time as such nor with Being as such, nor with their mutual relationship. The genuine problem with which we are confronted here seems precisely to consist in the question of whether the relationship between Being and time is a relationship which results from a certain combination of Being and time, or whether perhaps this relationship itself is primary, so that Being and time result from it. In order to find an answer for this question we must try to think circumspectly about these 'things themselves', that is about Being and time, which are perhaps the two main themes of thought. The labels 'Being and time' and 'Time and being' refer to the relationship between these two themes, to that which keeps these two themes together. To reflect circumspectly upon this relationship is *the* theme of thought.⁵³

Being is a theme of thought, but it is not a thing; time is also a theme of thought, but it is nothing temporal. Of a thing we say: It is. With respect to Being and time we are more careful; here we say: There is Being, and there is time.⁵⁴ 'There is', this English expression stands for the German '*Es gibt*'. This can be understood to mean: 'It gives' in the sense of 'there is something which grants'.⁵⁵ If we follow this suggestion then the question is one of what this 'It' is which grants Being and time. And also: What is Being which is granted here? What is time which is given here? Let us first try to think about Being in order to grasp it in what is characteristic of it.

Being which marks each being as such means Being-present (*Anwesen*). In regard to that which is present, Being-present can be conceived of as letting-something-be-present. It is on this letting-be-present that we must focus our attention here. It is characteristic for this letting-be-present that it brings something into unconcealment. Letting-be-present means to unveil, to bring into the open. In the process of unveiling there is a kind of granting at work which grants Being-present, while it lets-be-present that which is present, namely beings. In this process we come again upon a granting, and thus upon an 'It' which grants.⁵⁶ We do not yet know precisely what this granting means, nor do we know what this 'It' refers to. One thing is clear, however. If one wishes to think about what is characteristic of Being as such, he must abandon the attempt to understand Being from the viewpoint of beings, to conceive of Being as the ground of beings. On the contrary, he must focus his attention on this typical granting and that mysterious 'It' which grants. Being somehow belongs to this granting; it is the gift of the 'It' which grants. Being is not something which is found outside the granting, as is the case with a common gift. In the granting Being as Being-present becomes changed. As letting-be-present it belongs to the unveiling itself, and as gift it

remains contained in the granting. For Being is not. Being as the unveiling of Being-present is granted by a mysterious 'It'.⁵⁷

Heidegger is of the opinion that the meaning of this 'It grants Being' can be explained in a clearer way by means of a careful reflection on the various changes which have taken place in what has been called 'Being'. As we have mentioned, since the origin of Western thought in Greece, Being has been referred to as Being-present. And even today, in the era of modern technique, Being is still pointed to as Being-present, namely as Being-present in its availability on which one can continuously count (*Ge-stell*). The fact that Being must be referred to as Being-present manifests itself in an analysis of what is ready-to-hand and present-at-hand. We find the same thing back when we reflect on the meaning of *Hen*, *Logos*, *Idea*, *ousia*, *energeia*, *substantia*, *actualitas*, *perceptio*, *monad*, objectivity, Reason, Love, Spirit, Power, Will-to-will in the eternal return of the same.

The unfolding of the fullness which shows itself in these changes manifests itself at first sight as a history of Being. However, Being has no history in the way a city or a nation has its history. The history-like character of the history of Being is determined only and exclusively from the way Being comes-to-pass, that is from the way in which 'It' grants Being.⁵⁸

Now from the very beginning people have reflected on Being, but no one has ever thought about the 'It' which grants Being. This 'It grants' withdraws in favor of that which it grants, namely Being. And Being itself, in turn, was almost immediately thought of in terms of beings, that is in its relationship to beings.

According to Heidegger, the kind of granting which grants only its gift but which itself withdraws should be called 'sending' (*Schicken*). This becomes immediately clear when one compares the case in which someone gives someone else a present with the case in which he sends it to him. Viewing it from this perspective, one may say that Being which is granted is that which has been sent and which (as sent) remains in each one of the modifications which we find in history. Thus, the historical character of the history of Being must be determined from that which is characteristic of this sending, and not from an undetermined coming-to-pass.

History of Being, therefore, means mittence of Being. And in the various ways of sending, the sending itself as well as that mysterious 'It' which sends, hold themselves back in the various manifestations in which Being shows itself. To hold oneself back means in Greek *epochē*. That is why we speak of epochs of Being's mittence. Epoch does not mean, therefore, a certain period of time in the happening, but the basic characteristic of the sending itself, that is to say this holding-itself-back in favor of the various manifestations of the gift, namely Being with

respect to the discovery of beings. The sequence of the epochs in Being's sending is neither arbitrary nor can it be predicted with necessity. And yet what is co-mitted manifests itself in the mittence also, just as well as that-which-belongs-to manifests itself in the belonging-together of the epochs. These epochs overlap in their sequence so that the original mittence of Being as Presence is more and more concealed in the various modifications of the unveiling. Only the 'demolition' of these concealments (destruction) will grant to thought a provisional insight into what then manifests itself as the mittence of Being.

When Plato represents Being as *Idea*, when Aristotle represents it as *energeia*, Kant as positing, Hegel as absolute Concept, and Nietzsche as Will to power, then these are doctrines which are not just accidentally brought forth. They are rather the 'words' of Being itself as answers to an address which speaks in the sending but which hides itself therein, that is to say in that mysterious 'It grants Being'. Each time contained in a mittence which withdraws itself, Being is unconcealed for thought in its epochal variational fullness. Thought remains bound to the tradition of these epochs of Being's mittence. This is true also, and particularly so, when thought reflects upon the question of how and from what Being itself receives the determinations which each time are characteristic of it, namely from this mysterious 'It grants Being'. For this granting manifests itself as mittence.

But how are we to conceive of this 'It' which grants Being? From the preceding pages as well as from the title of this essay, Heidegger says, one might expect that this is to be found in time.⁵⁹

Briefly summarizing this part of the lecture, we may say that Heidegger for the greater part repeats his view of Being as contained in *Letter on Humanism* (1947) and later works. Just as in *Letter on Humanism*, Heidegger states here that the basic conception of *Being and Time* is to be maintained in this new perspective, although he warns explicitly that we should not confuse *Dasein*'s historicity with the 'historicity' of Being itself. Finally, in this part of the lecture many references are made to the aboriginal Event (*Ereignis*) under the guise of that mysterious 'It' which grants. Heidegger is to return to this in the last part of the lecture. But let us first look at his view on time.

We all know what time is and just as was the case with Being we have a common sense conception of it. It will be clear once again that this common sense conception is of no help here. We do not yet know what is characteristic of time as such. We have just seen that what characterizes Being, that is to say that to which it belongs and in which it remains contained, manifests itself in that mysterious 'It grants'. That which is characteristic of Being is not something being-like (*Seinsartiges*). Trying to understand what Being is, we are led away from Being toward the mittence which grants Being as a gift. We may expect that the same

thing will be true for time and that is why our common sense conception will be of no avail here, either. And yet the titles 'Being and time' and 'Time and being' suggest that we try to understand what is characteristic of time, the moment we try to understand what is characteristic of Being. For, as we have seen, Being means Being-present, letting-something-be present, Presence.

Presence is not the present, although the former almost immediately leads to the latter. Present (*Gegenwart*) suggests past and future, the earlier and the later in regard to the 'now'. Usually time is described in terms of the 'now', assuming that time itself is the 'sum' of present, past, and future. We seldom think of time in terms of Presence. The conception of time in terms of the 'now', as a series of 'nows' which succeed one another, of a one-dimensional continuum, was suggested by Aristotle and has since been defended by many thinkers. It is this time which we refer to when we measure time, when a 'temporal interval' is to be measured.⁶⁰

But obviously all of this does not answer the question of precisely what time is. Is time and does time have a place? Time is obviously not *nothing*. If we wish to express ourselves more carefully, we should say here again: There is time (*Es gibt Zeit*). Time must be understood from the 'present' and this must not be taken as 'now' but as Presence.

But what is to be understood by Presence (*Anwesenheit*)? Presence is that which determines Being as letting-be-present and revealing. But what kind of thing is this? In *Anwesen* (Being-present) we find *wesen* and *wesen* means *währen* (to last, to continue). But by realizing this we much too often jump immediately from *währen* to *dauern* (to last, to endure); this duration, in turn, conceived of in the light of our common sense conception of time, is mostly understood as an interval between one 'now' and another one. However, our speaking about *An-wesen* demands that we become aware of a staying and lingering (*weilen*) and dwelling (*verweilen*) in this *währen* as *Anwähren* (continuous lasting). This *An-wesen* concerns us men. But who are we? In trying to answer the question we must again proceed carefully; for it could very well be the case that man is to be defined in terms of what we are trying to reflect on; man himself is affected by the Presence while this 'goes on' and it is because of this that he himself can be present to all that is present and absent. Man stands in that which thus goes on (*Angang*) and in which Presence takes place; it is man who receives the Presence which that mysterious 'It' grants as a gift, while he learns what appears in the letting-be-present. If this were not so, man would not be man.⁶¹

It seems that by talking about man, we have lost the way, Heidegger says; for we are trying to determine what is characteristic of time. In some sense this may be true, and yet we are closer to what we are looking for than it may seem at first sight. Presence means: The continuous

lingering-dwelling (*verweilen*) which concerns man, reaches him, and is granted to him. But from where does this granting reaching come? We must realize here, Heidegger continues: 1) that man is always concerned with the presence of something which is present, and that he never immediately heeds the Presence itself; 2) that which is no longer present still concerns man and as such it is still present to him; in what has been, Presence is still granted in some sense; 3) that which is not yet presented is present in the sense that it approaches man; in that which approaches man, Presence is already granted to him. From this it follows that Presence does not always have the character of the present.

But how are we to determine this granting of the Presence in the present, past, and future? Does this granting consist in the fact that it reaches us, or does it reach us because it is in itself a granting? There is no doubt that the future grants and adduces the past, whereas the past grants the future. And this mutual granting gives the present at the same time. In this way we attribute a temporal character to this mutual granting. And thus it is not right to call the unity of this mutual granting time, for time is not something temporal; nor can we say that present, past, and future are there 'at the same time'. And yet their mutual granting of one another to each other belongs together in a unity. This unity which unites them must be determined from what is characteristic of them, namely from the fact that they grant one another to each other. But what is it that they grant to each other? Themselves, that is to say the Presence which is granted in them. That which comes to light in the mutual granting of one another to each other of present, past, and future is the Open, or also the time-space. This time-space precedes what we commonly call space and time. It is a three-dimensional Open in that it comes to light by means of a three-fold granting of present, past, and future.⁶²

But from what are we to determine the unity of the three dimensions of this time-space? We know already that a Presence is at work in the coming of what is not-yet-present as well as in the having-been of what is no-longer-present, and in what we usually call the present. This Presence does not belong to one of these three dimensions to the exclusion of the others. While the three dimensions give themselves over to one another and precisely in this passing of the one to the other (*Zuspiel*) still another granting manifests itself which opens up a fourth dimension. It is this latter granting which is characteristic of time itself and which brings about the Presence which is typical in each case for the coming, the having-been, and the present. It keeps these latter dimensions separated, and nevertheless it keeps them in each other's proximity, also, so that these three dimensions can remain close to one another. This is why one can call the primordial granting in which literally everything begins (*anfängt*) and in which the unity of genuine time precisely consists, a

proximity which brings near (*nahernde Nähe*). It brings close to one another the coming, the having-been, and the present by keeping them apart. For it keeps open the having-been by denying it its coming as present, just as it keeps open the coming by withholding the present in this coming, that is by denying it its being present. Thus the proximity which brings near has the character of a denial and withholding.⁶³

Time *is* not. 'It' gives time. The granting which gives time is to be determined from the proximity which denies and withholds. 'It' grants the Open of time-space and guards that which is denied in the having-been and that which is withheld in the coming. This granting thus is revealing and concealing at the same time; while granting the Open of time-space it hides itself as granting.

But where now is this mysterious 'It' which grants time and time-space? Obviously this question is not correctly formulated, for time has no place, no 'where'. Time is that pre-spatial 'place' which makes each 'where' precisely possible. Since the beginning of Western thought, people have asked this question and many of them have said with Aristotle and Augustine that 'time is in the soul'. Thus, time cannot be without man. The question, however, is one of whether or not it is man who gives time, or whether it is man to whom time is granted. In the latter case the question still remains of who or what 'It' is which gives time. One thing is clear, however, man is what he is only and exclusively because he stands within the three-fold granting and 'endures' the proximity which denies and withholds, and determines this granting. Man does not make time, and time does not make man. Expressions such as 'making', 'producing', and 'creating' do not make sense here.⁶⁴

Notwithstanding the great differences, the preceding passage on time undeniably is strongly reminiscent of what was said in *Being and Time* about the 'horizontal schemata' and spatio-temporality. It seems to me that the last paragraph of the Time-lecture which we have just considered refers to these sections of *Being and Time* and reminds us that the perspective of *Being and Time* is and remains pre-understood in the current reflections on time. *Dasein* plays an essential part in the coming-to-pass of Being as well as in the coming-to-pass of time as the transcendental horizon of Being. It is clear by now, however, that in this complex process *Dasein* is not the one who grants, but rather the one to whom all of this is given. But this still entails that without *Dasein* the granting would not have taken place. In that sense it remains true that if no *Dasein* ek-sists, then no world is 'there' either. On the other hand, if it is true that *Dasein* does not have the priority in the coming-to-pass of Being and time, then all that which *Being and Time* tried to describe from *Dasein*'s point of view, must now be described from the viewpoint of that mysterious 'It' which grants Being as well as time. Where, in *Being and Time*, the horizontal schemata were understood as that which

Dasein's understanding projects, it is now said that 'It' gives time in such a way that in time the ek-stases grant one another to each other. In other words, where in *Being and Time* the ek-stases were determined by the 'for the sake of which', the 'in the face of', and the 'in order to' of *Dasein's* projecting, they are determined now by the Open which is granted by the 'It' while the three dimensions give themselves over to one another.

2 'It' grants *Being and time*

We have seen that we must say: There is something which grants Being as well as time. But what now is this 'It'? In answering this question, Heidegger suggests, we must not think of this 'It' as a 'power' or a 'God'. We must try to determine it from Being as Presence and from time as the transcendental domain in which the clearing of the multiform Presence is granted.

The granting which is found in 'It grants Being' manifests itself as a mittance of Presence in its epochal transformations, whereas in the expression 'It grants time', it appears as a lighting presenting of a four-dimensional domain, the Open, time-space. Taking into consideration that in Being as Presence time manifests itself, one could expect that genuine time, the four-fold granting of the Open, constitutes that mysterious 'It' which grants Being as Presence. Genuine time would then be the 'It' we have in mind when we say 'It grants Being'. The mittance in which Being is granted, would then consist in the granting of time. But is it really true that time is that mysterious 'It' which grants being? By no means, for time itself, too, is the gift of an 'It grants'. Thus this mysterious 'It' is still undetermined.⁶⁵

Heidegger points out that perhaps we find ourselves in a very difficult situation here in that we have to use sentences of Indogermanic languages which do not have a clear theory about 'impersonal propositions'. He invites the reader, therefore, not to pay too much attention to the propositions, but rather to the 'thing itself' to which they refer. What is meant by the 'It' must be determined from that granting-process which belongs to it, that is the granting which at the same time is mittance (*Geschick*) and lighting presenting (*lichtendes Reichen*).

In the mittance of Being and the presenting of time there manifests itself an ap-appropriation making Being as Presence and time as the Open that which they properly are. That which makes both, namely Being and time, what they properly are (*Eigenes*) and makes them belong together, is what Heidegger calls *Ereignis*, aboriginal and ap-appropriating Event. The *Ereignis* makes Being and time belong together and brings both to what they properly speaking are. In other words, that mysterious 'It' about which we have spoken is the *Ereignis*. And this *Ereignis* is ontologically prior to Being as well as to time, because it is that which grants

to both what they properly are. – This expression is correct and yet it is not completely true, because it hides the original relationship between Being, time, and the Event.

But what then is this ap-propriating Event? Before trying to answer this question we must point once again to two difficulties connected with this question. We have already seen that this typical Event is such that it cannot be captured in a proposition. Furthermore, in asking the question: What is this ap-propriating Event we ask about the quiddity (*Was-sein*), the essence, the mode of Being, the way in which the Event abides and is present. But this presupposes that we already know what Being is and how Being is to be determined from the viewpoint of time. We have already seen that the mittance of Being rests on the revealing-concealing presenting of the pluriform Presence in the Open domain of time-space. But this presenting as well as that sending belong within the Event, and thus cannot be presupposed in the determination of the Event.⁶⁶

That is why it is perhaps better to say first what Event does not mean. The word 'event' does not have its common meaning here. It usually means occurrence, whereas in this case it means the ap-propriation taken as a presenting and sending. In other words, whereas it does not make sense to speak about the occurrence of Being, it does make sense to speak about Being as Event.

In the past people have tried to conceive of Being as *Idea*, *actualitas*, Will, and so on. One could think that Heidegger is suggesting here that it is now time to think of Being as Event. That this is not so becomes clear the moment one realizes that any attempt to understand Event as a modifying interpretation of Being is tantamount to trying to understand Being in terms of a typical kind of being, namely an event. One might proceed here along the following lines. Until now we have tried to think about Being in terms of Presence and letting-be-present in its relation to the showing-and-hiding presenting of genuine time. In this way it became clear that Being belongs to the Event. Thus it is from the Event that the granting as well as its gift (Being) must be determined. In this case one could say that Being is a kind of Event, but Event is not a kind of Being. Such a solution of the problem, however, is too cheap in that it hides the original relationship. Event is not a *summum genus* under which one must distinguish Being as well as time. As we have seen, Being has manifested itself as the gift of the mittance of Presence which is granted through the presenting of time. As such Being remains a property (*Eigentum*) of the ap-propriating Event; Being vanishes in the Event. And the same is true for time. In the ap-propriating Event, Being as letting-be-present is sent just as time is presented there. In the Event, Being as well as time are ap-propriated (*ereignet im Ereignis*).

But what about the Event itself? Is there anything more we can say about it?

Heidegger is of the opinion that, indeed, one could say more about it. In the preceding pages we came across expressions such as 'denying', 'withdrawing', 'withholding', etc., which made it clear that a certain 'withdrawal' (*Entzug*) is characteristic of the aboriginal Event. This clue can and should be followed up in greater detail. But Heidegger refrains from doing so for purely practical reasons.⁶⁷ He concludes the Time-lecture with a few general remarks on certain characteristics of the Event.

We have seen that the sending in the mittence of Being was determined as a granting; that which grants was said to hold to itself, to adhere to itself, to withhold itself; it withdraws from the revealment. A similar statement was made in regard to the presenting characteristic of time. But if it is true that the Event withdraws from revealment we may say that the Event ex-propriates itself from itself and that a certain ex-propriation is characteristic for the ap-propriating Event. This does not mean that the Event gives up itself, but precisely that it preserves its own property.

We have seen, also, that in Being as Presence there manifests itself a process which is going-on and which concerns us men in such a way that the vital characteristic of our humanity is to be found in becoming aware of this procedure and thus taking it over. But this acceptance of Presence's going-on rests on the fact that we stand in the domain of presenting which the four-dimensional time has passed on to us.

Insofar as Being and time are found only and exclusively in the ap-propriation (*das Ereignen*) there belongs to this as a characteristic the fact that it brings man who receives Being to that which is characteristic of him as he stands within the domain of genuine time. This belonging-to rests on the complete ap-propriation characteristic of the ap-propriating Event. It is this complete ap-propriation which lets man enter this Event. This is why we cannot conceive of the Event as something opposite to us or as something which encompasses everything. Representational thought has as little access to the Event as does a speaking in propositions.

Finally, by going from Being to the mittence of Being and from time to the presenting of time-space we have gained some access to the Event. It is of importance, however, to repeat once again: The Event is not a thing. The Event *is* not, nor is there something which gives the Event. The only thing we can say is: *das Ereignis ereignet*. This tautology points to what hides itself in truth as *a-letheia*.⁶⁸

IV Conclusion

We must now return to the main question Heidegger left unanswered in *Being and Time*. There can be no doubt that his thought has made considerable progress since 1927. Part of this development was already evident in *Letter on Humanism* (1947), where the priority in the coming-to-pass of truth is given to Being and a historicity is attributed to Being itself which is distinguished from, and independent of, *Dasein's* temporality and historicity. In other words, it is stated in *Letter on Humanism* that the historicity of the understanding of Being is not identical with Being's own historicity. In this and other works of the same period it was not yet clear how Heidegger believed he would be able to avoid relativism once the finitude and historicity of the Being-process is explicitly recognized and admitted. In this regard in *Letter on Humanism* Heidegger seems to adopt the following point of view.⁶⁹ The thinking of Being thinks Being as this grants itself in mittences. The various mittences taken together constitute Being's history. 'That is why thought which thinks upon the truth of Being is as thought historical.'⁷⁰ When a foundational thinker thinks the mittences of Being and formulates this in words, then his thought is historical. When he retrieves the thought of an earlier foundational thinker then his thought is historical in a second sense, but both these senses are complementary; in both cases Being comes (future) to the thinker as having-been in what is (past) and is made manifest (present) through the articulation of words. That is why the fundamental structure of thought is that of recollection.⁷¹ All thinkers then are engaged in the identical task, namely to think the mittences of Being, but each one accomplishes this in a different way. That is why there is no real progress in foundational thought.⁷² That the coming-to-pass of Truth in foundational thought leads to different expressions is connected with the fact that Being discloses itself while partly hiding itself. From this it follows that each expression is equally meaningful provided it understands itself *as* historical. Refutation in foundational thought is absurd.⁷³ Heidegger himself is aware of the danger of relativism which remains present in this view, also. He believes that one can overcome this danger by realizing that relativism makes sense only within a subject-object opposition. Once it is realized that the truth of an object is not to be considered as relative to a subject, relativism loses its meaning.⁷⁴ But this does not answer the question adequately, and the danger of relativism was not yet completely overcome in 1947. For there can be no doubt that Heidegger does not admit an absolute truth in the sense that there is a truth which is 'eternal' or 'praeter-historical'. Furthermore, in his view there is no necessary link between the various epochs of Being's history. 'The epochs never permit themselves to be derived from one another and, indeed, to be reduced to the sequence

of a consecutive process.' On the other hand, there is a relationship between the epochs in that each later epoch comes 'out of the concealment of the mittance'.⁷⁵

When later in *Vorträge und Aufsätze* (1954) and *Identität und Differenz* (1957) the ambiguity of the *Ereignis* conception as found in *Brief über den Humanismus* is removed, Heidegger was in a position to sharpen his position in regard to the question of relativism. It seems to me that it is one of the main contributions of the Time-lecture that it makes this later view explicit. Heidegger emphasizes once again the finitude of man, the finitude of man's comprehension of Being, the finitude of the coming-to-pass of truth, that is the finitude of the *Ereignis* itself. And yet he asks the question of whether a contemplative turning toward the *Ereignis* could perhaps lead to the end of Being's history. Heidegger says that the experience for which the lecture tried to prepare the reader, does not lead to an identification of Being and thought (Hegel), and yet in some sense this experience does lead to the end of the history of metaphysics. True, the *Ereignis* contains possibilities of unveiling which thought cannot yet distinguish and even less can push aside as irrelevant; thus the contemplative turning toward the *Ereignis* cannot 'stop' future mittences. But could it perhaps be that after the experience has been lived in that contemplative turning toward the *Ereignis* one can no longer speak of Being's history. Before the experience is lived thought remains either within one of the epochs (relativism), or it tries to transcend this epoch by appealing to the 'God of the philosophers' or another absolute. However, once this experience is lived one can understand each mittance as one possible mittance in which the *Ereignis* itself withdraws.⁷⁶

Heidegger returns to this issue in the question concerning the meaning of the term 'change' as found in the lecture in the expression *Wandlungsfülle des Seins*. From within classical metaphysics this means the changing forms of expressions in which Being shows itself historically in each epoch. Then the question is: By what is the sequence of the various epochs determined? Or, from where is this sequence determined? Why is the sequence the way it actually is? Hegel thought that the sequence is determined by a necessity which at the same time is the highest freedom. Heidegger believes that *on this level* one cannot ask and answer this question. One can only say here that the history of Being is the way it is. This 'that' is the only datum which, for thought, is to be accepted inevitably and thus 'with necessity'. One can even indicate then a certain regularity in the sequence and (for instance) claim that the sequence is 'guided' by an increasing forgottenness of Being.⁷⁷

From the viewpoint of the Time-lecture, however, that is to say from the viewpoint of the *experience* for which it tries to prepare us, the term has a different meaning. In the lecture it is said that Being is changed into *Ereignis*. On that level, the expression does not point to the various

manifestations of Being which follow one another, but to the fact that Being (with all its possible, epochal manifestations) is taken back into the *Ereignis*. In other words, if the philosopher looks at the *Wandlungsfülle des Seins* as has always been done in classical metaphysics, then this fullness falls apart in epochs which are no longer related to one another in a way that can be justified with necessity. One can bring a unity to the multiplicity only by introducing the 'God of the philosophers' as the one who gives the series a goal, or eventually who constitutes this goal. One can bring a kind of unity to this multiplicity by setting up a law or rule which somehow justifies the sequence of the epochs, one similar to that suggested by Heidegger. But underlying this way of looking at things there is the classical conception of time which conceives of time in terms of isolated 'now'-moments which as such do not necessarily belong together.

However, if the philosopher looks at this 'fullness' from the viewpoint which Heidegger tries to suggest in this lecture, then the unity of the multiplicity is never broken. The question then is not how this particular and isolated epoch could ever change into another isolated epoch, but how the Being process as a whole 'changes' into the Event in which future and past are held together in the Presence. For in this case one understands, or perhaps more accurately stated, *experiences* that the various epochs are no longer mysteries, but are the necessary consequence of the inherent finitude of an aboriginal Event which presents the Open and grants Being, and in so doing withdraws in favor of this domain and its gift.

The ekstatico-horizional constitution of temporality

Françoise Dastur

The title of this paper is borrowed from *The Fundamental Problems of Phenomenology*.¹ In the name of this title, I would like to raise some questions concerning the meaning and role of the concept of horizon in the Heideggerian thinking between 1926 and 1928, i.e. during the years immediately preceding and following the publication of *Being and Time* in February 1927.² For it is precisely on this subject that the lecture course from the Summer semester 1927 gives us explanations that were not forthcoming in *Being and Time*. In spite of the fact that the complete title of the first part of *Being and Time* – the second part was never published – runs: ‘The interpretation of Dasein in terms of temporality and the explication of time as the transcendental horizon for the question of Being’, the last sentence of the second section – i.e. the last sentence of the text published in 1927 – still assumes the form of a question: ‘Is there a way which leads from primordial *time* to the meaning of *Being*? Does *time* itself manifest itself as the horizon of *Being*?’³ The explication of time as the transcendental horizon for the question of Being should have constituted, in fact, the theme of the third section, under the title ‘Time and being’, as it is indicated in the plan of the book presented in section 8.⁴ A marginal note in Heidegger’s own copy (the famous *Hüttenexemplar*), a marginal note which is reproduced in the text published in 1977 in the *Gesamtausgabe*, refers the reader to the Marburg lecture course of the Summer semester 1927 entitled *The Fundamental Problems of Phenomenology* for an explication of time as the transcendental horizon for the question of Being.⁵ At the beginning of this lecture course there is a note indicating that these lectures constitute ‘a new elaboration of the third (section) of the first part of *Being and Time*’.⁶ We know, on the report of the editor of the *Gesamtausgabe*, Friedrich von Herrmann, that Heidegger burnt the first elaboration of this third section soon after it had been written.⁷ It has been necessary to recall

these detailed references in order to emphasize the fact that the 1927 lecture course throws a new light on what Heidegger calls, in *Being and Time*, the *Temporalität des Seins*, which should be strictly distinguished from the *Zeitlichkeit des Daseins*.⁸ The theme of the horizon as the correlate of a temporal extasis, on one hand, and the theme of the *Temporalität* of Being, on the other hand, are tightly knit together, as we can see from this sentence from the 1927 lecture course that reads: 'Temporalität is Zeitlichkeit with respect to the unity of the horizontal schemas which are its own.'⁹ We can of course find some indications about this in *Being and Time*. The expression *Temporalität des Seins* appears in §5 when, after having exposed the preliminary character of the existential analysis, i.e. of the theory of the Being of Dasein as care, Heidegger emphasizes that the temporal interpretation of care, which constitutes the second section (*Dasein und Zeitlichkeit*) does not yet furnish the answer to the leading question, that is, the question of the meaning of Being in its entirety (*Sein überhaupt*), but only provides an initial basis for arriving at such an answer.¹⁰ But in fact §5 (together with §8 which sets out the plan of the whole treatise), is the only passage in *Being and Time* where we can find a reference to the leading problematics of the book. The latter does not consist – it is necessary to recall – in furnishing the basis for a philosophical anthropology, but in the explication of time as the horizon for any comprehension of Being, starting from temporality as the Being of Dasein, i.e. of the being characterized by a comprehension of Being.¹¹ Only this explanation of *Temporalität* can give a concrete answer to the question asked in *Being and Time*, the question concerning the meaning of Being.¹² But to inquire about the meaning of Being does not consist in looking for what lies behind Being, but in questioning Being itself in so far it is included in the comprehensibility of Dasein.¹³ For 'meaning' is an existential of Dasein and not a property of a being; it is that within which the comprehensibility of something maintains itself, the horizon (the *Woraufhin*, literally, the 'whither') of the project from which something as such is comprehended.¹⁴ It is therefore comprehension itself and the conditions of its possibility which have to be questioned in order to bring to light the horizon for the donation of Being. And the condition of the possibility of such a comprehension is, precisely, temporality. But *Being and Time* does not show how all comprehension implies a comprehension of Being as such, which is itself possible only on the basis of the temporality of Dasein.¹⁵ This point is developed in §20 of *The Fundamental Problems of Phenomenology* under the head 'Zeitlichkeit und Temporalität'.

Being and Time also offers some indications about the ekstatio-horizonal structure of temporality. It is in §65, where temporality is characterized as the ontological meaning of care,¹⁶ that temporality is defined as sheer *ekstatikon* (*ekstatikon schlechthin*).¹⁷ But it is only in §69, which

deals with the temporality of being-in-the-world that, in less than three pages (§69 C), the temporal problem of the transcendence of the world is explicitly treated, i.e. what, in temporality, makes the event of the world possible – the horizontal ‘schema’ that constitutes the ‘whither’ (*Wohin*), the ‘rapture’ (*Entrückung*) in terms of which the *ekstasis* takes place.¹⁸ This analysis of the ekstático-horizonal character of temporality is taken up again and developed in *The Fundamental Problems of Phenomenology* and it is completed in the lecture course from the Summer semester 1928 entitled *The Metaphysical Foundations of Logic*.¹⁹ The first part of this lecture course consists of an analysis of transcendence and intentionality and is a prefiguration of the problematics of the text written in the same year (which Heidegger dedicated in 1929 to Husserl for his seventieth birthday) under the title *Vom Wesen des Grundes*. In a passage from this 1928 lecture course (where we find the very first auto-interpretation of *Being and Time*²⁰), Heidegger seeks to show, in a retrospective manner, that the entire second section of *Being and Time* is dedicated to the elaboration of a transcendence which is in fact only explicitly mentioned in §69 C. He recalls therefore that, in a note from page 263 in *Being and Time* (which deals with the Husserlian primacy of intuition), it is explicitly said that the intentionality of consciousness is based upon the temporality of *Dasein*.²¹ This note indicates moreover that the showing of the relation between intentionality and ekstático-horizonal temporality will be dealt with in the next section, i.e. in the famous third section. It is the only indication in *Being and Time* concerning the connection between the phenomenon of intentionality and ekstático-horizonal temporality, a connection which is also mentioned, but not explicitly developed, in *The Fundamental Problems of Phenomenology*.²² What is characteristic of the Marburg lectures (held in the period when Heidegger wrote *Being and Time*²³), is the continuity of the discussion with Husserl and the emphasis on the problem of intentionality, a problem which the lecture course from 1925 already recognizes as a phenomenon which will furnish contemporary philosophy with its own proper dynamic.²⁴ The lecture course from 1927, like the one from 1928, gives an essential place to the notion of intentionality. In the discussion of Kant’s thesis stating that ‘Being is not a real predicate’, which can be reformulated in a more positive way as ‘Being is position or perception’, Heidegger declares that the constitutive elements of the intentionality of perception are not only the *intentio* and the *intentum* but also the comprehension of the mode of Being of what is aimed at in *intentum*,²⁵ showing therefore that the ontological condition of the possibility of all intentionality as such is the comprehension of Being. He further emphasizes that the possibility of bringing to light the ontological difference also calls for an investigation of intentionality, i.e. of the mode of access to Being.²⁶ The investigation of intentionality is

necessary because, as Heidegger says (in his foreword to the *Lectures for a Phenomenology of Inner Time Consciousness*, edited by him, at Husserl's request, in April 1928), intentionality is not a key word, but the title of a central problem.²⁷ To dwell inside this problem does not mean that intentionality should be regarded as a master-key capable of opening all doors,²⁸ but grasped in its principal and philosophically central signification.²⁹ On the one hand, it is necessary to see that the idea of intentionality refers (beyond Brentano's conception of intentionality as the central notion of his Psychology from an empirical point of view) to the question posed by Plato and Aristotle, i.e. to the ontological question,³⁰ and precisely because the notion of intentionality annihilates the apparent problem of the subject-object relation³¹ considered by the theory of knowledge of the nineteenth century as the basis of its problematics and therefore breaks with the classical conception of subjectivity, i.e. with the opposition of consciousness and world understood as the juxtaposition of two equally present-at-hand beings. But on the other hand, it is necessary to become aware of its limits, i.e. of the fact that intentionality is understood by Husserl as *noesis*, as a rational determination which should not be referred to the entire personality – as Max Scheler thought was the case.³² As a dimension of existence itself, intentionality is therefore only an 'ontic transcendence', a transcendence in the vulgar meaning of the word, which, as a relation to beings, has itself to be founded upon an 'archi-transcendence', the transcendence of Being-in-the-world.³³ For the intentional relation is only the factual mode of an actually required appropriation of what is already surpassed, i.e. revealed on the basis of transcendence.³⁴

By way of the theme of intentionality, and so subject to the condition of seeing in intentionality a problem and not a solution,³⁵ the question of transcendence, as a dimension of existence, still therefore has to be raised. For to exist means nothing else than to bring about the distinction between Being and beings.³⁶ To the Husserlian phenomenology that sees in intentionality the archi-phenomenon, ontology therefore stands opposed as this other transcendental science³⁷ which, on the contrary, sees in transcendence, *qua* archi-transcendence, the condition of the possibility of all 'ontic transcendence', i.e. of all intentional behaviour. But this essential determination of Dasein, i.e. of the fact that it transcends itself by itself, depends upon the ekstatico-horizonal character of temporality. It is therefore now necessary to unfold the relation of transcendence to temporality. The term 'transcendence' is certainly not taken by Heidegger in its philosophical (medieval or modern) sense but only in the original sense of the word for which *transcendere* means to go beyond, to get across, to pass over.³⁸ What Heidegger calls the ontologically 'authentic' meaning of transcendence,³⁹ understands the *transcendens* as what goes over as such and not as that in the direction of

which a 'passing over' is undertaken. It is therefore not possible to consider Dasein as immanent nor the objects as transcendent, as is the case with the vulgar, i.e. Husserlian, meaning of transcendence, because such a transcendence is not the ontic transcendence of the subject-object relation, but the comprehension of oneself from that world which constitutes the true correlate of the surpassing movement. Dasein is a being that is in the modus of self-surpassing, in the modus of *epekeina*.⁴⁰ That is the reason why Dasein's selfhood does not imply a substantial centre from which the transcending movement is supposed to start, but is, on the contrary, founded upon transcendence itself – as the condition of its very possibility. But what makes the transcendence of Dasein possible is the ekstatic character of time.⁴¹ In order to understand what that means, it is necessary, first of all, to pay attention to the transformation inflicted upon the classical opposition between objective and subjective time by the Heideggerian thinking, once the subject-object relation has become invalidated as a plausible problem. In his 1928 lecture course, Heidegger emphasizes that he deliberately names original time 'temporality' in order to give expression to the fact that time is not a predonated being (a *Vorhandene*), but, on the contrary, something whose essence is temporal.⁴² This means that, strictly speaking, time is not, but temporalizes itself and so can never be imprisoned in an ontological concept.⁴³ To think time as temporalization means giving up the attempt to elaborate a physics, or even a psychology, of time. Featuring neither as a frame for worldly events, nor for the internal processes of the psyche, it has to be accepted that time does not exist in any way at all. The 1925 lecture course closed with this conclusive statement: 'Nicht: Zeit ist, sondern: Dasein zeitigt, qua Zeit, sein Sein' (Not: time is, but Dasein temporalizes its Being, as time).⁴⁴

This implies that the unfolding of time coincides with the unfolding of Dasein and that the movements of nature are, as such, completely free with regard to time: they acquire an intra-temporality only when they are encountered 'in' the time that we ourselves are.⁴⁵ The 1928 lecture course is even more explicit and declares that temporality is the *Urfaktum*, the originary fact, and that entering into the world of beings is the *Urgeschichte*, the originary history.⁴⁶ Such an identification of Dasein and time allows us to understand why Heidegger is much less interested in the analysis Husserl gives of the phenomenon of time itself (in his lectures on *The Phenomenology of Internal Time Consciousness*) than in the elucidation of intentionality through the analysis of phenomena like perception, remembrance, expectation, etc. Many years later, when Heidegger gave a short speech at a conference organized for the thirtieth anniversary of Husserl's death, he peremptorily declared that his own question concerning time was wholly determined by the Being question and had been developed in a direction that always remained foreign to

the Husserlian investigation of time consciousness.⁴⁷ We find the same judgment in the 1928 lecture course, at a time when Husserl's lectures had just been published by Heidegger. Heidegger acknowledges, as he had already done in a note to *Being and Time*,⁴⁸ that Husserl's investigations on time constitute a measure of progress relative to contemporary psychology and the theory of knowledge, but he sees Husserl's essential achievement in the analysis of the intentional structures of time consciousness. For as far as the problem of time itself is concerned, nothing has changed relative to the tradition because time is still taken as something immanent, something internal to the subject. For Heidegger, what Husserl names 'temporal consciousness' is precisely time itself in its originary sense.⁴⁹ To understand that originary time is in fact nothing other than the totality of the modalities of temporalization belonging to existence means precisely to understand the ekstastic character of time. The phenomenon of 'expectation' as well as that of 'remembrance' are not only a way of perceiving the future and the past, but a way of interrogating the very sources of these modalities of time, not only a mode of time consciousness but, in an originary sense, time itself.⁵⁰ In the 1927 lecture course, Heidegger distinguishes clearly between the primary concept of future, past, present, i.e. the existential sense of temporality as unfolded by Dasein itself, and the expression of time that has always to do with intra-temporality. To characterize pure transcendence without the subject, that is, without Dasein, Heidegger makes use of the term *ekstasis* which, in its non-philosophical sense, simply means to stand out, which makes it a term appropriate to the literal sense of the word ex-istence. The 1928 lecture course is even more explicit in presenting originary temporality as a triple transport (*Entrückung*) without a centre, that is, without any substantial nucleus from which a temporal ekstasis could spring out, as a *raptus* through which the temporal dimensions are opened, or as a spring or swing (*Schwung*) that makes of temporalization the free swinging (*die freie Schwingung*) of originary temporality in its entirety, which alone can explain the Being-in-the-throw of Dasein, i.e. of the connection in Dasein of thrownness and projection (*Geworfenheit und Entwurf*).⁵¹

But this ekstastic character of originary temporality cannot be separated from the horizational character that belongs to all ekstasis as such. It is important to emphasize that the relation of the ekstasis to its horizon cannot be of the same kind as the relation of *intentio* and *intentum* (or *noesis* and *noema*) in ontic transcendence, that is, in intentionality. In this case, the correlate cannot be something determined because transcendence is precisely defined as the movement by which all limitations are exceeded. But the ekstasis is however not a transport towards nothingness, or a completely undetermined rapture. Rather, it projects an horizon which presents itself as a specific openness or as a schematic

pre-tracing (*schematische Vorzeichnung*) of what transcendence is aiming at.⁵² The term 'schematic' is an allusion to the Kantian transcendental schematism, about which Heidegger speaks in his lecture course from the Winter semester 1925–6 and again, in 1929, in *Kant and the Problem of Metaphysics*.⁵³ The Kantian schema is the representation of a general procedure of the imagination with a view to procuring an image for its concept;⁵⁴ in the same way, the horizontal schema of the temporal ekstasis is the condition of the possibility of the comprehension of Being.⁵⁵ But what is the exact meaning of horizon in this context? The 1928 lecture course gives the answer. Despite its usual meaning of a circular visual limit, the term horizon is not originally connected to seeing and intuition. It means, in accordance with the Greek verb *horizein*, what limits, surrounds, encloses.⁵⁶ The ekstasis, as pure rapture, surrounds and limits itself under the form of an horizon that makes it possible. Such an horizon, in spite of the fact that it belongs to ekstasis, is neither located 'in' the subject nor 'in' time or space, because it is not something that is, but something that temporalizes itself as pure possibility. Heidegger speaks of the horizon as constituting the *ekstema* of the ekstasis in analogy with the correlation of *noesis* and *noema* in the structure of intentionality, but in a completely different sense from that characteristic of the immanent structure of the noetic–noematic unity that remains internal to consciousness. The structure of transcendence, one that brings together the unity of all ekstases in the ekstematic unity of their horizons reveals the 'internal productivity specific to temporality', a productivity whose product is nothing else than the world itself. It is this productivity that Kant encountered for the first time in his theory of the productive transcendental imagination. And in spite of the fact that this genial intuition got forgotten later, it still testified to the fact that the Being of Dasein possesses the internal possibility of self-enrichment, not in an ontic, but in an ontological sense. This capacity for self-enrichment that characterizes Dasein is, in fact, nothing other than transcendence itself and it produces nothing ontic, but only this nothingness that is the world, a world which can never be understood as the sum of beings. Even though this nothingness is not a *nihil negativum*, it is, as Heidegger stresses, the *nihil originarium* that arises with and through temporalization.⁵⁷ Temporality finds its end in the horizontal schemata whose unity constitutes the nothingness of world. Since the very finitude of time precludes the possibility of its being projected upon something else, it is able to provide the ultimate light for the knowledge of beings and for the comprehension of Being. But we find no justification of the finitude of time in the 1927 lecture course since this would require a return to the question of Being-towards-death, a question developed in the second section of *Being and Time* and which alone permits us to understand what is said in §65, namely, that original time is finite precisely because it

temporalizes itself from the authentic future as anticipatory resoluteness (*vorlaufende Entschlossenheit*), i.e. as authentic Being-towards-death.⁵⁸ But death is not an end in the sense of what puts a stop to Dasein but is, on the contrary, the foundation of its finite existence. In the same manner, the finitude of time (the corollary to the finitude of Being mentioned only in the Freiburg inaugural lecture of 1929: 'What is metaphysics?')⁵⁹ is not an extrinsic limitation of Dasein but, on the contrary, the origin and starting point of its very own Being, i.e. of all possible projection – a limitation which, because it is internal, makes possible its own surpassing, i.e. makes possible both ekstasis and transcendence.

The *Temporalität des Seins* therefore constitutes the unity of that horizon from which each being can present itself in the world. It is true that in §21, in *The Fundamental Problems of Phenomenology*, Heidegger accords an apparently excessive importance to the horizon of *praesens* which latter constitutes the condition of possibility of the comprehension of the Being-ready-to-hand of the instrument, and it is equally true that the thesis developed in *Being and Time* to the effect that the future furnishes the direction for temporalization and is the primary phenomenon for originary temporality⁶⁰ is not reaffirmed in the 1927 lecture course, precisely because there is no mention of the finitude of time. But this does not mean that this thesis is given up or called in question, since it is taken up again in the 1928 lecture course.⁶¹ Moreover the primacy of the future is relative: it only characterizes the sense of originary temporalization, and that is the reason why such a primacy can be transferred to another ekstasis, depending upon the mode of existence of Dasein. Heidegger speaks in this respect of the unsteadiness of existence, an unsteadiness which comes from the fact that temporality is capable of modification and that the sense of temporalization can be changed by giving the primacy to an ekstasis other than the futural.⁶² The relation to the *Zuhandenen*, to the ready-to-hand, can occur only in the horizon of *praesens* which is the corollary of the primacy granted to the present (*Gegenwart*) and to presentation (*Gegenwärtigen*). In the *determined* perspective of a temporal interpretation of Being as Being-ready-to-hand,⁶³ the horizon of *praesens* is the leading horizon because it is the one which commands all relation to inner-worldly beings of any kind whatsoever – and in this sense it also commands the relation to the *Vorhandenen*, to the merely present being.⁶⁴ But it has to be stressed that only the unity of the horizons (not only of the *praesens* but also of what should logically be called the *praeteritum* and the *futurum*)⁶⁵ can accommodate what the 1928 lecture course already names as the event of the entrance into the world of beings (*das Ereignis des Welteinganges des Seienden*). Because this event is the primordial event (*Ureignis*), originary temporalization can only be the temporalization of the world itself as the ekstematic horizon for temporality in its entirety.⁶⁶

In the context of such an analytic of the *Temporalität des Seins*,⁶⁷ Heidegger still seems to be developing his project of an ontology¹ as a temporal and transcendental science.⁶⁸ But the 1928 lecture course also declares that this temporal analytic is at the same time *die Kehre*, the turning which brings ontology expressly back to the ontic metaphysics in which it has implicitly always stood.⁶⁹ Is this reversal to meta-ontology (mentioned in the 1928 lecture course) already, and of itself, the announcement of a *Kehre* which will allow us to think the epocality of Being and the foundation of this epocality under the name of *Ereignis*? It is difficult to answer this question as long as we do not have access to all the texts from the beginning of the thirties, and especially to the first version of 'The essence of truth' from 1930. It seems in any case that the transcendental perspective that allows the constitution of the 'metaphysics of Dasein' (developed in the writings published in 1929) as a continuation of the meta-ontological turning of 1928 must, on the contrary, be abandoned – so that the *Kehre* can be achieved. But 'abandoned' is perhaps not the correct word here: 'surmounted' says a marginal note from the *Hüttenexemplar* regarding the title of the third section in the plan presented at the end of §8 of *Being and Time*. This marginal note seems to suggest that only the surmounting of the horizon could allow a return to the origin.⁷⁰ Is this not an indication that the concept of horizon has finally proved to be inadequate to think the domain of openness, the *Spielraum* within which all beings can be encountered?⁷¹ In a text from the years 1944–5 that bears the title *Gelassenheit*, such a 'space' is given the strange name of *Gegnet*.⁷² Here representative and 'transcendental-horizonal' thinking is called in question as the dominating mode of thinking and a transformation of representative thinking into a waiting for the *Gegnet*, i.e., into an open extent⁷³ oriented toward the 'region'.⁷⁴ Such a transformation does not in fact require that the former point of view be abandoned, but rather that it should be seen in another light, after an effective change of position with regard to it. The horizon as such is also only the side, turned towards us, of an openness⁷⁵ which surrounds us and this openness should, as such, be named *Gegnet*, 'region' in the sense of a gathering locus for all extended and enduring things.⁷⁶ Surely the *Kehre* consists in considering the *Kehrseite*, the reverse side of that horizon which remains concealed from us and to any representative thinking that only draws the meaning of the terms 'horizon' and 'transcendence' from objects opposed to it?⁷⁷ To experience what 'lets' be – *sein lässt* – is to experience an horizon which leads us beyond such a representational, transcendental-horizonal thinking to a waiting that can never be understood as an anticipating because it has no object,⁷⁸ a waiting for the opening of that *Gegnet* to which we all belong. In the same manner, in 1949, the necessity of thinking the ekstasis more adequately will lead to the experience of endurance (*Aus-*

stehen), of the openness of Being. In this new light, the ekstatic essence of existence can no longer be understood as a Being-out-of-itself⁷⁹ because this could still imply a reference to the substantial centre of the self. Rather it now has to be understood as the Being *in* the truth of Being, as *Innestehen*, standing inside, *Inständigkeit*, in-stance.⁸⁰

That is why the ekstatico-horizonal constitution of temporality has to be reconsidered in the light of what Heidegger, after the *Kehre*, no longer calls the 'meaning of Being', but the 'truth of Being', the truth of a Being that is no longer understood as an *existential* of Dasein and as the goal of Dasein's transcendence, but as the origin of Dasein. For, as *The Letter on Humanism* puts it, if Being is brought to light for human being in the ekstatic project, this project does not however create Being. And so what is thrown into the project is not human being itself. Rather, it is Being itself that destines human being to be its own ek-sistence, to be the 'there' of Da-sein as its very own essence.⁸¹

Notes

1 See Heidegger, *Die Grundprobleme der Phänomenologie* (Frankfurt am Main: Klostermann, 1975), *Gesamt Ausgabe* Band 24 (abbreviated GA 24), p. 279: 'die ekstatisch-horizontale Verfassung der Zeitlichkeit'. The term *Verfassung* which is here translated in a conventional manner by 'constitution' refers more precisely to the idea of 'composition' and has the meaning of an articulated totality.

2 On the circumstances of the publication of *Being and Time* see 'Mein Weg in die Phänomenologie' in Heidegger, *Zur Sache des Denkens* (Tübingen: Niemeyer, 1969), p. 88.

3 Heidegger, *Sein und Zeit*, p. 437 (abbreviated SZ).

4 SZ, p. 39.

5 See GA 2, p. 41.

6 GA 24, p. 1.

7 See GA 2, p. 582 (Nachwort des Herausgebers).

8 The distinction between *Temporalität* and *Zeitlichkeit* is essentially a terminological distinction: see GA 24, p. 324. But this distinction was not drawn from the very beginning. In the lecture course from the Winter semester 1925–6, Heidegger still uses the term *Temporalität* to characterize the Being of Dasein. He explains that *zeitlich* means to happen in time, whereas temporal means to be characterized by time (GA 21, p. 199). At that time Heidegger still understands *Zeitlichkeit* in the 'vulgar' sense of intra-temporality and that is the reason why he then prefers the term *Temporalität* to characterize the mode of Being of Dasein. He speaks there of the *Temporalität* of care, whereas in *Being and Time* *Temporalität* refers to Being and *Zeitlichkeit* to Dasein.

9 GA 24, p. 369.

10 SZ, p. 17. It is not possible to translate 'Sein überhaupt' by 'Being in general' because Heidegger, following Aristotle, insists on the fact that there is no generic unity of Being. That is why I propose to translate it by 'Being in its entirety', and this in line with the primal meaning of 'überhaupt' a word that

originally belonged to the vocabulary of the cattle keepers and so retains the meaning of 'the whole' in opposition to 'in detail'.

11 See *SZ*, p. 17.

12 See *SZ*, p. 19.

13 *SZ*, p. 152.

14 *SZ*, p. 151.

15 There is in fact an analysis of the temporality of comprehension to be found in *Being and Time* at §68a but it tends only to elucidate the temporal meaning of comprehension in general and not to elucidate the fact that temporality is the condition of the possibility of the comprehension that Dasein has from itself.

20 As Jean Greisch emphasizes in his presentation of the complete edition of Heidegger's works in *Martin Heidegger* (Paris: Cahier de L'Herne, 1983), p. 467.

21 GA 26, p. 215: 'Und daß die Intentionalität in der Transzendenz grundet, ist gerade hier [§363, Anm.] gesagt und als ontologisches Grundproblem fixiert.' The note itself says only: 'Daß und wie die Intentionalität des "Bewußtseins" in der ekstatischen Zeitlichkeit des Dasein grundet wird der folgende Abschnitt zeigen.' The term 'transcendence' does not appear in the note itself in spite of the fact that it can be found on the same page, 363.

22 GA 24, p. 448.

23 Heidegger recalls in *Unterwegs zur Sprache* (Pfullingen: Neske, 1959), p. 95, that he began to write *Being and Time* in 1923 and we know that the book was finished in 1926.

24 *Prolegomena zur Geschichte des Zeitbegriffs*, GA 20, p. 34.

25 GA 24, pp. 100ff.

26 GA 24, p. 102.

27 See E. Husserl, *Vorlesung zur Phänomenologie des inneren Zeitbewußtseins* (Tübingen: Niemeyer, 1928), p. 1: 'Auch heute noch ist dieser Ausdruck kein Lösungswort, sondern der Titel eines zentralen Problems.' It is necessary to recall that it was Husserl himself who asked Heidegger to edit his lectures and not the reverse. Regarding the history of the manuscript of these lectures see R. Böhm's Introduction to volume X of the *Husserliana* (The Hague: Nijhoff, 1966) and W. Mieszkiewicz's article in *Revue de Métaphysique et de Morale* (1984).

28 See GA 26, p. 166.

29 See GA 26, pp. 167-8.

30 See GA 20, p. 184.

31 See GA 26, p. 168.

32 GA 26, pp. 167 and 169. In this lecture from the Summer semester 1928 during the course of which Max Scheler died (19 May 1928), Heidegger emphasizes Scheler's mediating role between Husserl and himself. Scheler refuses to see in intentionality a character of knowledge but does not go so far as to consider it a dimension of existence itself. He insists on understanding intentionality as a character of the still not thoroughly elucidated notion of personality.

33 GA 26, pp. 194 and 169.

34 GA 26, p. 253.

35 According to Heidegger, Husserl in *Ideen I* sees in intentionality a solution because he understands intentional being as the fundamental region of being, the region of pure consciousness and its correlates. Intentionality is then no

longer a question of presence but provides the 'final' solution for modern philosophy, i.e. the accomplished system of transcendental subjectivity. See the *Letter to Richardson* (1962) in W. Richardson, *Through Phenomenology to Thought* (The Hague: Nijhoff, 1963), p. xiv: 'Meanwhile "phenomenology" in Husserl's sense was elaborated into a distinctive philosophical position according to a pattern set up by Descartes, Kant and Fichte.' On this point see Brisart's excellent paper: 'L'intentionnalité comme "titre d'un problème central" selon Heidegger', *Cahiers du centre d'études phénoménologiques* (CEP 2) (Louvain la Neuve: Cabay, 1982), pp. 32–84.

36 GA 24, p. 254.

37 GA 24, p. 374. See also SZ, p. 38 where phenomenological truth is said to be *veritas transcendentalis*.

38 *ibid.*, p. 423.

39 *ibid.*, p. 425.

40 *ibid.*

41 *ibid.*, p. 428.

43 *ibid.*

44 GA 20, p. 442.

45 *ibid.*

46 GA 26, p. 270.

47 See M. Heidegger, 'Über das Zeitverständnis in der Phänomenologie und im Denken der Seinsfrage' in *Phänomenologie – lebendig oder tot?* (Karlsruhe: Badenia Verlag, 1969), p. 47.

48 See SZ, p. 433.

49 GA 26, p. 264.

50 GA 26, p. 263.

51 GA 26, p. 268.

52 GA 24, p. 435.

53 To show how the 'horizontal' thematic is dependent on a still transcendental questioning would require a thorough examination of all the texts Heidegger dedicated to Kant between 1925 and 1930. For the moment we can only stress the importance of transcendence in the Kantian sense and point out that this was as decisive for the elaboration of the Being question as Husserlian intentionality.

57 GA 26, p. 272.

58 SZ, §62.

59 *Was ist Metaphysik?* (Frankfurt am Main: Klostermann, 1960), pp. 39–40. Being is finite because it 'needs' the transcendence of Dasein in order to be revealed, because (as *Sein und Zeit* puts it on p. 212) 'there is' (*es gibt*) Being only as long as Dasein is.

60 SZ, p. 331.

61 GA 26, p. 273.

62 GA 24, p. 408.

63 See the title in GA 24 of §21 a.

64 See SZ, p. 363, where it is stressed that the objectivation, which is the operation through which the mere presence (*Vorhandenheit*) of beings is given, has the sense of a distinctive presentation (*ausgezeichneten Gegenwärtigung*).

65 It should be stressed here that, on the one hand, and in a certain sense, every horizon, as a project of Dasein, has the sense of a future from which it

is possible to come back to the beings given within such an horizon but also, on the other, that the (implicit) primacy of the horizon of the *praesens* is the foundation for all traditional ontology. That is why Heidegger accords such importance to the temporal interpretation of Being as *Vorhandenheit*.

What did Heidegger mean by 'Essence'?

Alfons Grieder

1

The word 'Wesen' ('Essence') frequently occurs in Heidegger's writings.¹ It is indeed one of his key-words. Unless we understand what he means by it we are unlikely to understand his philosophy. After all, philosophy was for him essential thinking (*wesentliches Denken*). Yet 'Wesen' is also one of his most enigmatic terms and greatly in need of elucidation, despite the fact that he commented on its meaning in many places, scattered throughout his writings, from the thirties right through to the seventies. It is not only tedious to collect these comments but, as we shall soon see, difficult to understand and adequately interpret them.

In the following I shall focus on the three periods 1925–30, 1934–8, and 1949–57. In all three periods Heidegger's meaning of 'Wesen' is inseparable from that of 'Sein' ('Being') and 'Wahrheit' ('Truth'), and by the fifties its connection with 'Language', 'World' and 'Thing' assumes a new significance. From the mid-thirties he uses the word in an increasingly unfamiliar and puzzling manner. Its change of meaning is closely associated with the famous 'turn' ('Kehre'). One has to come to grips with this metamorphosis, otherwise what the later Heidegger has to say, for instance on art and technology, will hardly be intelligible.

Unfortunately, few commentators have bothered to analyse this term 'Wesen', and to my knowledge none has done so in sufficient detail and in a way which makes sense to the uninitiated too. Obviously, little is achieved by simply repeating Heideggerian phrases and assertions as if they were crystal-clear. (As a rule they are not at all.) I am aware, of course, that the following remarks and analyses are still in some sense provisional and cannot fill this important gap in the Heidegger literature: they will almost certainly have to be complemented and revised in the light of the many still outstanding volumes of the *Gesamtausgabe*.

2

Let us begin with *Sein und Zeit* (1927). Here the term 'wesenhaft' is more frequently encountered than 'Wesen'. The adjective 'wesentlich' repeatedly occurs, and so do various compounds such as 'Wesensbestimmung', 'Wesensstruktur', 'Wesensverhalt', 'Wesensgehalt', 'Wesenscharakter', 'Wesenserkenntnis', 'Wesensaussage'.² We notice a strange ambivalence, however. At the beginning of his treatise Heidegger writes:

Das 'Wesen' des Daseins liegt in seiner Existenz³ (The 'Essence' of Dasein resides in its existence),

and he puts the term we are here concerned with into quotation marks. In subsequent places he drops the quotation marks, and we read for instance:

The analysis of this being took as its guiding thread what was in an anticipatory way determined as the Essence of Dasein;⁴

or

And if existence determines the being of Dasein and participates in the constitution of its Essence . . .⁵

On the one hand, then, Heidegger is inclined to put the term 'Wesen' 'on ice' as it were. On the other he seems to apply it without such reservations: indeed he intended *Sein und Zeit* to be a phenomenological description and interpretation of essential structures and essential characteristics of Dasein.

To understand the reasons for this ambivalence let us first recall that in *Sein und Zeit* Heidegger set out to clarify the sense of Being. The published first half of the work was meant to lay the foundation for that clarification. It is obvious that not only Being, but also the traditional distinction between essence and existence (*essentia* and *existentia*) was for him in need of elucidation, and the application of the traditional term 'existence' to Dasein highly questionable. He was unwilling to take this term 'essence' for granted as its meaning was at least partly determined in contradistinction to a suspect notion of existence. So why did he not drop it altogether, and with it all talk concerning what is 'wesentlich', 'wesenhaft', 'Wesensbestimmung', etc.? Is his procedure not viciously circular? As may be gathered from one of the above quotations Heidegger would have argued that his use of 'Wesen' and related terms is based on a 'Vorgriff', a preliminary conceptual understanding of Essence which he intended to clarify and justify in the course of the inquiry. He would

have argued that the circle in question, far from being vicious, is an unavoidable hermeneutic circle. Already at this stage, then, Heidegger must have believed that there is some proper sense of 'Essence' and that it does not coincide with that of 'essentia'.

Almost twenty years later, in a letter to Jean Beaufret, Heidegger commented on his famous proposition 'The "essence" of Dasein resides in its existence'.⁶ Again, he underlined that 'Wesen' must not be understood as *essentia* and 'Existenz' not as *existentia*. However, he also claims that the quotation marks in 'Wesen' indicate that here Essence has to be determined with respect to the ek-static character of Dasein; that Dasein essences (west) in standing out into the opening of Being (Dasein as Ek-sistence). Nevertheless, one main reason why the author of *Sein und Zeit* put the word into quotation marks was simply that he wished to guard against the misunderstanding that this Essence of Dasein was a 'what-being' (Wassein) or property of the kind we ascribe to beings which are present-at-hand (Vorhandenes). He emphasized instead that the Essence of Dasein is a way of being (eine Weise zu sein) for Dasein; it depends upon what Dasein chooses to be, upon possibilities it projects itself into; its Essence is inevitably of concern to Dasein and inseparable from its selfhood; Dasein is said to become 'essential' in authentic existence and resoluteness.⁷ In short, Heidegger wished to stress the fundamental difference between the Essence of Dasein, which is explicable in terms of existentials (Existentialien), and the Essence of beings present-at-hand. These have a different mode of being whose basic determinations are categories.⁸

Although committed to a phenomenological approach, Heidegger was aware that Husserl's *Wesensschau* (intuiting of Essences) constituted a philosophical problem.

By showing how all sight is grounded primarily in understanding (the circumspection of concern is understanding as *common sense* [*Verständigkeit*]), we have deprived pure intuition [*Anschauung*] of its priority, which corresponds noetically to the priority of the present-at-hand in traditional ontology. 'Intuition' and 'thinking' are both derivatives of understanding, and already rather remote ones. Even the phenomenological 'intuition of essences' [*Wesensschau*] is grounded in existential understanding. We can decide about this kind of seeing only if we have obtained explicit conceptions of Being and of the structure of Being, such as only phenomena in the phenomenological sense can become.⁹

In this passage Heidegger is less concerned with essences themselves than with the problem of intuiting them. However, essence and intuiting of essence belong together, as do, in a different way, the ready-to-hand

(Zuhandene) and the circumspection of everyday dealings. Not only does that intuiting derive from Dasein's understanding (Verstehen), but the mode of being of the intuited, too, is derivative, at least in the sense that it cannot be established what mode of being essences have unless the Being of Dasein has been explicated to some degree. Hence Heidegger was unwilling, at this juncture, to take Husserl's Wesensschau and phenomenological method for granted. The 'Vorgriff' he refers to does not extend to them but is confined to a particular way of seeing which concentrates on what is non-accidental in Dasein or in other beings, and to what constitutes the sense and ground of the immediately given.¹⁰

3

Some of the above points are borne out in Heidegger's Marburg lectures entitled *Die Grundprobleme der Phänomenologie*, which he delivered in the summer semester 1927. He clearly takes his approach to be a phenomenological one:

Phenomenology is the title for the method of ontology, that is, of scientific philosophy.¹¹

His manner of characterizing the phenomenological Wesensschau is rather brisk, however:

Seeing and, in analysis, interpreting in an unprejudiced way and rendering accessible and holding fast on to suchlike as an intentional structure of making something, and forming one's concepts to measure regarding what is thus got hold of and seen – this is the sober sense of the much chatted about so-called phenomenological intuition of Essence.¹²

The intentional structures referred to are ontological structures, of course. Phenomenology is the seeing and interpreting of such structures, which Heidegger also calls essential.¹³ The above passage may be taken to indicate that Heidegger is not prepared to accept the Husserlian Wesensschau and the Husserlian essences. On the other hand, he is committed to the essential structures and Essence of Dasein and their accessibility.¹⁴ Significantly, no detailed explanation of this Essence and the way it is given, i.e. the correlated intentional structures, is provided here.

This omission is not surprising, in view of the main theme of the lectures: the clarification of certain fundamental ontological structures,

and the critical elucidation of some traditional ontological theses. For one of these is precisely

the thesis of medieval ontology (scholastics) going back to Aristotle: What-being (essentia) and existence (existentia) belong to the constitution of a being.¹⁵

In Heidegger's view the traditional distinction between essence and existence is in need of elucidation and cannot be properly understood unless the question of the sense of Being is posed and answered first. Commenting on that distinction he says:

Every being is *something*, i.e. it has its *What* and has as such a certain determinate possible *manner-to-be*. . . . For us the question arises: Can we, starting from the sense of Being itself, i.e. the temporal, find out on what grounds every being must and can have a *What*, a τί, a possible manner-to-be? Do these determinations, What-being and 'manner-to-be', sufficiently widely conceived, belong to Being itself? 'Is' Being, in accordance with its essence, articulated by these determinations? We thus face *the problem of the fundamental articulation of Being* . . .¹⁶

Heidegger then allows us to catch some glimpse of that phenomenological destruction of the history of ontology to which he intended to devote the Second Part of *Being and Time*.¹⁷ He tries to show that the notions of essentia and existentia originate from one of Dasein's fundamental comportments called *Herstellen* – producing, the making of something.¹⁸ The same applied, according to his analysis, to a number of Greek notions, in particular to μορφή, εἶδος, τὸ ᾧν εἶναι and οὐσία, all of which are closely connected with, and in one sense or other, precursors of 'essentia'.¹⁹ He claims that *Herstellen* and, ultimately, the ontology of Dasein and its temporality provide the horizon within which the notion of essentia has to be clarified. If he also held that this clarification must precede the explication of his own notion 'Wesen', then it is plausible to suppose that he postponed this explication until after the completion of substantial parts of his fundamental ontology and of the phenomenological destruction of the history of ontology.

A few further points are worth emphasizing. Heidegger questions and doubts the universal applicability of 'essentia' and its Greek precursors to all and every being. Precisely because he believed that these notions originated in the realm of *Herstellen* and its artifacts he was unwilling to grant them that ontological universality. In particular, he doubted whether the mode of being of Dasein can be understood in terms of essentia and existentia, and whether the Who of Dasein coincides at all

with the What in the sense of *essentia*.²⁰ However, in these lectures he also says:

In accordance with the Essence of its existence, Dasein is 'in' truth . . .²¹

Here the connection which Heidegger emphasized in his letter to Beaufret, and which was already explicitly made in *Being and Time*, is pointed out again: being 'in' truth belongs to the Essence of Dasein.²² The two doubts – the one arising from the who of Dasein, the other from its being 'in' truth – are closely connected. The phrase 'being in truth' echoes Kierkegaard's Essential truth and the authentic self-disclosure of Dasein that goes with it.

Finally, the following passage is of interest, especially in view of Heidegger's later meditations on Essence:

what each being, whatever is real, has already been, is in German denoted by *essence*. In this essence, τὸ τί ἦν, in the *was*, resides the moment of the past, the previous.²³

Relating back to Aristotle, and to Hegel's 'Essence is being passed away' (Hegel connects 'Wesen' with 'gewesen'), these lines also remind us that already for the Heidegger of the twenties the question of Essence was intimately bound up with that of temporality, a point we shall return to.

4

Heidegger's essays *Vom Wesen des Grundes* and *Vom Wesen der Wahrheit* appear to have originated in the late twenties. However, while the former truly belongs to this time and stage in his philosophic development, the latter does not quite. *Vom Wesen der Wahrheit*, first published in 1943, is, in his own words, the repeatedly revised text of a lecture first delivered in 1930.²⁴ Its fourth edition of 1961 contains a short but important addition to section nine. The essay contains various traces of Heidegger's philosophic re-orientation in the thirties.

Although the word 'Essence' occurs in both titles, its meaning remains unclear in several respects. However, the texts – above all *Vom Wesen der Wahrheit* – throw at least some light on the problem which concerns us. According to Heidegger, not only is the question of Essence inseparable from that of Being, but 'in the concept of "Essence" philosophy thinks Being'.²⁵ Essence and Truth are similarly intertwined, Essence of Truth and Truth of Essence interwoven.²⁶ Furthermore the question of the Essence of Ground is said to be interlaced with the questions of

Being and Truth.²⁷ There is little hope, then, of elucidating Essence without getting entangled with a number of other Heideggerian notions.

In *Vom Wesen der Wahrheit* Heidegger says:

'Essence' . . . is understood as the Ground for the inner possibility of that which is at first and in general admitted as known.²⁸

Thus, the Essence of something, X, is the Ground for the inner possibility of X, where X is admitted as known. From the level of our first, common knowledge of things we have to penetrate to a deeper level, that of their inner possibility, if we want to find their Essence. We set about from 'truths' or 'grounds', say, as they are generally admitted, and determine their conditions of possibility. Of course, what Heidegger has in mind is not the Leibnizian logical possibility (consistency) at all, but something closer to, though distinct from, the Kantian transcendental conditions of possibility. In the two essays he points out that the Essence of truth as well as the Essence of ground are found in one and the same: in freedom.²⁹ Freedom here means: freedom of Dasein. Dasein is not conceived of as isolated from beings; but being-in-a-world belongs to its Essence, and so do Transcendence and Ek-sistence.³⁰ From what Heidegger tells us we cannot conclude that the Essence of all things is found in the Being of Dasein. However, we may at least take it to *depend* upon the Being of Dasein, and, correspondingly, take the way it is determined to depend upon fundamental-ontological considerations. It is not clear what the qualification 'inner' is meant to refer to. Probably he wishes to exclude any reference to such conditions of the possibility of things which are external to these things.

According to Heidegger, the Essence of truth is 'what characterizes each "truth" as truth'.³¹ His quotation marks indicate that 'truth' is first to be taken in the sense of 'what is generally admitted as truth'. To articulate something as a truth does not, in his view, necessarily imply that the Essence of what is thus articulated is also grasped; there may be a pre-conceptual and pre-ontological rather than conceptual and ontological understanding of its Being.³² Generalizing Heidegger's remark a little, we arrive at a second way of determining Essence: the Essence of something, X, is what characterizes each 'X' as X. For instance, the Essence of Dasein is that which characterizes each 'Dasein' as Dasein, the Essence of ground that which characterizes each 'ground' as ground. But does this second definition agree with the first? Is that which is the inner Ground of the possibility of something, X, the same as what characterizes each 'X' as X? Only if what characterizes each 'X' as X is not an ontic feature of 'X'; but an ontological condition of its possibility.

Vom Wesen der Wahrheit circumscribes Essence in yet a third way, namely as 'the hiding singular (Einzig) of the unique history of the

disclosure of the "sense" of what we call Being and for a long time used to think as beings in their entirety'.³³ In the light of this passage, Essences are out of the question: for Heidegger there seems to be one Essence only. This Essence underlies the history of disclosure of Being and beings alike. As we shall see, Essence is not 'in' history but rather founds history. Essence hides in at least two senses. Firstly in history, even in the past of philosophy, reigns what Heidegger calls the forgetfulness of Being; to an extent Being and Essence can be disclosed by humans, but humans have so far failed to bring about this disclosure. Secondly, however, he holds that all disclosure of Essence, Being, and beings as beings is necessarily tied to closure. It is with this in mind that we have to approach Heidegger's strange notion of Inessence (*Unwesen*). Inessence, he says, is essential to Essence: if Essence founds the history of the disclosure of Being and beings, and if this disclosure is inseparable from the closure, or hiding, of Being and beings, then Inessence too founds that history and is essential. On the other hand, in Essence as the hiding, the inessential (to be distinguished from the non-essential³⁴) comes into play. The way in which Essence and Inessence together come into play constitutes 'the essential possibilities of historical mankind'.³⁵ In this third approach much bears the stamp of the thirties. How precisely it fits in with the two earlier approaches is difficult to establish, because Heidegger gives us little to go by. However, if (as indicated above) what characterizes something as something is taken in an ontological sense as the Ground of its possibility, and if Essence is understood as the Ground of the history of the disclosure of Being, then the three ways of delineating essence need not be incompatible or incoherent.

Heidegger emphasizes again that 'Wesen', in his sense of the term, is not 'the empty "general"', not '“abstract” generality'.³⁶ Traditional essence (*κονόν, γένος*) he considers to have 'fallen away' (*abgefallen*) from Essence in his original sense. In this 'falling away' Inessence asserts itself. However, Inessence must not be identified with this 'fallen off' essence, which is only one – and a derivative – meaning of the term 'Inessence'.³⁷ A similar relationship holds, according to Heidegger, between Ground and the grounds or reasons which the traditional principle of reason (*Satz vom Grunde*) is concerned with; in this principle, too, Inessence asserts itself and obstructs our inquiry into the Essence of Ground.³⁸

5

By the mid-thirties Heidegger had begun to think in new ways about Essence; ways which are not at all peripheral to his philosophic development. In a note added to later editions of *Vom Wesen der Wahrheit* he

explains that the lecture, first given in 1930, should have been followed by a second lecture entitled 'Von der Wahrheit des Wesens' (Of the Truth of Essence), but that this project failed for reasons indicated in his letter *On Humanism*.³⁹ There is little doubt, then, that thinking about Essence and Truth, in particular about the Truth of Essence, played its part in the famous 'Kehre'.

In the following I shall draw mainly on three texts dating from the period 1935–8: his lectures on Hölderlin's hymns 'Germanien' and 'Der Rhein' (1935/6, *Gesamtausgabe*, Vol. 39), the essay 'The origin of the work of art' (1935/6), and the Freiburg lectures entitled *Grundfragen der Philosophie* (1937/8, *Gesamtausgabe*, Vol. 45). These latter lectures contain some relatively detailed reflections of Essence, unfortunately in the form of a slightly confusing mélange of Aristotelian and Heideggerian trains of thought. Here the Truth of Essence, a theme hinted at but (to my knowledge) not dealt with in detail before, is finally taken up and to some extent elucidated.⁴⁰ It is hardly accidental that this happened at a time when Heidegger was intensely occupied with art and poetry: as we shall see, in a sense the Truth of Essence is for him the Essence of art, is Poetry.

In *Grundfragen* Heidegger's basic question concerns Truth, or rather the Essence of Truth. In pursuing this question he is led into an inquiry into Essence, essential knowledge (Wesenswissen), and essential Truth (Wesenswahrheit). When he speaks of the Truth of Essence he frequently means the Truth of the Essence of something – e.g., of a table, a window, a house. It is important to take note of this and also of the somehow conventional character of Heidegger's discussion of Essence in these lectures; the more radical notion of Essence which we find in his later writings has not yet come to the fore, although his 1935/6 Hölderlin lectures already contain some indications of it. In *Grundfragen* he makes the following main points: (1) the Essence of things is brought forth rather than found in the way facts are found;⁴¹ (2) essential Truth and essential knowledge are not grounded in anything and do not have to conform to anything (unlike factual truths which must conform to factual states of affairs), but essential Truth is itself the ground and measure and is as such 'original' ('ursprünglich');⁴² (3) factual truth and factual knowledge depend upon essential Truth and essential knowledge.⁴³ In the light of these three theses Heidegger tries to show that the (already Aristotelian) claim that truth is rectitude (Richtigkeit) is itself essential Truth, 'ursprünglich' and without foundation. Thus, Heidegger dismisses the view that all truth is rectitude.

Let us examine his points in more detail! According to (1) the Essence of things is brought forth ('hervorgebracht' is his term), brought to light, while previously it is concealed, hidden, unknown. This might be taken to imply that it was there before, though unnoticed. However, to bring

it forth is according to Heidegger not simply to notice, in a leisurely sort of way, what went frequently unnoticed. He speaks of 'Er-sehen' of Essence, indicating that an effort is involved in making it accessible, and a special 'vision' required to bring us face to face with it.⁴⁴ Unfortunately, the decisive point is not sufficiently clarified. Is this 'hervorholende Heraussehen' in the end constitutive of the Essence of things, or is it not? If it is, then the bringing forth Heidegger means is creative in a sense it would not be, if it were merely a matter of coming face to face with what was already there before any 'vision' comes into play. By the way, the term 'holen' is already made use of in 'The origin of the work of art', where artistic work is said to be a *drawing out* (to use Hofstadter's translation of the term);⁴⁵ but there too the basic ambiguity is unresolved, and it remains to some extent unclear how art, as projecting and disclosing, relates to Essence.

On the face of it, then, two interpretations seem possible: (a) the Essence of things is independent of whether it is 'seen' or not 'seen', but it may be brought forth and become accessible; or (b) the Essence of things is only what it is through being 'seen', and bringing it forth amounts to an articulation without which it could not be what it is. It might appear that (a) is the more plausible interpretation of the two. Does not Heidegger's choice of words – 'hervor-gebracht', 'Zu-Gesicht-bringen' – clearly point in this direction? If (b) were the correct view, would we not expect him to explain the constitutive character of 'seeing' and 'conceiving' ('Erfassen')? Yet interpretation (a) is hardly consistent with his main point: that Truth of Essence is not rectitude. For if the Essence of things were independent of the 'seeing', would not our 'vision' of them and whatever claims we make about them be true to the extent that they conform to this essence, and false to the extent they do not? If so, then essential Truth and truth of fact would be analogous in that both would be grounded in something else; hence both would be rectitude, Richtigkeit. But this is precisely the position which Heidegger rejects, and we are therefore back to (a), despite some obvious connotations of the word 'hervorbringen'. This is not to argue, of course, that for the author of *Grundfragen* Essence was simply a human creation. Rather we have to think of it as some primordial response of men to Being and beings in accordance with which these disclose themselves to men. Given this interpretation, what is Truth as disclosure, Unverborgenheit? Clearly, 'disclosure' could not simply be taken to mean the making accessible of something which was already there before and was there independently of being disclosed; rather, disclosure would have to be the coming-into-being of the 'disclosed'. Such a notion of Truth raises fundamental problems of its own. Pursuing them, however, would lead us far beyond the confines of this essay.

Heidegger's argument that if we did not 'see' or 'conceive' Essence,

we would be blind to particular things and what they are; that therefore factual truth depends upon essential Truth, seems fairly traditional.⁴⁶ Knowledge of Essence guides us constantly and everywhere, he says.⁴⁷ Facts are disclosed only if there is disclosure of Essence. In this context, however, Heidegger makes some less familiar remarks, too, which point forward to his later thoughts on Essence and also back to his meditations on art and poetry, in 'The origin of the work of art' and in the Hölderlin lectures. Speaking of our knowledge of Essence, he remarks:

This strange state of affairs indicates that it is not the immediately given facts – the singular actual, tangible visible and that which in each case is meant and argued – which has the definite nearness to our 'life'. 'Closer to life – to use the current term – 'closer to life' than the so-called 'actuality' is the Essence of things which (Essence) we know and do not know. The near and distant is not that which the so-called man of facts (Tatsachenmensch) thinks he grasps, but the nearest in Essence, which indeed remains for most the most hidden.⁴⁸

Already here, then, Essence is what brings about nearness, neighbourhood, and thus grounds our daily 'life' while remaining mostly hidden. Heidegger goes a step further, however, when he asserts that:

the authentic calling and saying is indeed the original positing of Essence, but not by convention and adjustment (Abstimmung), but by measure-giving sovereign saying.⁴⁹

Hence it is through Language that essence originates, and with it that nearness, which is said to guide us everywhere.

Other features of Heidegger's account of Essence are perhaps less obvious. For instance, he tends to avoid the term 'Wesenheiten' and the plural of 'Wesen'; he prefers to speak of the Essence of things rather than the essences of things. A hint that the Essence of one thing and that of another are not separable in the way philosophers, speaking of the essences of things, often take them to be. We should recall that according to Heidegger beings are disclosed in their entirety. He seems to think of the Essence of things as a way they are disclosed within a whole of beings. Another important feature is hinted at in an appendix entitled 'Die Wahrheitsfrage',⁵⁰ which appears to have been composed at about the same time as the preceding lectures. Here he makes use of the unusual term 'Wesung'; he writes of 'Wesung der Wahrheit', 'Wesung des Seins' and 'Seyns'), using 'Wesung' side by side with 'Wesen'.⁵¹ The untranslatable '*Wesung*' is meant to emphasize the historical event-character of Essence, the sudden uncalculable disclosure of a whole of beings, and (in a sense) of Being itself.⁵² In this event, Heidegger tells

us, What-being (Wassein) and How-being (Wiesein) are not yet dissociated but in original unity, and he adds: 'We speak of experience (Erfahren) of *Wesung* and mean by this the knowing, voluntary, attuned *moving into* (Einfahren) *Wesung*, to stand in it and to stand it.'⁵³ Here (and in later writings, as we shall see) Essence and movement are brought together: essential experience is moving into, and (we may add) being moved by, Essence;⁵⁴ being attuned belongs to it – it is e-motion.

6

Grundfragen der Philosophie throws much light on Heidegger's notion of Essence but contains only a few passing references to art. On the other hand, in 'Der Ursprung des Kunstwerkes' and the lectures on Hölderlin's 'Germanien' and 'Der Rhein' much remains unclear just because the notion of Essence is left unclarified. Thus, with the publication of *Grundfragen*, a more thorough analysis of Heidegger's philosophy of art, as expounded in those writings of the thirties, is within reach. Of course, it is not my intention to attempt such an analysis here, and I shall restrict myself to considering how the notion of Essence relates to that of the work of art.

'Der Ursprung des Kunstwerkes' makes three basic assertions about the work of art: (1) that it is an event (or happening) of Truth (ein Wahrheitsgeschehen) and opens up the Being of beings, (2) that it sets up a World (stellt eine Welt auf) and sets forth Earth, (3) that the work of art speaks to us: art is Poetry (Dichtung) as projective Saying (entwerfendes Sagen).⁵⁵ The term 'Wesen' appears on almost every page. As in previous texts Heidegger questions its traditional meaning, but now in particular regarding its application to art. He refers to three works of art in order to illustrate his point: a Greek temple, Van Gogh's painting of a pair of shoes, and Meyer's poem 'Der römische Brunnen'. He points out that a Greek temple does not represent the idea of a temple, that Meyer's poem does not render the universal essence of a Roman fountain, and that Van Gogh's painting does not show us what all shoes have in common.⁵⁶ On the other hand he writes:

The picture that shows the peasant shoes, the poem that says the Roman fountain, do not just make manifest what this isolated being as such is – if indeed they manifest anything at all; rather, they make unconcealedness as such happen in regard to what is as a whole. The more simply and essentially the shoes are engrossed in their Essence, the more plainly and purely the fountain is engrossed in its Essence

– the more directly and engagingly do all beings attain to a greater degree of being alone with them.⁵⁷

This passage indicates that although Heidegger rejects the view that a work of art represents or expresses some general essence of things, he does hold that in the work of art Truth occurs and beings rise up into, and merge with, their Essence.⁵⁸

However, a reader trying to find out more about Heidegger's notion 'Wesen' is likely to be puzzled. 'Wesen' enters in at least three respects, and neither of these is clearly explained in the essay. Firstly, there are the Essence and essential features of the work of art itself. To this essence, we are told, belong the event of Truth, but also the setting up of a World and setting forth of the Earth, and further Poetry and Language.⁵⁹ Secondly, there is the Essence of beings which, through the work of art, 'rise up into, and merge with, their Essence'. This Essence is presumably what the projective Saying of art 'brings forth' (to use the term of *Grundfragen*). The bringing forth of their Essence opens a World. Thirdly, Heidegger speaks of the essential space (*Wesensraum*) of a work of art, the 'space' in which it 'essences' (*wesen*).⁶⁰ With the help of the context we may infer that this essential space is in fact the World which the work of art sets up, or opens. As we shall see, the verb 'wesen' does not here simply mean 'being present', but also 'to reign' or 'govern', even 'to pervade'. Let us stress the crucial point: *the Essence of the work of art consists in bringing forth the Essence of beings*. The event of truth we are concerned with here is one of *essential* Truth (in the light of *Grundfragen* we are entitled to assert it). It is also a historical event. Again, not in the trivial sense that it is found 'in' history, but in the sense that it founds history and its epochs. Beings in their entirety are disclosed differently, and their Being is determined differently in different epochs.⁶¹ 'Each time, a new and essential World opened up', Heidegger writes.⁶² Works of art brought forth the Essence of things in a new way, and in so doing set up a World. Each time beings were disclosed in their entirety, which neither means that each being was disclosed totally nor that no being remained undisclosed, but that the beings disclosed formed a whole due to an all-pervading and epoch-founding way of disclosure. As an event of Truth the work of art is said to be the strife of concealment and unconcealment. Heidegger's word 'Riss', by which he characterizes the work of art, may be translated as either 'rift' or 'drawing': art draws out the Essence of things and thus brings about a 'rift' of concealed and unconcealed, and also of Essential and Inessential.⁶³ The projective Saying he refers to is not anything separate from this bringing forth of Essence but one and the same. Language in Heidegger's original sense is this articulation of Essence and hence prior to, and much more than, an 'audible and written expression

of what is to be communicated'.⁶⁴ To summarize: In accordance with 'Der Ursprung des Kunstwerkes', World and the Essence of beings are inseparable. Beings have their Essence through belonging to a World, in which beings as a whole are disclosed. As the World changes, Essence changes. World and Essence are historical. The Essence of beings concerns their Being. In art Essence is brought forth through projective Saying, and a World is opened up. The Essence of the work of art consists in bringing forth the Essence of things. As this Essence is brought forth and constituted in different ways, different epochs and a change of Essence arise – 'the history of the Essence of occidental art unfolds'.⁶⁵

When we turn again to Van Gogh's painting of the shoes, some questions arise. Heidegger's comments on the painting appear more questionable than might have been thought at first. What Essence – or the Essence of what – did the artist's projective Saying bring forth? As Heidegger assures us, this Essence cannot be some general notion or universal essence 'shoe' or 'peasant shoe'. In view of the above one would expect it to be some mode of Being of shoes which is due to a disclosure of beings in their entirety, which opens a world and founds an epoch. This is not quite what Heidegger tells us, however. He points out that the painting reveals what equipment is; that through the painting we find 'the equipmentality of equipment'.⁶⁶ This poses further problems. Firstly, is 'equipmentality' not precisely what Heidegger wants to exclude, namely a general notion, a traditional universal essence applicable to every piece of equipment? Or is there perhaps some mysterious individual mode of being equipment which cannot possibly apply to more than one pair of shoes and which is revealed in Van Gogh's painting? But of course, being equipment is for Heidegger not at all a general property inherent in shoes, bricks, hammers and the like; nor is it a general notion, or an eternal, invariable essence which exists somehow over and above particular pieces of equipment. What he denies is not so much the general significance of equipmentality as its identification with some general property, notion or traditional essence. Instead, equipmentality is meant to characterize a mode of Being, a way in which some beings are disclosed to humans. In the light of *Being and Time* and its analysis of equipment we may agree that if the painting discloses the Being of equipment, then it reveals a basic trait of our world and of the worlds which were historically realized. That analysis also shows that equipment is disclosed as a whole within a structure of in-order-to-relations.⁶⁷ Secondly, in what way, if any, does such a disclosure of the mode of Being of equipment set up a World? It goes without saying that long before Van Gogh created this painting Worlds were in existence and shoes put on and off, worn and bought, and all kinds of other equipment used. Presumably, the painting provides an essential insight over and above that 'pre-ontological understanding of Being' (to use an

earlier term of Heidegger's) which guides us in everyday life and guided people in past Worlds. What Heidegger has primarily in mind here is an ontological insight and not an ontic one. His main point is not that through the work of art we become more aware of what kinds of shoes there are, of their actual and potential uses, or of the role they play in our daily lives. When he writes that the painting provides us with a *knowledge* of what shoe-equipment *truly is*,⁶⁸ he means that by revealing its equipmentality it reveals to us what we tend to overlook and forget while using it: its Being and with it worldliness. Thus, we may at least understand one sense in which the picture is supposed to open a World: it is meant to give us an ontological insight into the worldliness of World. However, seeing that the equipmentality of shoes is not just characteristic of our or Van Gogh's World but also e.g., of the medieval and Roman Worlds, in what sense, if any, can the picture be said to *set up* a World, to *found* a World or a specific epoch? 'Van Gogh's painting has spoken', Heidegger insists. But in what way has it spoken of Essence? The essay does not tell us in sufficient detail, and we are left with a few puzzling questions.

7

Die Technik und die Kehre (Pfullingen, 1962) comprises the texts, or enlarged texts, of a few lectures which Heidegger delivered in the years 1949, 1950 and 1955. Its first part, entitled 'Die Frage nach der Technik' also appeared in *Vorträge und Aufsätze* (1954) while the second part, 'Die Kehre' was published for the first time in 1962.⁶⁹ For anybody concerned with Heidegger's notion of Essence *Die Technik und die Kehre* is a most important text. However, commentators have frequently failed to address themselves to the problem of Essence and did not notice how closely it is bound up with the question of technology. Heidegger writes: 'It is technology which requires of us to think in a new sense what is usually understood by "essence". But in what sense?'⁷⁰ On the preceding page he remarks: 'Up to now we have understood the word "essence" in the current meaning.'⁷¹ Its current meaning is that of quidditas, whatness. It is not obvious whether he did in fact, up to page 29, use 'Wesen' consistently in this current sense. It is even less obvious in what new way 'Wesen' has to be thought of, in response to the question of technology.

'The Essence of modern technology shows itself in that which we call *Ge-stell*.'⁷² According to Heidegger, the Essence of technology is nothing technological.⁷³ He considers this Essence to be highly ambiguous.⁷⁴ On the one hand, as *Ge-stell* it is Being itself; it provokes man into disclosing the real as Bestand and (what is on order, stock).⁷⁵ On the other hand, modern technology appears as the opposite of disclosure, as closure,

blocking out, in a variety of ways: (a) it blocks out its own Essence,⁷⁶ (b) it blocks out Things,⁷⁷ (c) it prevents the nearness of World,⁷⁸ (d) it blocks the *πολίσεις*, the genuine bringing forth,⁷⁹ (e) it refuses the Truth of Being,⁸⁰ (f) it prevents man from encountering himself and his Essence,⁸¹ and (g) Ge-stell even conceals its own blocking out.⁸² We conclude that according to Heidegger, the Essence of technology consists in the provocation of humans into a peculiar disclosing of beings which is at the same time a closure and blocking out. At first sight one might see here merely the Heideggerian insistence that all disclosure is bound up with closure. However, he makes the more specific point that the seven-fold blocking out is a special and extreme kind of closure, unprecedented in the history of men.

Some linguistic signposts are meant to lead us on to the new sense of 'Wesen'. Firstly, Heidegger draws our attention to the German nouns 'Hauswesen', 'Staatswesen', and to the old word (still used by J. P. Hebel) 'die Weserei'. He points out that 'Wesen' does here not mean the universal, the general of the genus, but rather a way of 'walten', 'verwalten', unfolding and decaying. The word 'walten' is difficult to translate; the dictionary renders it as 'govern', 'rule'; but the word also has the more general sense of being active and 'in one's element' (e.g. in the phrase 'schalten und walten'). Die Weserei is the town hall, 'in so far as there communal life gathers and village life remains in play'.⁸³ Wesen, then, should be thought as that which governs – in the sense of: gathers, brings together, maintains, keeps in play. Secondly, Heidegger takes 'Wesen' in a verbal sense and emphasizes its reference to time; Wesen as *persisting* and *lasting*, not just *that which* persists and lasts.⁸⁴ Thirdly, he refers to the connection of 'das Wesende' and 'das Währende' with 'das Gewährende': with that which grants (Things).⁸⁵ According to Heidegger, then, 'Wesen', 'walten', 'währen', 'gewähren' belong together. It is in this context that the word 'Wesen' is given its meaning. Surprisingly perhaps, he does not draw our attention to that good old Alemannic phrase 'es Wäse mache' ('ein Wesen machen' – to put on a show, a display, make a fuss).

At first sight 'Wesen' as introduced in *Die Technik und die Kehre* seems to have nothing or little to do with the Socratic, Platonic or Aristotelian essences. However, Heidegger points out that these too were closely related to the temporal: and they were said to last. The Aristotelian τὸ τί ἦν εἶναι was considered to 'precede', to be prior to, particulars and by translating the term as 'the what-it-was-being' Heidegger attempts to bring out this reference to time.⁸⁶ As Essence governs, pervades, brings together the many particulars,⁸⁷ as it grants Being to them and grants us knowledge of them, it corresponds in his view to the Socratic and Platonic εἶδος or ἰδέα. However, these were understood as remaining forever invariant and in some sense beyond the variety of changing

things and instances.⁸⁸ This Heidegger did not accept: Essence is lasting (während) and changing (sich wandelnd). In short, then, Heidegger's notion 'Wesen' retains some fundamental traits of εἶδος, ἰδέα and τὸ τί ἐῖναι, while excluding (i) what he sees as their 'most current' and 'most superficial' character, namely to be simply the general with regard to a range of instances,⁸⁹ and (ii) the claim that essence is perennial-invariant, in some realm beyond time.

What, then, is Wesen according to *Die Technik und die Kehre*? To answer the question (tentatively at least) let us recall how Heidegger determines the Essence of technology. It is the Ge-stell (the Enframing, to use a current but easily misleading translation) and is said to be the lasting (das Währende), the gathering (das Versammelnde), and the granting (das Gewährnde).⁹⁰ However, this still leaves much undetermined and does not yet bring out a most crucial feature hinted at in the following lines:

For, according to all that has been said the Ge-stell is, rather, a destiny that gathers together into the provoking disclosure.

... the provoking into the ordering (Bestellen) of the real as that which is on order (Bestand, stock) still remains a destining that leads man into a way of disclosing.⁹¹

It is extremely difficult to translate this passage and preserve the meanings of, and connections between, the main verbs and nouns which Heidegger employs. Two points emerge, however: (a) the Essence of technology is a destiny (Geschick), and (b) it is a destiny that leads man into a particular way of disclosing the real – namely into disclosing it as Bestand. But what does he mean by 'Geschick', or 'destiny'? Obviously not some 'iron fate' which is imposed upon men by some non-human power; nor something which rules mankind eternally in the same way. 'Geschick' means, literally speaking, all that is sent, and all that we fit into. Here however it refers to a way of disclosure humans get into and find themselves confined to, for a certain time 'in history'. We have seen above that according to Heidegger such Geschicke do not simply occur 'in history' but bring about history; without them there would be no history at all. Geschick depends upon humans, and humans depend on Geschick. Those ways of mankind are not in the power of men: they cannot be brought about, continued or discontinued at will. They are what happens to mankind, or to peoples; what men are engaged in, neither in a purely 'passive' nor in a purely 'voluntary' manner. One destiny may give way to another, and thus a historical epoch may end and another begin to take its course. There was an ancient Greek way of disclosing the real, and now there is the technological way. Each time

humans disclose the real, and the real discloses itself to them, in a particular way. This way pervades all human thinking and doing, and the relation of men to beings as beings, and thus gives rise to an 'epoch' of history. Essence is this way of disclosing: the lasting (namely for an epoch), the gathering (of beings into a whole governed by a mode of disclosure), and the granting (making the real accessible to humans in a particular way).

8

Finally, I shall turn to Heidegger's book *Unterwegs zur Sprache* (Pfullingen, 1959). Under the title 'Vom Wesen der Sprache' it contains three lectures which he originally gave at Freiburg in 1957 and 1958. Here, in particular in the third lecture, the notion of Essence as a way of disclosing is further elaborated. Essence is now said to be das Be-wëgende – the Making way, or that which makes way.⁹² 'Be-wëgen' is then interpreted as the Saying of Language ('Essence speaks') and the interplay of the Fourfold (Heaven, Earth, Gods, Mortals).⁹³ Of course, it would be mistaken to believe that in the mid-fifties Heidegger suddenly discovered the intimate connection between what he called Essence and Language; it should be clear by now that this was a theme he had been preoccupied with long before.

As mentioned above, in *The Question Concerning Technology* we first encounter the term 'essence' with its traditional (and still current) meaning and are then directed to 'Essence' in the later and specifically Heideggerian sense. In the lectures on the 'Essence of Language' we find a similar deliberate division and transition, but now within one single sentence, the most important sentence of the essay, perhaps, and the one which is meant to provide 'the guiding word':

The essence of Language:
The Language of Essence.⁹⁴

In the first line, the word 'essence' is taken in its traditional-philosophical sense as the what-being, *Wassein*, while in the second line 'Essence' means a way of disclosing. Heidegger attempts to elucidate this latter sense as follows:

Now however the word 'Wesen' no longer means that which something is. 'Wesen' we hear as a verb [*Zeit-wort*] . . . 'Wesen' means lasting, enduring. Only, the turn of phrase '*Es west*' says more than just: It lasts and endures. '*Es west*' means: it is present [*es west an*], lasting it concerns us, moves [*be-wëgt*] and belongs [*be-langt*] us. Thought in

this way Wesen names the lasting, that which concerns us in everything, because it is that which moves everything.⁹⁵

The translation hardly speaks for itself. The slightly puzzling phrase 'wesend wie anwesend und abwesend' is difficult to render in English in such a way as not to confuse the reader even further, and I have therefore omitted it; Heidegger probably wants to say that we hear the word 'Wesen' as a verb meaning *wesen*, as in *anwesen* (being present) and *abwesen* (being absent). The word 'be-wëgen' is one of Heidegger's own linguistic creations and derives, as he explains, from the Swabian-Alemannic 'wëge' (making, laying out, paths or roads) and the High German 'bewegen' (to move).⁹⁶ 'Be-wëgen' means to *make* (lay out, prepare) ways and to *make way*, also to get under way; but here it does not at all mean to pass from one location in space to another. In the last sentence of the quotation one might expect the word *Wesen* to be put into quotation marks; for is it not the *word* 'Wesen' that names the lasting and what concerns us in all things? Or is Heidegger indicating here that *Wesen* names itself? This is indeed a possibility. For according to Heidegger it is above all Language that names; and as Language is said to be *Wesen's* 'ownmost character', *Wesen* too may be said to name things and even itself.

Wesen, *Essence*, is thus characterized in a twofold manner: (a) it is the Moving or (the term I shall from now on mainly use) Making-way; (b) it is that which speaks, that to which Language properly belongs. These are not two independent 'aspects' of *Essence*. In making way *Essence* speaks; and in Speaking it makes way. The Speaking we are concerned with here is the Making-way, and the Making-way of *Essence* its Speaking. Can we render this notion of *Essence* more intelligible at all? Let us try. In the previous section we found that *Essence* was conceived as an epoch-founding way of disclosing beings in their entirety. 'Way' must be understood in a verbal sense. Heidegger groups it together with other words such as 'wiegen' (to rock), 'wogen' (to wave, to surge), 'wagen' (to venture).⁹⁷ Here 'way' does not primarily refer to some static assembly of paths, but to the setting or laying out, finding, preparing of paths, and also to moving on a path to and fro. The setting out and the going to and fro is not meant in the spatial sense (as commonly understood), nor in the sense in which scientists may say that they have found a way or method. Rather, the ways and movements refer to the basic historical modes in which beings in their entirety disclose themselves as beings to humans. According to Heidegger this disclosure is tied to, and inseparable from, closure, not because wherever something is disclosed, something else just happens to be hidden too, but rather because disclosure depends on closure. Heidegger maintains that we find such ways of closure/disclosure in the physis of early Greek times, in the creation (the

world of created beings) of the middle ages, in the will to power and finally the Ge-stell in modern times. But what has all this to do with language? Very little, obviously, if we simply take a language as a system of signs and rules for the sake of communication. For Heidegger, however, Language is primarily a way in which Being discloses itself and beings appear as such, are *shown as beings*.⁹⁸ Given this primeval sense of 'Language', and given also that Essence is Making-way (in the sense explained), then Language may be said to belong to Essence. It may be asked on what grounds Heidegger used the word 'language' in this highly unusual way, and how precisely this primeval Language is connected with language in a more ordinary sense. However, these and other questions must remain open here, as I do not intend to give a detailed account of Heidegger's approach to language.

One last point should be mentioned: that Heidegger takes the Making-way and Speaking of Essence as constitutive of World. At this stage, however, the notion of World as expounded in *Being and Time* has been considerably modified. Now World is the interplay of the Fourfold: Earth, Heavens, Divines and Mortals.⁹⁹ The ways of disclosure, i.e. the Making-way and Speaking of Essence, are correspondingly interpreted as ways of interplay of the Four. It is these ways which grant the appearance of beings, are the enduring of a historical epoch, pervade, and gather together for a time, beings into a whole. Not surprisingly, Heidegger now says of Language that it is world-moving.¹⁰⁰ He means that the Language of Essence, by making way, laying out the paths of disclosure of beings as beings, and of Being itself, constitutes a World. Or, to use the phrase the later Heidegger was fond of: the Making-way of Essence constitutes *the worlding of World – das Welten der Welt*.

9

Let us try to sum up the preceding analysis and come to some – almost inevitably critical – conclusions. What did Heidegger mean by 'Essence'? It should at least be obvious by now that there is no simple answer to this question. The simple negative reply that he meant different things by it at different times is of course correct but insufficient and misleading. In the almost four decades considered, Heidegger's notion 'Essence' changed in quite fundamental respects. Yet this change was regulated by some relatively constant, though initially not fully clarified, philosophic intentions.

Among these 'constants' are the following:

- 1) Heidegger's conviction that philosophic thinking is essential thinking, or the thinking of the Essence of beings.

- 2) His refusal to identify this Essence with the essence of traditional metaphysics.
- 3) The insistence that the Essence of things concerns their Being and the way they are disclosed, as beings, to humans.
- 4) That this disclosure takes place within a World, the ways of disclosure structuring the World.
- 5) An intention to let himself be guided by the verbal rather than substantival sense of 'Wesen'.

These assertions are inevitably formal and sketchy, and merely indicate a range of possible orientations; words such as 'philosophic thinking', 'beings', 'disclosure', 'World', 'Essence' serve here as indicators only, each pointing to a sequence of more or less distinct Heideggerian notions.

Regarding the evolution of Heidegger's notion 'Essence', it is beyond question that significant shifts of meaning took place. To characterize this development let us distinguish three stages (a very rough distinction must suffice here):

- A. In the second half of the twenties his notion of Essence is hardly elaborated at all. On the one hand he suspends the traditional 'essentia' as questionable; on the other he makes frequent use of 'Wesen', taking his notion of *Wesen* to be a '*Vorgriff*', i.e., a preliminary grasp of something still in need of an ontological-phenomenological clarification on the basis of the first part of *Being and Time*. Although he determines the Essence of Dasein as existence and concerns himself with the analysis of what he took to be essential structures of Dasein, 'Wesen' remains a largely indeterminate notion.
- B. The thirties are marked by an original thrust towards a new though still preliminary conception of Essence. This development owes much to his intense occupation with the philosophy of art, the work of Hölderlin and Nietzsche, and with Greek philosophers (especially Plato, Aristotle, Anaximander, Parmenides, and Heraclitus). Essence, he holds, has to be brought forth by projective Saying (as in the work of art). In this way a World and historical epoch is founded. Essence is a way in which beings are disclosed as beings, which disclosure is bound up with closure (and World and Earth).
- C. In the forties and fifties his mature notion of Essence as Making-way emerges, in close connection with his attempt to come to terms with technology on the one hand, language on the other. Essence is further determined as the lasting, gathering, and granting, and thus can be seen to respond to the Platonic, Aristotelian and scholastic essences (conceived as persisting perennially, comprising particulars and granting the what-being of these as well as the possibility of their being known). But Essence as the Making-way, the speaking, and the

Moving of the Fourfold obviously takes us far beyond the philosophic tradition.

At stage A the Essence of Dasein is taken to be the key for unlocking the Essence of beings of other kinds, whatever this Essence may turn out to be. Dasein projects its own being-in-the-World; and through this project the Being of beings is disclosed. Worldiness is an existential, characteristic of the Being of Dasein. Language is a worldly manifestation of discourse, and hence (according to *Being and Time*) of 'the primordial existentials of disclosedness'.¹⁰¹ The development from A to B and C shows a shift away from the project of Dasein, in at least two respects: the Essence of things becomes historic 'Geschick' ('sent' rather than projected by Dasein; *Dasein* 'fits into it' instead of originating or founding it), and its movement of disclosure 'decentralized', as it were, and involving besides Dasein (or Mortals) also Divines, Heaven and Earth. Thus, worldliness and Language cease to be existentials in the strict sense of *Being and Time*. First it was Dasein who was said to speak, then it was the work of art, finally Essence itself. First, Making-way (if we may for a moment use this term in a general, formal sense) was Dasein's projective disclosing, then it was the event of Truth in the work of art, and finally the basic determination of Essence itself. In more than one respect the work of art became the focus of an intermediate position in this shift from A to C. For instance, Heidegger insists on the 'projective Saying of art' while playing down the artist's project of saying, which in 'The origin' remains peripheral. The event of Truth in the work of art is said to come about through strife; yet the strife meant here is not (at least not primarily) the artist's own, but that of Earth and World (some historic World). Heidegger's point is not that there is first World, which then enters into strife with Earth; but rather that through strife a 'thrust' into the unfamiliar and extraordinary occurs, and a historic World with its 'paths of essential directions'¹⁰² constitutes itself. Essence as Making-way and historic *Geschick* are here foreshadowed.

10

My objective was to give the reader an idea of what Heidegger meant by 'Wesen' and how his notion of Essence evolved. However, an exposition of this kind may easily create the impression that this notion is ultimately unproblematic and that philosophically all is well with Heidegger's approach – an impression I would prefer not to convey. I shall therefore end with a few critical reflections on what seems to represent the core of Essence. Seeing that his philosophy was, throughout the period under investigation, essential thinking, i.e., thinking of the essen-

tial, it is amazing how vague, ambiguous and fluctuating his conception of Essence was. Even what I called his mature notion is far from lucid and remained in many respects indeterminate. Of course, it is possible (though perhaps unlikely) that this judgement will have to be substantially revised once the *Gesamtausgabe* is complete. Some features of *Wesen* may readily be appreciated. That what there is discloses itself to men 'as a whole' in specific ways constitutive of historic epochs; that this disclosure is inevitably tied to specific ways of closure; that the closure/disclosure comes about above all through works of art and philosophic thought rather than the sciences: these are at least thought-provoking proposals. If it is so (to take a particularly pertinent case) that our modern technological age is characterized by an all-pervading mode of disclosure and 'blocking out' of what there is, a mode specific to this epoch of ours and not at all to Greek, medieval and even early modern times, then it is high time to think about it. But has Heidegger given us sufficiently clear indications of how to think about this fundamental constellation, how to think the Essence of things? Or are we simply plunged into the vague and controversial? To be fair to Heidegger, he never claimed to provide us with a precise, intersubjectively testable and generally acceptable theory. Far from it! He merely claimed to have made a few steps in a new direction and asked some basic questions about something that had long been forgotten – Being. He would have readily agreed that these questions – let alone the answers – remained tentative and to some degree vague, and that his way of recalling Being was bound to be controversial.

'The Essence of . . . ' is not only frequently encountered in Heidegger's writings, but it also occurs in a bewildering variety of phrases, such as

the Essence of a tree,
the Essence of a jug,
the Essence of science,
the Essence of man,
the Essence of Truth,
the Essence of Being,
the Essence of Essence,

to give a small but representative sample. A tree or a jug are particular beings. According to the above analysis of stages B and C, the Essence of beings is an epochal way in which their Being is disclosed (or in which they disclose themselves as beings) to men. Heidegger frequently emphasizes that this epochal way concerns the disclosure of beings *as a whole*. For example, in ancient Greek times the Being of beings was physis, in modern times objectivity (*Gegenständigkeit*, *Vorgestelltheit*), then will to power, and finally, in the technological age, beings show themselves as stock (*Bestand*).¹⁰³ In each case we are concerned with an

all-pervading way of Being of beings. Heidegger also speaks of the disclosure of the Being of a specific range of beings as when he determines the Essence of *Things* as 'versammelnd-ereignendes Verweilen des Gevierts' – 'the gathering-eventful dwelling of the four' (to offer one of various inadequate translations).¹⁰⁴ Now, the mode of Being of a jug cannot be identical with that of a tree, for instance. Jugs are man-made, trees are not (at least not in the same sense); trees grow and reproduce themselves in a manner jugs do not. On the other hand, neither Gegenständigkeit, nor Bestand, nor any other all-pervading way of Being seems to exhaust the Being of a jug, or that of a tree. How then is the Essence of any particular being, such as a jug, connected with those all-pervading ways? Do these differentiate themselves into a manifold of specific ways and traits of Being? Do we perhaps have to interpret the 'gathering' character of Essence primarily with an eye to *this* plurality rather than to that of particular beings?

As is well known, Heidegger insisted on the ontological difference, the fundamental distinction between beings and Being. Yet he speaks both of the Essence of beings and the Essence of Being, a fact which is puzzling. The Essence of beings, as we interpreted it, depends upon three conditions: that there 'is' Being, that there are men, and that the Being of beings is disclosed (or that they disclose themselves as beings) to men. Essence itself does not depend upon there being jugs or trees. That is, various kinds of beings may 'have' their Essence even if there were no jugs and no trees at all. However, Essence – the Essence of anything – cannot be detached from man, Truth, and Being. On these Essence depends – in an 'essential' manner, one is tempted to say; or, the Essence of Essence (Wesenheit, Essentiality) depends upon man, Truth, and Being. But can we speak of the Essence of Being, Truth or Essence in the same or at least in an analogous way in which we speak of the Essence of particular beings such as trees and jugs? The Essence of Truth would have to be the epochal way in which the Being of Truth is disclosed to men; the Essence of Being the epochal way in which the Being of Being is disclosed to them. What sense, if any, can be given to 'Being of Truth', 'Being of Being', 'Being of Essence'? As regards Truth, Heidegger calls it the Essence of the true (das Wesens des Wahren).¹⁰⁵ Thus the Essence of Truth would be the Essence of the Essence of the true, and hence an epochal way in which the Being of an epochal way of the disclosure of the Being of the true is disclosed. Logically complex states of affairs which it is difficult to see through! Furthermore, if Essence is the disclosure of the Being of beings and of Being itself, would we not have to conclude that Essence is the Truth of Being?¹⁰⁶ But how can this be brought into agreement with Heidegger's hints that Truth is the Essence of Being?¹⁰⁷ Of course, that Essence is the Truth of Being must not be taken to imply that the notion of Essence

is reducible to that of Truth of Being, and hence superfluous. For Truth and Being in turn have to be characterized by Essence, or rather Essencing ('Essence' taken in a verbal sense). Essencing is lasting and dwelling (Weilen, Verweilen);¹⁰⁸ Truth and Being last and dwell. It would be erroneous, however, to interpret this lasting and dwelling simply as 'going on in time', and to suppose that there is first a time, *in* which this or that may occur, for instance the disclosure of Being. Heidegger would have dismissed such a conception of time. Proper time belongs to Being and Truth and grants the appearance of beings. Essence seems to have its Time, Time its Essence, Truth its Being and Being its Truth, Being its Essence and Essence its Being. . . . It is obvious that for Heidegger Essence, Being, Truth, and Time belong together, are inseparable; but how precisely they are connected is far from obvious. In the end it remains unclear how 'Essence of Being', 'Essence of Truth' and 'Essence of Essence' have to be understood.

Heidegger seems to oscillate between an epochal Essence and an Essence which is in some sense transepochal. On the one hand he refers to some kind of epochal disclosure of the Being of beings, of Truth and Being itself. What the Being of beings, what Being and Truth are disclosed as characterizes an epoch; it is a way of disclosure which will give way to another.¹⁰⁹ On the other hand, Heidegger appears to hold that there is some proper Essence of beings, of Being and of Truth, an Essence which is not merely relative to an epoch. For instance, Heidegger frequently points out that man's Essence resides in his openness for Being, his Ek-stasis, his being the guardian of Being.¹¹⁰ It looks as if *this* Essence is his *proper* Essence, not just an epochal way among others in which his Being shows itself. We are given the impression that this Essence was involved throughout history, from early Greek times onwards, but that it remained concealed, and in our own technological age even 'blocked out'. If so, this Essence can hardly be taken to be an epochal way in which man's Being is disclosed but instead has to be some enduring fundamental way of being. By contrast, 'animal rationale' appears to refer to an epochal Essence of man, a way he was and understood himself. Now, we have to insist, I think, that something can only be disclosed to the extent it shows itself as it is. If man is the guardian of Being, and if animal rationale is not what he truly is, then he cannot be disclosed as the latter. We might say that *for* the age of Descartes he was animal rationale, that is, 'believed' to be such; but that he was then not understood as he truly is; as humans did not understand what man truly is there is a sense in which man *was not* what he truly is: the Guardian of Being – his proper, still unfulfilled and epochally undisclosed *possibility*. That is, we might take the proper Essence to be a possibility and 'potential' being of man, and animal rationale to be the Essence of man as he actually was and understood himself in seventeenth

century Europe. Although this may appear a plausible manner of resolving the problem of the 'two Essences' it is a rather un-Heideggerian way of overcoming it. The following account would be more in line with Heidegger's view: The one Essence of man – the guarding of Being – is an ongoing event of disclosure/closure, and epochs arise as ways in which this Essence refrains from disclosing itself in some respects to humans (refraining we take as *epoché*). This one Essence of man changes and manifests itself in different epochal ways of disclosure/closure, 'animal rationale' indicating one such way. However, this still does not remove the initial difficulty that seventeenth century man would have to be simultaneously both guardian of Being and animal rationale. Is man always guardian of Being, even as animal rationale? Was he never animal rationale at all, but did he merely for a time believe himself to be such? In my opinion neither of these two questions can be answered with a firm 'yes'; indeed it is not easy to see how the 'two Essences' can be made compatible. By the way, similar difficulties arise in connection with Heidegger's notion of truth. Here *Unverborgenheit* (Unconcealment, *alêtheia*) is taken to be the proper though long forgotten Essence of Truth, while for instance rectitude (*Richtigkeit*) is presumably an epochal Essence of Truth which, according to Heidegger, determined history since the time of Plato and Aristotle.

After all that has been said the patient reader may still wonder whether he has gained the crucial insight into the Essence of Essence, or into Heidegger's essential thinking. I have attempted to set up some signposts, but without any guarantee that they will lead on to some holy grail of Heideggerian philosophy. With some philosophers we feel that it is clear what they say, and the question is then whether what they assert is true, or how what they assert relates to other comments on the same or similar topics. Some philosophic texts, however, appear so unclear, puzzling and confusing that we first have to ask what, if anything, is asserted at all. Heidegger's place among the enigmatic thinkers seems assured. But before condemning him or treating him as a figure of fun, let us remember that sometimes the significant and profound appears in an initially unclear form. In a time like ours when so many relatively insignificant clear philosophers with relatively contracted horizons make so much noise, Heidegger's radical questions and far-reaching perspectives are bound to retain their appeal.

Notes

1 As a rule I have written crucial typically Heideggerian terms, such as 'Essence', 'Being', 'Truth' and others, with capital initials. However, in a few places (especially in Section 5) it was difficult to separate the genuinely

Heideggerian from non-Heideggerian meanings; in such cases I did not use capitals. Unfortunately, it was not possible to put German words and phrases into italics throughout as these had to be reserved for the titles of writings as well as for specially emphasized words or phrases. Unless otherwise stated, the subsequent translations from the German are my own.

The more frequently quoted Heideggerian works are referred to as follows (I have used the editions within my reach which, in most cases, do not differ significantly from earlier ones):

- GP *Grundprobleme der Phänomenologie, Gesamtausgabe*, vol. 24, Frankfurt a.M., 1975.
 GFP *Grundfragen der Philosophie, Gesamtausgabe*, vol. 45, Frankfurt a.M., 1984.
 TK *Die Technik und die Kehre*, 2nd edition, Pfullingen, 1962.
 SZ *Sein und Zeit*, 9th edition, Tübingen, 1960.
 UKW *Der Ursprung des Kunstwerkes*, Stuttgart, 1960.
 US *Unterwegs zur Sprache*, 3rd edition, Pfullingen, 1965.
 WG *Vom Wesen des Grundes*, 3rd edition, Frankfurt a.M., 1955.
 WW *Vom Wesen der Wahrheit*, 4th edition, Frankfurt a.M., 1961.

2 SZ, pp. 49, 52, 56, 121, 123, 136–7, 216.

3 SZ, p. 42.

4 SZ, p. 231.

5 SZ, p. 233.

6 'Über den Humanismus', in M. Heidegger, *Platons Lehre von der Wahrheit. Mit einem Brief über den Humanismus*, 2nd edition, Bern, 1954; see especially pp. 68–72.

7 SZ, p. 323; the quotation marks in 'essential' are Heidegger's own.

8 Compare SZ, pp. 42–5.

9 SZ, p. 147 (transl. by J. Macquarrie and E. Robinson).

10 Compare e.g., SZ, p. 35.

11 GP 24, p. 27.

12 GP 24, p. 161. As I am not of the opinion that only tailors ought to worry about elegance, I should like to apologize, once and for all, for the sometimes rather inelegant translations of Heidegger's phrases. However, it is important, in view of the objective of this paper, to keep as close as possible to the meaning of his words.

13 This is obvious from various places in these lectures (e.g., pp. 29, 219, 224, 239, 241–2) and from some of Heidegger's other writings of the period, especially *Being and Time*.

14 He goes on using terms such as 'Wesen', 'wesentlich', 'wesenhaft', much as he did in *Sein und Zeit*. See e.g., GP 24, pp. 9, 29, 31, 109, 135.

15 GP 24, p. 20. Here I had to translate Heidegger's term 'Vorhandenheit' as 'existence', for lack of another suitable term. In this context 'Vorhandenheit' is not at all synonymous with 'present-at-hand', the term used in *Being and Time*.

16 GP 24, pp. 23–4.

17 SZ, p. 39.

18 GP 24, pp. 148, 152–3, 158–60.

19 GP 24, pp. 149–51.

20 GP 24, pp. 169–70.

21 GP 24, p. 25.

22 SZ, p. 221.

23 *GP* 24, p. 120.

24 'Revised' is my translation, and interpretation, of Heidegger's slightly ambiguous term 'überprüft' which may in fact merely mean 'checked' or 'examined'.

25 *WG*, p. 2.

26 *WW*, p. 23.

27 *WG*, pp. 17, 50.

28 *WW*, p. 13. I hope I do not have to apologize for some harmlessly un-Heideggerian phrases which I had to resort to in the interpretation of this quote.

29 *WG*, pp. 53, 44, 50; *WW*, p. 12.

30 *WG*, p. 22; *WW*, p. 14.

31 *WW*, p. 5.

32 Compare *WG*, pp. 13–14. In *Vom Wesen der Wahrheit* Heidegger mentions the 'Wesenblick' through which Essence is supposed to be revealed, thus suggesting that something over and above ordinary thinking and experience is required to discover Essence.

33 *WW*, p. 25.

34 *WW*, p. 20.

35 *WW*, p. 17.

36 *WW*, p. 25.

37 *WW*, p. 20.

38 *WG*, p. 53.

39 *WW*, p. 26.

40 Compare *WW*, p. 23 and *UKW*, p. 53.

41 *GFP*, pp. 83, 85–6.

42 *GFP*, pp. 81, 83, 86, 95–6.

43 *GFP*, p. 93.

44 *GFP*, p. 85.

45 *UKW*, pp. 80, 87; M. Heidegger, *Poetry, Language, Thought* (transl. by A. Hofstadter), New York, 1971.

46 *GFP*, pp. 65–6, 84.

47 *GFP*, p. 81.

48 *GFP*, p. 82.

49 *GFP*, p. 80.

50 *GFP*, pp. 193–223.

51 Now this term is only occasionally put into quotation marks.

52 *GFP*, pp. 201, 210, 218.

53 *GFP*, p. 202.

54 Notice the relation of *Erfahren* and *Einfahren* which the English translation fails to preserve.

55 *UKW*, pp. 32, 37, 44, 60, 62, 63, 82–4. 'Earth' is a rather difficult notion giving rise to problems of its own. I shall make no attempt to interpret it in any detail here.

56 *UKW*, pp. 34–5.

57 *UKW*, pp. 60–1. This is A. Hofstadter's translation except that I have inserted the words 'Essence' and 'essential' where Hofstadter unfortunately uses 'nature' (for 'Wesen') and 'authentically' (for 'wesentlich').

58 'Rise up and merge into' is, approximately, what Heidegger means by 'aufgehen' (which Hofstadter translates as 'engross').

59 *UKW*, pp. 49, 62, 67, 85–6.

60 *UKW*, p. 39.

61 *UKW*, pp. 86, 88–9.

62 UKW, p. 88.

63 Compare UKW, pp. 51, 70–2.

64 UKW, p. 83; Hofstadter's translation.

65 UKW, p. 94.

66 UKW, pp. 32, 36.

67 See SZ, §§15 and 18.

68 UKW, p. 32.

69 TK, Vorbemerkung.

70 TK, p. 30.

71 TK, p. 29.

72 TK, p. 23.

73 TK, p. 23.

74 TK, p. 33.

75 TK, pp. 23, 37, 42–3.

76 TK, p. 21.

77 TK, pp. 37, 44.

78 TK, pp. 44, 46.

79 TK, p. 30.

80 TK, pp. 37, 45.

81 TK, p. 27.

82 'Das Ge-stell verstellt sogar noch dieses sein Verstellen.' TK, p. 44.

83 TK, p. 30. This translation is deficient in at least two respects, but I am unable to improve it: 'dörfliches Dasein' I rendered as 'village life', although 'Dasein' means 'being here', strictly speaking; 'town hall', the usual translation of 'Rathaus', unfortunately does not tie in with 'village life'.

84 TK, pp. 30–1.

85 The connection between 'to grant' and 'walten' is brought out e.g. by the fact that the German 'Walte Gott!' corresponds to the English 'God grant it!'

86 Compare GFP, p. 59.

87 'Was sie durchwaltet', TK, p. 5. See also GFP, p. 59.

88 TK, p. 30.

89 Compare GFP, p. 60.

90 TK, p. 31.

91 TK, p. 31.

92 US, p. 201.

93 US, pp. 201–2, 211, 214–15.

94 US, p. 200. Compare the similar Heideggerian inversion 'The Essence of Truth, the Truth of Essence'.

100 US, p. 215.

101 *Being and Time* (trans. by J. Macquarrie and E. Robinson), chap. 34, p. 161.

102 UKW, p. 59.

103 See e.g., GFP, p. 129; *Der Satz vom Grund*, Pfullingen, 1957, pp. 99–100; *Nietzsche*, vol. 1, Pfullingen, 1961, pp. 26, 235–40; *Holzwege*, Frankfurt a.M., 1950, pp. 226–7; TK, p. 16.

104 *Vorträge und Aufsätze*, Pfullingen, 1954, p. 172.

105 E.g., *UKW*, p. 53; *Parmenides, Gesamtausgabe*, vol. 54, Frankfurt a.M., 1982, p. 242.

106 This must not be taken to imply that Heidegger agrees with the *Hegelian* thesis that essence is the truth of being; that being passes over into essence, to be dialectically sublated in it. What Heidegger calls Essence is more akin to the Hegelian 'Gestalten' of world spirit (but without their dialectic-progressive synthesis).

107 Compare *Parmenides, Gesamtausgabe*, vol. 54, p. 242; *GFP*, p. 169; *Holzwege*, p. 332; *Nietzsche*, vol. 2, Pfullingen, 1961, pp. 335–6.

108 *Zur Sache des Denkens*, Tübingen, 1969, 'Zeit und Sein', p. 12.

109 Heidegger points out (in *Zur Sache des Denkens*, pp. 8–9) that 'epoch' refers to the refraining of being rather than to some section of a process. (The reader will recall that ἐποχή, refraining, abstention, was a key term of Greek scepticism and of Husserl's phenomenology.) Nevertheless, Heidegger clearly associates these epochs and ways of disclosure/closure with particular eras and their succession.

Theological resonances of *Der Satz vom Grund*

Joseph S. O'Leary

Is God the ground of the universe, the ground of our being? Has this question any meaning? Like so many religious questions it is tantalizingly obscure. Under analysis each of its terms dissolves into the thinnest of mists, which we no longer much like to hail as the thickest of mysteries. What is God? What is 'the universe'? What is ground? What is 'our being'? The tone of these questions is now more likely to be one of irritated puzzlement than one of reverent wonder. One is tempted to jettison all these determinations as survivals of an older metaphysical culture, or to regard them as only murky expressions of religious sentiment: Faust's *Gefühl ist alles; Name ist Schall und Rauch*. Some theologians attempt to rethink theism by dissolving God into Buddhist emptiness or into the Lacanian real. God then becomes a quality of things rather than their creative foundation and cause.

In this crumbling of theistic language, it is natural that we should turn to the philosopher who has most devoted himself to topics considered beyond the pale of reason and speech. If metaphysics cannot give precision and grip to our God-language, perhaps a really profound phenomenology can? The remedy is a risky one, but the power of the phenomena at the heart of religion assures us that the turn to a thinking led by the phenomena cannot be fruitless.

Heidegger's essentialism

The word that came most easily to Heidegger's lips was: *Wesen* (essence). The method and content of his work can be summed up under the rubric: a thinking of essence. Whenever he brings the essence of something into view, in a phenomenological *Wesensschau*, in the course of one of those stubborn, patient analyses where he has us think 'into the wind of the

matter' (GA 13, p. 78),¹ the result is so illuminating that we are likely to overlook the rarefied character of his constructions. History, to the X-ray vision that cuts through mere contingencies and distracting loose ends, knows no other movement than a parade of shining essences, e.g.:

The metaphysical beginning of the modern period is a transformation in the essence of truth, of which the ground remains hidden. . . . In the beginning of the modern period the beingness of beings undergoes a transformation. The essence of this historical beginning resides in this transformation.

(N II, pp. 295–6)

Beginning, essence, transformation, ground . . . if these constructions have any validity at all they can only benefit from being reinserted in the pluralistic texture of empirical history.

Heideggerian *essences* replace metaphysical *foundations*. We can see them only when – by a step back, or a leap of thinking – we relinquish our clinging to foundations. The dominant figure in the science of Heidegger's time is that of the *field*. His own thought moves in the field of essences (the open, the region) mapping its topology. He suggests an affinity with Einstein's space–time field in naming the open in which being is given to thought, the four-dimensional *Zeit-Raum* (ZSD, pp. 14–17). For the theological equivalent of this, one can point to Karl Barth, a phenomenologist of the Word of God, whose field of thought was the truth of revelation, grasped in its essential topology. Barth knew well the plurality of forms that Christian discourse had taken, the plurality of ways in which the divine Word made itself heard across the oblique testimonies of Scripture and church tradition. But all these forms are under judgment, and the Word which judges them is a unitary, essential instance. The judgment falls particularly heavily on non-Christian religions, seen as deluded human constructs, whereas Christianity in its essence is not a religion, but the hearing of the Word in faith. At the heart of the other religions lies no such essential revelatory and salvific event.

Today, a pluralist theology is in the making, which bears the same relation to Barth as the post-modern novel does to Proust or as the pluralistic music of Zimmermann or Stockhausen bears to Wagner. The great works of this pluralism are not cathedrals which contain and unite everything, but crossroads open to an irreducible variety of divergent cultural realms. Theology is learning to celebrate a pluralism of religious systems based in different cultural forms of life, and to see Christianity itself as a vast congeries of local theologies. Religion becomes as polymorphous as art and all its experiments are granted legitimacy, subject only to the criterion of quality, which, as in the case of art, eludes

universal formulation and presents itself in a different guise in each new cultural or historical context. The tension between essentialism and pluralism in Heidegger's thought – which is a cathedral of being, but also, to a lesser extent, a potential crossroads of dialogue – resonates with the most basic tension in religious thinking today.

The problem of theologians is: how retain the depth of Barth's meditation, the firmness of his sense of Christian identity, while embracing a pluralism that sees divine truth at work in all authentic religions? The problem of philosophers may be: how retain the depth of Heidegger's meditation, his sense of having a foothold in being, while recognizing the pluralism of philosophical languages and allowing all unitary categories to be dissolved into the multiplicity of disparate usages which they feebly attempt to mask?²

For it is increasingly apparent that the luminous meanings Barth and Heidegger established cannot be immunized against the floods of information about cultural and anthropological diversity which provide the element in which reflection of a humanistic order is today obliged to move. Heidegger's and Barth's essences are swallowed up and relativized in that pluralistic element. Their passion for the essential is alien to the more open-ended world of post-structuralism and chaos theory, where reason pursues cross-disciplinary connections, fascinated by its own margins and the dissolution of established identities. Intelligibility in this economy of thought is not the constitution of an essence but the grasp of connections. The passion for the essence of the Word of God has been abandoned by theologians who are more impressed by the historical diversity of religions and see their own tradition as an amalgam just as impure as any other. Heidegger's passion for the truth of being is seen as the last dam built by the West against its dissolution in the pot-pourri of emergent cultural holism.

There is a tension between his sense of the finite historicity of Western tradition and the implicit claim to universality in the way he talks about being. In a philosophy centred on reason such a claim is indispensable, since it is of the essence of reason that it aims at universality. But no such imperative is inscribed in Heideggerian wonder at the coming to presence of beings. This discourse on being has the radiance of an aesthetic tradition – it is universal more as Mozart is than as Euclid is. Jean Beaufret stresses the finitude of being and takes it to mean that 'being' is conceived historically as the theme of Greek reason: 'Heidegger has too much respect for the "other" to pretend to resolve the still enigmatic unity of Western thought, or the infinitely more enigmatic problem of the possible unity of the human species' (*Encyclopaedia Universalis*, 11 (Presse Universitaires de France) p. 261). Indeed he is the thinker who has most vividly revealed the pluralism within Western culture and between the West and other cultures, for the differences he

indicates are differences that count, irreducible epochal and cultural essences, not a mere encyclopedic assortment. He is a pluralist in that he is aware of the existence of other fields and is content to let them be; but he focuses his own thought on the field of Western metaphysics conceived as a unity.

Beaufret's association of the finitude of being with history applies in the case of the limited mittences of being that happen in the course of the history of being, but as far as I can see the field of being that is brought into view in the thought of the *Ereignis* is not finite in any historical sense, but only in so far as its dimensions are those of a world, a dwelling for mortals, on whose mindfulness it depends for its radiant deployment. As a prophet of the *Ereignis* Heidegger shows no modest sense of the limits of Western tradition. The word is put forward as a name for the very essence of reality itself, and Heidegger boldly suggests that its status and scope are comparable to the Chinese Tao. In alluding to the world-formula sought by Heisenberg (*ZSD*, p. 1) he betrays the immoderate ambition to think time, space and being from their unifying origin. I feel that he overreached himself at this point. In erecting the *Ereignis* as the *caput mortuum* of his thought he consigned his critical reprise of Western metaphysics to a closed system of essence instead of opening it out into a pluralistic dialogue. Still the variety of trails that lead to this dogmatic summit exhibit the pluralistic texture of Heidegger's own thinking, and his efforts to force them to converge remain blessedly inconclusive. A pluralistic reprise of Barth might show the same thing.

Heidegger's brooding on the essence of metaphysics and of what metaphysics conceals is strongly defended against empirical falsification or even modification. Whenever he is so imprudent as to step outside the phenomenological theatre of the essentializing operations, his vacuous and reactionary pronouncements on politics, culture and (in the seminars with Medard Boss) psychotherapy reveal the 'blindness' on which his 'insight' depends. At those embarrassing junctures the thoughtful differentiation of essences gives way to crude identifications – of Russia and America, or – most scandalously – of Nazism and technology. The clairvoyance with which he summons forth the essence from philosophical or poetic texts or certain phenomena of existence turns into pathetic delusion in those realms of cultural or political judgment in which one cannot make declarations about the essence without immersing oneself in a study of the facts. But even within the limits of a pure phenomenology of being, does not his refusal of pluralist solicitation entail a narrowing or a premature arrest of thought?

In what follows I shall try to discover possibilities of a pluralistic loosening up of Heidegger's style of thinking in connection with three topics: (1) his account of the essence of metaphysics, onto-theology, the history of being; (2) his proposal of a leap of thinking or a step back

from metaphysics to its forgotten origin; (3) his account of that origin itself, the truth of being, the *Ereignis*; and (4) the implications for theology. In spoiling the purity of Heidegger's essences, we must take the risk of losing the colour and relief of his vision and falling into a mere encyclopedic indifferentism. That danger has menaced the efforts of post-modernist theoreticians to think pluralism and difference more thoroughly than Heidegger's essentialism allowed. (Deleuze and Foucault, through diligent empirical study, have escaped this danger better than Derrida, Lyotard or De Man.) The pullulation of differences cannot have the power and strength that comes from insight into essence. Yet it seems that a relinquishing of essence is an imperative of contemporary thought in every field – in literary and religious studies and even in science. In forfeiting the unity of the *Ereignis* and rejoicing in a plurality of finite human worlds – many 'clearings' rather than a single one – do we devalue the world in which we live, making it just one among many possibles, and thus a mere fiction? Or is this multiplicity of the essence of human worldhood, so that the pathos or splendour of its finitude cannot be tasted without it? In any case there is not a choice; we are obliged to be tolerant under pain of being fanatical – the fate of not a few dogmatic Heideggerians.

The plurality of reason

Heidegger's project of 'overcoming metaphysics' has been the most popular of his philosophical proposals, especially among theologians, literary critics and theorists of the post-modern. A critical reconsideration of this project can never be superfluous; for even the most zealous overcomers can hardly deny that justice must be done to the metaphysical tradition and its rational claims. It may be claimed that Heidegger's most mature and serene enactment of an overcoming of metaphysics is found in *Der Satz vom Grund* (*The Principle of Reason*), and that it is also in this work that the questionable aspects and the limitations of his thought are most apparent.

(Linguistic problems, which I cannot discuss here, begin with the translation of the title. The vision of essence that comes to speech in Heidegger depends heavily on the contingencies of the German language and the lucky accidents of his own manipulations of it. In translation it invariably loses much of its imposing force. Thus cultural relativity gnaws away at the pretensions of essence. Religious thinking is also at the mercy of the contingencies of language; even the basic dogmas of the Church are unthinkable except in Greek. Translation plays the same treacherous role for Christianity as for Heidegger.)

The notion of ground was one of Heidegger's central preoccupations,

rehearsed with references to Aristotle, Leibniz, Crusius, Kant, Schelling and Schopenhauer in 1928–9 (*GA* 26; *GA* 9, pp. 123–75). Many of the historical queries one might pose while reading *Der Satz vom Grund* turn out to have been touched on, if not fully resolved, in these earlier discussions. In *Der Satz vom Grund* academic issues are left behind, leaving us free to follow a clear line of thought according to the rhythm of thought itself. But does the tangled history of the philosophy of causes and reasons admit of being grasped in such a serene play of thinking? Can thought gain access to a single perspective in which everything falls into place? Perhaps Heidegger's meditation needs to be refocused as merely one possible way of viewing the question, a modest clearing in a jungle it cannot pretend to master.

An Introduction to Metaphysics (1935) opens with a striking phenomenological evocation of the inevitability with which the question 'Why does anything exist rather than nothing?' emerges in human experience (*GA* 40, pp. 3–32). The 'rather than' (*potius quam*) carries the existential thrust of the principle of sufficient reason, a principle on which the being of beings depends. It imposes itself not only with a logical necessity and universality, but also at the existential level, emerging in the deepest human experiences. It is not surprising that this renewal of the why-question was taken up as the point of departure for the transcendental Thomist arguments of Karl Rahner. But Heidegger never sought to answer the question along such metaphysical lines; the answer is rather a leap away from the question, toward a different way of thinking the being of beings, not as indebted to a cause or reason, but as freely granted, as a 'there is' which is 'without why'. Aristotle's *aition*, 'that to which a thing is indebted for its being that which it is' (*GA* 9, p. 245), is apprehended as a letting-be of beings (*VA*, pp. 15–19).

In *Der Satz vom Grund* this shift is ingeniously anchored in Leibniz's formula, when we hear it in a new way: instead of 'nothing is without ground' it becomes 'nothing *is* without ground'. We listen, successively, to the harmonics of the two accentuations of the proposition. The basic chord of the atomic age undergoes an enharmonic shift into the basic chord of a post-metaphysical thinking. This eschatological reversal is of the same order as the shifts effected by the characteristic Heideggerian chiasmus of the type: 'The essence of speech is the speech of essence.'

The first question we must put is this: does Heidegger so absolutize the principle of reason – in both the first and the second accentuations – as to project a simplistic and rigid picture of the history of metaphysical thinking? We can pursue several aspects of this query: (1) the self-evidence and universality attributed to the principle; (2) the way in which the principle is claimed to point beyond itself by its own enigmatic character; (3) the role of the principle in metaphysics grasped as onto-theology and history of being.

I Is there a unitary principle of reason?

1 Simplistic treatment of Leibniz

Heidegger's notion of ground is a unitary one not only at the metaphysical level but in his own essential thinking. The metaphysical unity of ground is secured by Leibniz's historic enunciation of the principle of sufficient reason. Henceforth, ground is no longer in danger of falling apart into a variety of causes and principles. Yet the perfection of Leibniz's principle serves to highlight the lack of the essential thinking of ground, which Heidegger intends to provide. In 1928 the principle simply occluded the essence of ground: it was 'questionable whether the problem of the ground coincides with that of the "principle of ground"' and whether it is posed at all by this principle' and discussion of the principle served only to 'provide the occasion and mediate a first orientation' for thinking of the essence of ground (*GA* 9, pp. 125–6). The later Heidegger's more radical method of 'looking metaphysics in the face' (*GA* 29/30, p. 5)³ forbids such facile leaps and obliges him to come to more intimate grips with the power of the principle of reason.

Yet there is a limit to his engagement in both periods, in that he glosses over the immense variety of forms this principle has taken in the contexts of different philosophers' systems.⁴ As one historian remarks: '“Sufficient reason” acquires its meaning more from the context in which it is used than from any established definition attached to the words themselves.’⁵ Before Leibniz, one might cite many discussions of causality which implicitly recognize the validity of some such principle, perhaps allowing a variety of retrospective formulations of it for each of them. There are a plurality of formulations in Leibniz himself: it is a logical principle: all predicates are precontained in the notion of the subject; it is a principle underlying events: everything that happens is a consequence of the notion of the monadic substance to which it happens; as a principle grounding existence, it is the (determinative, rather than merely sufficient) principle of the most perfect; in the physical world it is a principle of efficient causality, which has merely phenomenal status.⁶

Heidegger gives a nod to this diversity but tries to put it aside as a merely historical problem:

Admittedly the principle underlies . . . manifold interpretations and evaluations. For the present purpose, however, it is convenient to take the principle in the version and role which Leibniz first explicitly gave it. But just here it is controverted whether the *principium rationis* was for Leibniz a 'logical' or a 'metaphysical' one or both.

(*GA* 9, p. 128; see *GA* 26, pp. 135–6)

Here we seem to catch Heidegger eluding the plurivocity of the notion

of ground; it is presumed that some unitary instance underlies the diverse interpretations; the suspicion that the diversity of interpretations sheds doubt on this unity is repressed. The principle of reason is declared to be much too rich to fit into the current distinctions made concerning it (GA 26, p. 145). It can be lit up only in that region in which the nature of the logical and the metaphysical, truth and ground, are first to be determined. Just as the essence of truth (unconcealment) cannot be adequately grasped in Leibniz's formulations in terms of subject and predicate, so the essence of ground eludes the terms of the principle of sufficient reason. 'The problem of the ground finds its home only there whence the essence of truth derives its inner possibility, in the essence of transcendence' (GA 9, p. 135). Though this Dasein-centred topology is later abandoned, the realm of the truth of being remains the locus of the authentic sense of ground. Both early and late the task of thinking the essence of ground from its origin presupposes some unitary sense for the expression 'ground' which is never put in question. Since the same can be said for the expressions 'truth' and 'being', one may well have qualms about the project of grasping phenomenologically how being, truth, and ground belong together. And when it came to the crunch, Heidegger himself, we suspect, let this project drop in favour of loose variations on Heraclitean notions of *Logos* and cosmic play.

No effort is made to clarify the principle by descending to its applications, with the result that the principle retains an almost oracular obscurity – in both accentuations, it is a word from being, which casts a hypnotic spell. As Vincent Descombes points out,⁷ Leibniz's principle applies primarily to matters of contingent existence – justifying them as the best states of affairs possible; whereas Heidegger, in accord with his usual practice of listening to metaphysical texts with an ear for the repressed wonder at 'the marvel of all marvels: *that beings are*' (GA 9, p. 307), wants the principle to be an utterance about being. Even in raising the question 'why are there beings rather than nothing?' Leibniz wants to justify the contingent existence of things whereas Heidegger wants to deepen a sense of the mysterious fact that 'beings are'. Has Heidegger understood Leibniz better than he understood himself, or is he interested in understanding Leibniz at all? Either his thinking of being grounds and masters reason or it is a skilful avoidance and oblivion of reason. Perhaps Heidegger's thought will remain fruitful and challenging only as long as we are unable to decide this issue, only as long as the mutual solicitation, the tug-o'-war, between reason and thinking maintains its tension.

In hailing Leibniz as paradigmatic, Heidegger tones down the idiosyncratic speculative charge the principle carries for the great rationalist. He sees that 'the Leibnizian derivation of the *principium rationis* from the essence of propositional truth thus reveals that a quite determinate

idea of being in general lies at its basis', namely, 'the monadologically understood "subjectivity" of the *subjectum* (substantiality of substance)' (GA 9, p. 135; cf. GA 26, pp. 86–123; *N II*, pp. 436–57). However, in *SG* he gives prominence to versions of the principle that sound quite innocuous and seem self-evident (helped by Wolff and his successors who had released the principle from Leibniz's speculative web). Shorn of its dazzling speculative applications the *principium grande* risks becoming a banality. Its rational force is simplified to an existential claim that hangs over ground-seeking humanity at all times. It becomes the heart-beat of the modern world. Aspects of modernity that do not fit it are glossed over.

2 Simplistic account of science

Leibniz's reduction of cause to reason is quite anti-modern in its opposition to Hobbes' and Newton's reduction of causality to merely efficient causality. 'The principle demands that everything that happens to a thing, including the causations, have a reason.'⁸ This is a retrieval of Plato's glorification of the Forms as the supreme *aitiai*. Leibniz invokes the key passage, *Phaedo* 97C, in his polemic against a causality not reducible to reasons.⁹

Seen from the point of view of its cosmological application, the principle of reason is less modern than is claimed. We see that it is a compromise, an effort at conciliation [between modern rationality and] the possibility of a musical experience of the world.¹⁰

In presuming that the modern universe is tightly bound in a network of Leibnizian deductive intelligibility, Heidegger gives an impoverished account of the texture of contemporary science. The law of universal causality is for positivists no more than a piece of methodological advice on what regularities to expect.¹¹ Heisenberg's indeterminacy principle (1927) seemed to make a breach in the stability of causality within science, though his view is criticized as a positivistic inference from the impossibility of knowing the cause of a given event to the meaninglessness of talking of its cause.¹² H.-J. Engfer states:

Modern theory of science seems to exclude any conclusive sufficient or adequate grounding of what is known: the principle of sufficient reason has now as a causal principle only the status of a hypothesis which can neither be verified nor falsified, a 'pragmatic presupposition' of research.

(*Historisches Wörterbuch der Philosophie*, 7, pp. 1132–3)

One wonders if Heidegger has not chosen the wrong target in making

so much of a principle which has so questionable a hold on the contemporary mind. Yet his critique stems from the cultural milieu in which 'acausality was being espoused years before the enunciation of Heisenberg's Principle, which was seized upon as a triumph rather than a disaster'.¹³ He might accept all the scientific criticisms of causality and still maintain that they only verify the powerful hold of the principle of reason.

The recently much-treated controversy about the nature and scope of the validity of the principle of causality has a basis and ground only through the fact that the participants in the controversy all stand under the same claim for the delivery of the sufficient reason of our representations.

(SG, p. 99)

The principle of sufficient reason, because not interrogated in its essential claim, functions all the more smoothly and powerfully in scientific and technological discourse. The 'only fruitful way' out of this rationalism 'leads through modern axiomatic representation and its hidden grounds' (SG, p. 42).

But how is this maxim compatible with the leap that Heidegger actually makes? He leaps from the principle of reason to the source from which it springs; but he does so from relatively abstract versions of the principle, never descending into the details of modern axiomatic thinking. He apprehends this thinking very globally as taking place at the behest of the principle of reason, which is 'something other than science itself'. 'The drive and the urge to remove contradictions within the multiplicity of conflicting theories and irreconcilable states of affairs stem from the claim of the *principium reddendae rationis*' (SG, p. 59). This is a wooden and monochrome account of scientific activity. Heidegger is merely vehiculating a common belief about the nature of science, which can do no justice to the vast complexity of the textures of causes, reasons and explanations in scientific discourse or in philosophical discourse including Leibniz. In attempting to make this belief operative as an analytic principle he falls headlong into a journalistic rhetoric about the 'atomic age'.

3 The pluralism of religious conceptions of ground

If this essentialist conception of ground cannot do justice to the complexities of Western philosophy and science, still less could it handle the no less complex notions of cause and reason in Indian and Chinese thought, notably the many varying accounts of 'dependent co-arising' in the Buddhist tradition. Nor can it deal with the variety of languages in which the biblical God is spoken of as maker and cause of the universe. Heidegger's understanding of this tradition is a threadbare one: religious

thinking has often been hampered by simplistic notions of cause and reason, but Heidegger himself is simplistic in what he says of the creator God of the Bible and the Scholastics (which he tends to conflate).

'Behold the heavens and the earth: they cry out that they have been made' (Augustine); that is superb, but it needs to be thought through in a way that does justice to the plurality and the obliqueness of the ways in which the world intimates its divine ground. In so far as the history of metaphysics and theology does conform to the rigid structure of onto-theology that Heidegger imposes on its variety, the notion of God as first cause enjoys a stability to which it is not entitled and which occludes the enigmatic polyvalence with which the world speaks to us of that great mystery which lies at its ground.

4 The existentializing of the principle of reason

Heidegger's unconcern with the pluralism in the history of the principle of sufficient reason is due to his primarily existential interest in the human quest for grounds and the modern rationalization of the universe in terms of grounds. It is a Kantian rather than a Leibnizian or even Wolffian version of the principle of reason that is uppermost in his mind, for it is in Kant that the principle as shaping existence and the human world comes most clearly into perspective.

What Kant says of the Leibnizian principle of sufficient reason, that it is 'a remarkable pointer to investigations which are still to be carried out in metaphysics,' holds true equally of his own highest principle of all synthetic knowledge, insofar as therein the problem of the essential interconnection of being, truth and ground lies hidden.

(GA 9, p. 136)

Being, truth and ground here have little in common with scientific notions of existence, fact, cause or explanation. Kant is stretched into existential-phenomenological shape in accord with the existential resonances of his mapping of the relation between reason and world.

Kant followed Crusius in restricting the principle to the phenomenal realm, eventually reducing it to an epistemological matter, which Heidegger translates as the grounding activity of Dasein. Things in themselves elude the principle of reason. Kant's noumenal space is thus a predecessor of the Heideggerian realm of being as groundless ground. Heidegger's existential translation of Kant permits him to eschew discussion of the epistemological or logical detail of the quest for grounds and to focus on its most simple features. However, it would not be correct to say that Heidegger accepts Kant's reduction of the principle to an epistemological, subject-centred one; for to Heidegger Kant's subject-centredness is a distortion of the phenomenality of being; the search for

grounds is an aspect of that phenomenality and as such cannot be seen as merely subjective. There is no objective ground beyond Dasein's apprehension of being as ground, not because of an epistemological phenomenalism, but for quite the opposite reason: being is truly manifest in its phenomenality; it cannot be meaningfully distinguished from its phenomenality; there is no being-in-itself beyond the phenomenality of being. Kant has served to break the power of the principle of reason, its power to point to unknown, hidden causes and grounds. Heidegger venerates the principle as an existential phenomenon and wrestles with it to regain access to the authentic phenomenality of being. But it seems that his method of thinking is inherently unable to do justice to the metaphysical reach of why-questions. It can demystify such questions in their historical forms (including especially the theological ones) by showing how they overleap the phenomena at their base; but it cannot repress the stirrings of reason that prompt their recurrence in an unpredictable variety of forms and contexts.

The phenomenology of the 'Why?' is less dramatic, more mundane, in *Der Satz vom Grund* than in *An Introduction to Metaphysics*. The focus is on everyday thinking, not on privileged moods in which the question 'why?' sounds in the depths of the soul:

human understanding itself everywhere and always, where and when it is active, is forthwith on the lookout for the ground on the basis of which that which encounters it is as it is. . . . The understanding demands a basis for its statements and its assertions. Only statements with a basis are comprehensible and sensible.

(SG, p. 13)

There is nothing ambitious or questionable about this description, which provides a solid point of departure for Heidegger's meditation.

Without being rightly aware of it, we are always in some manner or other claimed by and called to the task of attending to grounds and the ground. . . . Our behaviour in every case takes into account what the principle of sufficient reason says.

(SG, pp. 13–14)

Many classics of metaphysics begin with such declarations on the essence of the human. The opening of Aristotle's *Metaphysics*, on the universal desire to know, is echoed in that of the *Critique of Pure Reason*, on the way human reason is forced by its own nature to pose questions to which the answers lie beyond its capacities. The opening of *Der Satz vom Grund* in turn echoes both texts. All three are stylized sketches of the mind and its activities, shaped by the scientific and theoretical prac-

tices of the cultures to which they refer. A pluralist account of human dealings with principles and reasons could undermine at the base the universality and necessity here claimed for the Leibnizian principle. But it might also make these dealings less amenable to any pretence to have mastered their upshot from the vantage of a more originary kind of thinking.

5 The incubation period

Implicit in all our behaviour and ever echoing in our ear is the statement: 'nothing is without a ground.' Why then did it take over two thousand years of philosophy before Leibniz was able to enunciate that proposition explicitly? 'How strange, that a principle that lies so near to hand, and that – unarticulated – guides all human representation and comportment everywhere, should have taken so many centuries to be articulated' (*SG*, p. 15). The principle of identity as signifying a dialectical self-relation also had a long incubation period: 'For it is the philosophy of speculative idealism, prepared by Leibniz and Kant, that first establishes through Fichte, Schelling and Hegel a lodging for the intrinsically synthetic essence of identity' (*ID*, pp. 11–12). In both instances, Heidegger may be making a mountain out of a molehill. After all, isn't identity already recognized as dialectical self-relation (*auto d'heauto tauton*) in *Sophist* 254D and doesn't *Timaeus* 28C ('what has come to be must necessarily have come to be by some cause') come close to formulating the principle of reason? (Leibniz's best of all possible worlds echoes *Timaeus* 30A: 'all things should be good and nothing evil as far as possible', cf. 41B, 46D.) If the principle of reason is sleeping here, its sleep seems of the lightest.

Moreover, when Leibniz rethinks ground or Hegel rethinks identity, are they bringing to light something concealed over millennia, or are they not rather inventing a new style of thinking, a style that in our day may seem rather old-fashioned? Heidegger preserves as much as he can of the timeless and monolithic character of these principles by treating their historical formulation as a revelation of what has always lain hidden. What makes this view doubly implausible is that the emergence of the principles sends being into a still deeper sleep, while one awaits the true enunciation of the essence of identity and ground in the recovered light of being, which Heidegger brings. But looking at these proceedings naturalistically, should we not say that Heidegger, too, is inventing a new style of thinking, within a certain cultural and historical context, a style that is also already taking on an old-fashioned air?

Before Leibniz, Heidegger claims, the sheer generality and self-evidence of the search for grounds prevented us from stepping back and viewing it in its unity as a principle. But this coming to prominence of the principle of reason is not an unambiguous advance into the light. It

throws into deeper darkness the unquestioned fringes of the principle of reason. We do not seek to understand the principle of reason since it shapes all understanding; thus the step to its explicit formulation is a dizzying self-apprehension of the light in which all our thinking takes place. Yet when the light becomes self-reflexive it becomes less light; the self-apprehension fixes it and dims it.

A pluralistic reading of these claims could sight here a variety of processes whereby reflection dims the light of immediacy, but would at the same time refuse a stylized dialectical ordering of these processes in the manner of Hegel or a reduction of these processes to a single one, the forgetting of being, in the manner of Heidegger. Similarly, the move beyond reflective insight to a more originary apprehension is a simplification; there is a bundle of such possible moves in different contexts; and each of them is the creation of a new language, not a stepping back to some primitive immediacy. Both the reflective grounding of metaphysics and the essential thinking of Heidegger are epochs within the complex texture of human awareness, bracketings of its complexity in order to explore its possibilities in a stylized form. When thinking opens itself to an awareness of its own complexity, pluralism and irrepressible creativity, then it puts aside the props of these metaphysical and neo-metaphysical orderings.

II Is the principle of reason inherently enigmatic?

1 A self-contradictory principle?

The principle is so obvious that any intellectual puzzling about it seems superfluous and unnatural. 'And yet – perhaps the principle of reason is the most enigmatic of all possible propositions' (*SG*, p. 16). Heidegger has been teasing at such apparent self-evidence at least since his querying of banal notions of being at the beginning of *Sein und Zeit*, and his suspicions already focused on the self-evidence of the basic laws of thought: 'Suppose that it belongs to the essential character of philosophy to make just that which is self-evident into something incomprehensible, and that which goes without question into something questionable!' (*GA* 26, p. 6). It is not just petrified philosophoumena that are open to question, but the everyday understanding of being, and the everyday routine of seeking reasons for things; unquestioned, this routine tightens into a tyranny, as the principle of reason extends its sway into every department of life.

In questioning the principle, Heidegger never invokes the plurality of its possible forms or interpretations, which might cause its unity to unravel. Rather, he seeks to subvert it by finding an enigma in its essential structure; an enigma which can be resolved only by a more originary clarification of this essential structure. The enigma is one that

bothered post-Leibnizian philosophers: namely, that the principle of sufficient reason lacks a sufficient reason, and is thus intrinsically placed in contradiction with itself (*SG*, p. 37).

To accentuate the enigma, Heidegger dwells on the necessity and universal scope of the principle. 'What it posits, it posits as something necessary. This it utters as something un-circumventable through the double negation "Nothing . . . without . . ."' (*SG*, p. 18). He never considers the view that

the principle of sufficient reason may be applied to everything save to itself and to such elements of discourse as function as explainers in a given context. Such a limitation of the range of the principle of sufficient reason, far from curtailing the programme of attaining a rational understanding of the world, is rather a condition for its consistent fulfilment, for it avoids both vicious circles and the assignment of a fictitious 'final reason of things'.¹⁴

Does he resolve the puzzle? He claims to do so by a step back into the light: 'On what is the principle of ground grounded? . . . What light does the principle need in order to be luminous? Do we see this light?' (*SG*, p. 18). Compare 1928:

It is easily seen that this thesis, namely, the principle of reason taken in its broadest sense, itself requires to be grounded. And that this grounding is clearly only to be attained with the clarification of the essence of being in general.

(*GA* 26, p. 138)

To this one may object that if the essence of being grounds the principle of reason it does so with a quite other kind of grounding than that which the principle in its first accentuation so imperatively demands. The inner contradiction of the principle is thus not resolved; unless by a complete collapse of the principle in its first accentuation in favour of the looser connections of the second.

2 Much ado about nothing?

'The principle of ground is the ground-principle of all ground-principles. This indication ushers us with a scarcely perceptible push into the abyss of riddles that yawns about the principle and about what it says' (*SG*, p. 21). The principle of identity, for example, can be interpreted as 'the belonging together of different things on the ground of the same. On the ground? The same comes into play here as the ground of the belonging-together' (*SG*, p. 22), so the principle of identity appears to depend on the principle of reason. But the principle of reason 'presupposes that

it is determined what a reason is, that it is clear in what the essence of reasons consists' (*SG*, p. 23). How can a ground-principle take something so essential for granted?

The abysses Heidegger finds here are scarcely hinted at in most discussions of sufficient reason. Indeed, Heidegger's awe presupposes that the question of ground is one that governs human existence through and through and that involves the whole of being. Is he transposing onto a logical puzzle the pathos that properly appertains only to the sense of the ungroundedness of existence that one has in the experience of anxiety? Or is he exploiting an apparent antinomy, somewhat as Kant did, in order to dissolve the metaphysical question of ground into an existential vertigo? Infiltrating the riddles of reason with the obscurities of existence, he risks losing a precise grip on both.

The self-evidence of the principle could have been undermined by a more prosaic logical analysis, which would have whittled down its claimed necessity and universality rather than forcing it to a paroxysm in which it begins to undermine itself. The detected antinomy could be dissipated if one showed that the unitary principle, rather than rendering transparent their essential law, occludes a great variety of grounding activities, which are irreducible to a single rubric. A similar plurality might also be uncovered in everyday searches for reasons and grounds.

'The principle of ground is the ground of the principle. . . . Here something coils in on itself, yet does not close itself off, but at the same time unbolts itself. Here is a ring, a living ring, something like a snake' (*SG*, p. 31). The vertigo induced by these reflections indicates something like a black hole of thought into which reason cannot proceed without becoming twisted. Metaphysics is thus overcome by its own devices. Yet is this the trail back to the origin that Heidegger actually follows? The change of accentuation engineers a shift from representational thinking of beings to contemplative listening to being. The logical riddles of the basic principles play at most the role of disabling metaphysical thinking as it tries to reach back to its ultimate grounds.

Having used logical antinomies to launch the leap of thinking, Heidegger leaves them unsolved. Did he really take them seriously or were they a mere pretext?

Heidegger took reason seriously all his life. [To echo Carlyle: 'Egad, he'd better!'] True, but now we can see that he did that in order to make a leap out of its domain into the play. He took reason seriously just long enough to show that there is a sphere of play outside the reach of the principle of reason.¹⁵

This seems an accurate description of Heidegger's strategy – but can one choose to patronize reason in this way?

3 The strict formulation

Heidegger turns to the strict formulation of the principle of reason as the *principium reddendae rationis*, the principle that 'for every truth (that is, according to Leibniz, for every true proposition) the ground can be given back' (*SG*, p. 44). Allers objects that this is not the stricter version for Leibniz, but a methodological version; whereas the looser version is ontological. Moreover *reddere* means simply to give, rather than to give back, and *principium grande* means simply 'big' rather than 'mighty' principle. Here, as in the ontological reading of 'the rose is without why', Heidegger's attention to the archaic or etymological undertones of words can be defended for its fertility in launching thought. Descombes points out that *reddendum* does not have the imperative thrust Heidegger gives it, and does not justify the transition marked in a comment of Derrida's rendering of Heidegger's account: 'From the moment that reason can be delivered [*reddi potest*], it must be.'¹⁶

How explain this leap in the modalities? Since when has the possibility of something sufficed to determine its necessity? This transition is still more astonishing than that of the so-called ontological argument. . . . For we see here, in addition to the illegitimate transition from a weak to a strong modality, a personal ('destinal') surcharge of the necessity in question.

One might justify such exegesis on the basis that 'The immoderateness of metaphysics demands that the translator always choose the meaning which is most serious, most difficult and which bears most consequences'.¹⁷ Heidegger is always on the alert for the great world-shaping forces indicated by a mere rustle in the language of the texts he studies. What is only a gentle hint in Leibniz is pregnant with the immoderate demands of Reason that will sound ever more mightily in Kant, Hegel, Marx, contemporary science and technology. It is because we find ourselves under the sway of this unconditional demand of the principle of reason that we are sensitive to the faintest intimations of its force in the Leibnizian text. However, Descombes rejects this way of reading Leibniz as a surrender to the very immoderateness it aims to overcome. Heidegger allows the awesome claim of the principle of reason to swallow up all philosophical reasoning in a single massive call from being. Had he instead relativized the principle of reason by putting it back in its historical context in Leibniz and others, he might have found a more serene path beyond the darkening of the world in technology, one more practicable and more convincing than the apocalyptic leap to which he finally invites us.

Our representations do not become genuine knowledge unless their

ground can be delivered (SG, p. 45). Is this second version of the principle confined to cognition only? No, it insists that the object of cognition must be something grounded (SG, p. 46). It means: 'Something "is" only, that is, is identified as a being, when it is stated in a proposition that satisfies the ground-principle of ground as the ground-principle of the giving of grounds' (SG, p. 47). It is a requisite for existence. The might of the demand for the delivery of the ground, which dictates whether anything deserves to be recognized as a being, lays claim on everything that is. 'Only that which is brought to a stand in a grounded representation can qualify as being' (SG, p. 54). Again, the metaphysical force of this is blunted by Heidegger's focus on its implications for the phenomenality of being and world.

'Whence speaks this claim of the ground to its own delivery?' (SG, p. 57). To hear the language of this claim we must attend to it phenomenologically rather than continue to obey it somnambulistically as the ultimate force behind the 'atomic age': 'The claim to the delivery [*Zustellung*] of the ground is for science the element in which its cogitation [*Vorstellen*] moves as the fish in water or the bird in air' (SG, p. 59). But to realize this is more difficult than to be aware of the radioactivity of the atmosphere, which we have instruments to measure (SG, p. 57). An element of nuclear panic or paranoia seems to be associated with this magnification of the power of the principle of reason. This power is uncanny, unhomely: it takes away from contemporary humanity the ground under their feet; the more we blindly comply with its claim, the less we can build and dwell in the realm of the essential (SG, p. 60). This play between delivery of the ground and withdrawal of the ground under our feet (*Entzug des Bodens*) is our sinister epochal variant of the 'play of being' to which reference is made later (SG, p. 109, 188).

All of this now has a fifties air to it, and seems inapplicable to the contemporary condition, which we cannot see as explicable from a single principle. If our consumerist world-culture were so firmly in the grip of a principle, then the promised leap and reversal would be attractive. But its uniformity has nothing to do with metaphysical reason; it floats detached from any claim of the ground; we can leap from the ground all too lightly, but with little hope of landing in a play any more substantial than that which is going on. The pluralistic texture of our experience dissolves the claim of unitary grounds, and also of unitary leaps. What path of thinking can negotiate the promise and threat of this state of affairs?

III Metaphysics as onto-theology and history of being

1 A phenomenological perspective

Heidegger's gaze on metaphysics is a phenomenological one; that is why he pays so much attention to the obstacles to this gaze, the natural

tendency to turn one's eyes away from any deeper apprehension of the metaphysical enterprise. The plot is thickened from the fact that metaphysics itself is an effort to look in the face a truth that everyday reason looks away from. By bringing into one's gaze the shape of one's thinking – not of any ordinary thinking, but that thinking that has attained metaphysical status – one finds that metaphysics itself is constitutionally inadequate to the phenomenon of being; that being is manifest in metaphysics as that which remains withdrawn. What comes into view is the finitude and brokenness of thinking, not in the sense that the grasp of reason fails to seize its object or that its systems crumble, but in the sense that the more it succeeds the more the truth of being eludes it.

Heidegger projects an essence of metaphysics, most tightly formulated as onto-theology, which need not be perfectly congruent with the empirical development of the history of philosophy. Great historical hypotheses are not falsified by a few facts that fail to fit; indeed their greatness is shown by the number of such discordant facts that they can take in their stride. Heidegger's hypothesis is sufficiently well-grounded and illuminating to be immune to random empirical objections; it will lose its force only when replaced by a better one. The objection that he ignored the Hebraic component in the history of philosophy should be expanded to embrace his systematic ironing-out of all pluralistic interferences in his focusing of the Greek essence, an essence that has sufficient autonomy to support Heidegger's constructions, which can be replaced only by a better account of what metaphysics meant.

Starting from a sense of the pluralistic texture of intellectual history, how might we revise, or eventually replace, Heidegger's constructions so as to make them more fruitful for our own intercultural regime of thinking?

2 What is onto-theology?

Onto-theology is the supreme self-grasp of the intelligibility of being. It is a product of the question of ground.

Since being appears as ground beings are the grounded, but the highest being is that which grounds in the sense of the first cause. . . . The onto-theological constitution of metaphysics stems from the sway of the difference, which holds apart and together being as ground and beings as grounded-grounding.

(*ID*, p. 63)

The authentic phenomenology of being and beings in their difference resides in

a realm which the leading words of metaphysics, being and beings,

ground-grounded, no longer suffice to say. For what these words name, what the way of thinking led by them represents, stems as the different from the difference. Their source no longer allows itself to be thought in the field of vision of metaphysics.

(*ID*, pp. 63–4)

The onto-theological constitution of metaphysics originates from the effort to think about 'being' and 'beings' in terms of identity and causal or explanatory grounds (cf. *GA* 42, pp. 87–8, 130–47). For metaphysics, being is that which all beings have in common, being-as-such. Thought of in its generality, being-as-such is an identity in difference which provides the horizontal onto-logical dimension; thought of as a whole being-as-such is referred to a supreme being, the apex of the vertical theological dimension, who unifies beings-as-a-whole. Both lines of thought proceed in mutual dependence.

Metaphysics thinks the being of beings both in the foundational [*ergründend*] unity of the most general, i.e., that which everywhere amounts to the same, and in the founding [*begründend*] unity of totality, i.e., that which is highest over all. Thus the being of beings is thought of beforehand as grounding ground.

(*ID*, p. 49; cf. *GA* 9, pp. 378–9; *ZSD*, p. 62)

Metaphysics seeks the being of beings by grounding it in a highest being (the cause of existence) or an exemplary mode of being (the ground of essence, e.g. the Kantian subject as the condition of possibility of all objectivity); the transcendent, theo-logical and transcendental, onto-logical modes of grounding coincide in the Hegelian 'determination of the highest being as the absolute in the sense of unconditioned subjectivity' (*N II*, p. 347). What is afoot here is no wooden construction but the self-constitution of reason, faithful to its own most intimate principle.

Heidegger makes much of the notion of *causa sui*, which Pierre Hadot defines as the production of God's existence through his essence (*Historisches Wörterbuch der Philosophie* 1, pp. 976–7). He sees it as the logical culmination of onto-theo-logy, a kind of death's head before which it is impossible to pray (*ID*, pp. 51, 64). He presented an attractive version of the idea in Schelling's account of the interplay between ground and existence in God, with its echoes of Eckhart and Boehme (*GA* 42, p. 204) and its basis in the paradox that while God, the ultimate reason for the existence of anything at all rather than nothing, himself depends on the principle of reason, the mighty working of the principle must itself have a cause: 'The principle of reason is valid only in so far as God exists. But God exists, only in so far as the principle of reason is valid' (*SG*, p. 55). The controverted status of the *causa sui* within meta-

physics – a metaphorical expression in Plotinus (Stanislas Breton, *HQD*, pp. 253–6), replaced by divine *aseitas* in the Scholastics, rejected by Kant, treated as a simple expression of the purity of being in the later Schelling – is ignored by Heidegger, who probably sees it as a failure of metaphysics to recognize its own logic.

When Christians have asked such questions as ‘What is the ground of God’s being the ground of creation?’ they have tended to answer by radicalizing the grounding nature of God, but not by saying that God is *causa sui*. The question of ultimate grounds in Christian thinking leads to the abyss of divine freedom; his actions are grounded in free decrees whose motives are ‘unsearchable’ (Romans 11.33). All theology can do is defend God’s actions against the charge of absurdity or contradiction and meditate on their appropriateness (*convenientia*) to divine goodness and justice. Such an ‘overcoming of metaphysics’ based on the ‘difference’ of divine transcendence and freedom is of no interest to Heidegger. His aim is to overcome metaphysics from within, tracing the inner transformations of its essence. Measured against the pattern of onto-theology isolated by Heidegger, all traditional metaphysicians (Leibniz and Hegel included) provide impure amalgams of metaphysical reason and mythical or biblical factors.

If for one moment the possibility is admitted that this distillation of the essence of metaphysics is only a possible interpretation among others, then the project of overcoming metaphysics by tackling its essential structure falls to the ground, and a more flexible and mobile strategy must be devised, one that recognizes the irremediable impurity of the tradition and the impossibility of moving to a less pluralistic level of thinking. The refusal of the onto-theological possibilities of thinking then becomes one of the possible tactics whereby one moves from a vaguely defined ‘metaphysical’ regime of thought to a dimly apprehended post-metaphysical economy. In each case one identifies possible schemata of ‘metaphysical’ thinking, whose limits can be discerned, and one tests the styles of thinking that may emerge when one leaps beyond these schemata. In the context of such a project of conquering new spaces for thought it is a matter of secondary importance whether the schema to be overcome ever had any identifiable embodiment in history or whether it subsisted only in an irreducible plurality of guises. The fragility of Heidegger’s reconstructions of the essence and history of metaphysics argue for such a pluralistic reinterpretation of his experiments in overcoming.

3 The history of being

‘The leap [away from metaphysics] is a backward-looking leap. It looks back into the realm from which it has leaped away, in order to keep it in view’ (*SG*, p. 129). After the leap of thinking we may revisit the various detours which have prepared it and bring into view their inner

connection (SG, p. 96). 'In leaping, the leap becomes a thoughtful appropriation of the destiny of being' (SG, p. 158). The first major theme to be reviewed is that of the incubation period, now seen in a new light in view of the fact that 'what the principle truly says, being, is really still sleeping' (SG, p. 97). The incubation period is now revealed as an epoch in which being as being withdrew itself. The emergence of the principle in the strong form of the *principium reddendae rationis* is seen as a change in the destiny of being, the release of the full might of the principle; but this release brings with it the complete eclipse of the possibility that the principle can be grasped as a 'Satz ins Sein' (leap into being) (SG, p. 98), and entails a still more decisive withdrawal of being as being.

The question 'whence speaks the demand of the ground for its delivery?' (SG, p. 100) also appears in a new light. What holds sway in this all-prevailing demand is 'the destiny of being in a previously unheard manner. . . . Thought first brings into view the essence of being in the extremest withdrawal of being' (SG, p. 101). The leap which places us on the way to an exploration of the 'place' of the principle of reason is a leap away from a region which can now be surveyed from the distance this leap has accorded (SG, p. 107). Then the destiny and withdrawal of being comes into view: 'being destines itself to us in withdrawing itself' (SG, p. 108), that is 'being turns to us comfortingly and becomes clear and in this becoming clear grants the temporal space of play in which beings can appear' (SG, p. 109).

Heidegger sees the historical necessity of Kant's leap or of his own as dependent on the ways in which being grants itself from epoch to epoch. Similarly, 'it would be foolish to say that the medieval theologians misunderstood Aristotle; rather, they understood him differently, in accord with the different way in which being granted itself to them' (SG, p. 136). Such language is defensible only if the successive grantings of being are in each case rigorously demonstrated by phenomenological studies of characteristic thinkers of the epoch. That would demand a tentative and open-ended quality to the characterization of the epochs. Heidegger's language seems to posit at the heart of each epoch a single founding event, a granting-cum-withdrawing of being, which shapes and gives unity to the whole epoch. A more open-ended and tentative account of the shifting ontological sensibilities of the West could have increased the phenomenological power of Heidegger's analyses while dismantling the eschatological myth in which he wraps them. His benchmark identifications and discriminations of the characteristic phenomenological upshot of various styles of thinking are caricatures when they shift from the register of description to that of prescription, when instead of noting that Plato tends to think being as *eidos* he goes on to pronounce that Plato cannot think being except as *eidos*, or when instead of noting that

the modern age tends to grasp being as objecthood for the subjectivity of reason (*SG*, p. 138) he makes this the sole central truth of the modern age, its very being.

The history of being depends on a definitive grasp of the essential nature of the mittence of being characteristic of successive epochs. This is an impossibly rigid expectation, which omits all the diversity of the interpretations to which every great thinker is exposed. However the strictly phenomenological focus of Heidegger's account reduces the scandal of his historical essentialism. Heidegger's governing phenomenological inquiry to the great metaphysical systems is not the merely preliminary one: 'What is the texture and structure of the thinking afoot here?' but rather: 'How stands it with being?' (*GA* 40, p. 36). The sequence of the answers to this inquiry forms the 'history of being', and provides a solid enough phenomenological core to this theorem, to which the critique developed by Habermas and others fails to do justice.

The historical picture of a progressive withdrawal of being and forgottenness of being is a stylization rendered implausible by its suggestions of the mythic. Yet no other language seems to Heidegger to capture the phenomenological essence of the process of forgetting of being. The notion that metaphysics has reached its culmination and its end in German idealism (*SG*, p. 114) and in technology also seems to need demythification, which would entail reducing the grandiose project of 'overcoming metaphysics' to the modest one of a critical questioning of metaphysical tradition in view of its occlusions; the massive opposition of metaphysics and the thinking of being as being could similarly be broken down into a series of local critical engagements. Finally, instead of awaiting an eschatological turn-about in which 'being as such awakens in such guise that it gazes at us from its awakened essence' (*SG*, p. 97), thinking should attend to the great variety of modes in which one is addressed by being, none of which can be established as pure or definitive or as a historical moment of arrival. We can practise Heidegger's art of listening all the better if we abandon his hope of picking up pure signals of being.

'The history of Western thought rests in the destiny of being. That, however, in which something else rests must itself be rest' (*SG*, p. 143), that is, the gathering of movement. Not only is each epoch unified by its central principle as identified by the historian of being, but the entire history is unified by reference to being itself whose destining presides over it. One's doubts redouble at this further leap to a position of such extreme generality which totally eludes verification or falsification. That the history of thought rests in the destinings of being, Heidegger insists, is not a mere opinion, but is received from being. A partial verification can be found in our subservience to the claim of the principle of reason (including its transcendental and dialectical forms) and the withdrawal

of being that corresponds to this. We stand in the clearing of being as those taken into the claim of the being of beings; we find ourselves caught up in a project of being (*SG*, p. 146).

'Through the fact that the being of beings grants itself as the objecthood of objects the destiny of being brings itself to a previously unheard of decisiveness and exclusiveness' (*SG*, p. 149) to which corresponds 'the most extreme withdrawal of being' (*SG*, p. 150). This continues to beg the question. Heidegger makes much of the indefinability of being, though insisting that we understand somehow the sense of the words 'being' and 'is' (*SG*, pp. 153-5). But his theory of the history of being has given concrete determinations to the notion of being that seem to have little to do with the everyday phenomenon of being. Withdrawal (*Entzug*) may indeed characterize the phenomenon of being, but a historical sequence of grantings and withdrawals introduces elements into the notion of being that quite clutter and distort its phenomenality. That being somehow is, one quite recognizes, but that it somehow acts, in an ordered sequence, seems a drift into inappropriate categories.

Philosophical thinking moves from 'what is more manifest to us' to 'what is more manifest in itself' (Aristotle, *SG*, p. 112). But its stylization as one from beings to being as such is only one of the possible languages that can serve as vehicle and stimulus of this movement. Sankara's movement from atman to Brahman or Nagarjuna's from conventional truth to absolute truth or Lao-tse's from things to void cannot be reduced to the ontological schema nor is the converse reduction possible. This plurality of paths must limit the bearing of Heidegger's sketch of the history of being. Moreover, it leaves open alternative perspectives on the history of Western thought, notably those which can be constructed in the light of the biblical heritage and its influence. Jewish and Christian constructions of history have been even more myth-bound than Hegel's and Heidegger's (which are in part a sublation of those constructions): the conflict of myths reveals history as a battlefield of warring interpretations; acceptance of this pluralism opens a new conversation about history, as an open field of possibilities rather than the cumulative realization of a pattern. This conversation is oriented by concern for the future rather than desire to conquer the past.

The questionable nexus

1 The leap of thinking

In the discussion of Leibniz in the first lectures (broken off at *SG*, p. 81), Heidegger engages quite firmly the conceptual and argumentative texture of metaphysical thinking. The core of Heidegger's thinking is phenomenological, going behind or beyond the level of thinking to which con-

cepts and arguments belong. Yet unless it engages with concepts and arguments the strength of such phenomenological thinking cannot be demonstrated. At a certain point, however – with the introduction of Angelus Silesius' rose (*SG*, p. 68), the emergence of the second accentuation, 'nothing *is* without ground' (*SG*, p. 75), and the 'leap of thinking' concealed in this abrupt change of accent (*SG*, p. 95) – Heidegger forsakes such critical argumentation as he listens for what lies unthought in the principle of reason, the way in which being announces itself as ground. It is here that the central rift in Heidegger's thinking comes into view.

Does he at this point fall away from this concentrated interrogation of Leibniz into a pot-pourri of his favourite myths and dogmas? This danger certainly looms and Heidegger himself shows an awareness of it in the care with which he maps out the implications of the leap, going back over earlier questions from the new vantage it yields. As Greisch remarks:

The operation of detachment which permits the transition to the other way of thinking paradoxically appears as both simple and complex. It is simple, for all that is asked is the performance of a 'leap of thinking.' It is complex, for this leap itself has to be thought.¹⁸

It is on this leap that his thinking stands or falls. Heidegger has certainly put his best foot forward on this occasion, dramatizing the event of the leap with great art, shoring it up with sober and persuasive reflections, and finding felicitous words to speak of its strangeness, its necessity, the freedom it yields, the landscape it opens up. If the leap were simply a leap away from reason it might not be easy to argue with Heidegger, though it would be easy to dismiss him. But the leap is a leap to the ground of reason. Not however to a metaphysical ground, but to an apprehension of the phenomenological essence of truth to which reason belongs, in which reason finds its dwelling, its home. However, though *Der Satz vom Grund* approaches it via the notion of being as ground, the goal of Heidegger's thinking back is not adequately named by this expression: the *Ereignis* which grants being is rather to be thought of as a phenomenological focusing of the truth of being. To see Heidegger as tracing 'a return back into the ground, the origin' (*ZSD*, p. 33) is a misreading of his thought according to the metaphysical pattern.

The leap of thinking is not a leap away but a leap home to the *Ereignis* in which being and thinking fundamentally belong. Just this claim conceals, I suspect, the central weakness of Heidegger's thought. The questionable stylization of the metaphysical tradition we have queried in the previous section is motivated by a vision of reason, metaphysics, as a derivation from and a decline from originary contemplative thinking.

Whenever Heidegger tries to explain how metaphysical notions arose on the basis of the forgetting of this originary domain there is an unconvincing gap in the account. Its two ends don't meet. Conversely, whenever he vaults beyond reason to the region of thinking his feat of transcendence fails to exemplify the status he claims for it. It is not a leap back to the ground, the origin, but rather a leap elsewhere, related to the rational tradition only in an oblique, marginal or tangential way. Heidegger has attained a realm from which the tradition of metaphysics can be questioned and helped to open itself to its phenomenological context – which is far richer than Heidegger is prepared to envisage, so rich that it eludes the control of the thinker of being just as much as that of the metaphysician. Heidegger has not attained a vantage point from which the history of metaphysics can be controlled and mastered in its 'essence'. Rather, reason and its processes maintain their autonomy alongside and in tension with contemplative thinking. Nor can the thinking of being pretend to have such privileged insight into the essence of these processes that it knows what scientists and logicians are doing in advance of any study of their work. Rather than seeing reason as a 'stiff-necked adversary'¹⁹ to be overcome, thinking had best acquire a sense of its own limits, recognizing that if its privilege is to attend to things that elude the mastery of reason, reason's privilege is to penetrate where poetic thinking can never follow.

Heidegger has allowed its full force to the Leibnizian principle, never contesting its claim, yet slowly negotiating a space of freedom beyond the grasp of the principle, a space in which Christian theologians will surely find an occasion to rediscover divine freedom as well. Having led us into the darkest secrets of the atomic age by his musings on the might of the principle of reason, he suddenly produces a poem about a rose: 'The rose is without why; it blossoms, since it blossoms, attends not to itself, asks not if it is seen' (SG, p. 68). This introduces the turn (*Kehre*) in the argument, the step back or the leap away from the dominance of 'why' to the granting of ground indicated by the word 'since'. 'Why' seeks the ground; 'since' provides a ground, in a new sense (SG, p. 70). 'Between the blossoming of the rose and the ground of its blossoming there intervenes no attending to grounds, whereby the grounds could first come to be *as* grounds' (SG, p. 71).

Is Heidegger eluding the principle whose power he has so eloquently evoked? Or does he rather allow the principle its unrestricted sway, while indicating its inherent limits (which correspond with the limits of metaphysical reasoning): no being can be without a ground, yet this does not begin to exhaust the phenomenality of a being. 'The principle is valid *of* but not *for* the rose; of the rose in so far as it is an object [*Gegenstand*] of our representation; not for the rose in so far as the latter stands in itself, is simply rose' (SG, p. 73).

Being is given; it is the ground of beings in a sense that is missed if we busily go in search of their grounds. The question 'why' puts the ground at a distance; the answer 'since' reveals its nearness. The rose's avoidance of the principle of reason and its provision of ground in a different sense reveals that 'The principle of ground [in its first accentuation] says *nothing about the ground*' (SG, p. 75) and prompts us to listen to it in the second accentuation, which indicates *being and ground* as imponderables lurking in the apparently so transparent principle.

'*The principle of ground, understood in the usual way, is not a statement about the ground but about a being in so far as it is in each case a being*' (SG, p. 82). This discovery brings us into 'a critical zone of thought' (SG, p. 84) where every step exposes us to errance. The principle now says: '*To being belongs something such as ground. Being is groundlike, ground-ish. . . . Being deploys its essence in itself as grounding*' (SG, p. 90).²⁰ 'Being "is" in its essence: ground. Therefore being can never now first have a ground, which would ground it' (SG, p. 93). This independence of ground makes being the *Ab-Grund* ('abyss'). What is the accord between these two propositions: 'Being and ground: the same. Being: the *Ab-grund*' (SG, p. 93)?

2 Can thinking ground reason?

In naming being as a ground that does not need to be further grounded has Heidegger resolved the riddle of the principle of reason? The faulty nexus between thinking and reason in Heidegger can be discerned in the unbridged gap between ground in the normal logical and metaphysical sense and being-as-ground. Similarly, what is called 'truth', 'error', 'being', 'nothingness', 'identity', 'difference', '*logos*', at the level of the thinking of being has but an equivocal relationship to what these terms denote in metaphysical discourse. To begin with they have a plurality of senses in their use in metaphysical argument, as in everyday usage, whereas Heidegger adheres to a univocal sense for each of these terms and so can discourse freely on their 'essence'.

It may be that, starting from a particular example of 'truth' or 'ground' in a particular context, one can think back to the more essential depths of the phenomenon which thus comes into view. But the paths of such thinking back do not converge in a single bourne – the region of the *Ereignis*. They are trails of exploration as diverse as the styles of artistic creation or of religious imagination. A single unifying idea fails to impose itself. The big words, the transcendentals – being, good, beauty, ground – are only gasps before the immensity of things. Nor is 'God' a unified concept. The meaning of the word is inherently, thoroughly, contextual, as is the meaning of the word 'being'. There are contexts in which neither word has any meaning and in which the universal features of 'everyday understanding of being' or sense of the absolute have deployed and

dispersed themselves in quite different verbal universes. When people ring the changes on 'God' and 'being' they are doubly blinding themselves against the pluralism of the stories through which humans create and explore their worlds. The 'God' that is dead is the univocal God; language about God retains its sense as a constantly self-correcting, self-renewing language, variant from culture to culture, from context to context, changing at its margins into other varieties of religious language, such as language about the absolute, emptiness or the Tao.

It may be that the basic tenet of the phenomenality of being is based on a misappropriation of Husserl's categorial intuition; gradually it becomes apparent that the major phenomenological *Sache* for Heidegger is not being but world, the open realm of manifestation. The forgetfulness of world in the natural attitude (everydayness) or in metaphysical world-constructions cannot be translated directly into an oblivion of being as being. The two lines of criticism fall apart and the latter is never given a firm phenomenological content.²¹ But Heidegger might accept that the phenomenon which conceals itself in the presence of being can be called 'world' just as well as 'being'. Descombes notes the 'defect of construction'²² of the question of being which he sees as condemning Heidegger's search for the unthought-of Western metaphysics to remain a pipe dream.

But do these criticisms rest on a careful consideration of Heidegger's development of a 'phenomenology of the unapparent' (*GA*, p. 15)?²³ What Descombes proposes instead is merely the 'ontological clarification of the presuppositions of an epoch'.²⁴ But this remains on the level of conceptual thinking, affords little scope for the liberating leap to a contemplation of the *Sache selbst*. How does one explicate the ontological implications of a poem? Whatever the inadequacies of Heidegger's commentaries, they have opened up a meditation on the essence of literature – in Maurice Blanchot for example – which can never be recalled to the platitude Descombes recommends, which risks being absorbed by the 'cybernetic' (*ZSD*, p. 64). 'The dialogue of thinking with poetry is long. It has scarcely begun' (*GA* 12, p. 34). Heidegger's meditative thinking has an autonomy and a strength which is independent of his constructions of being and its history. Beneath all great philosophical utterances lies a fathomless unthought and Heidegger is the one thinker who has provided us with a compass for exploring that dimension. The aporias of his thought are a challenge to pursue its project along new lines.

Heidegger's search for originary phenomenological senses of 'being' and 'true' is in tension with the emergence of non-phenomenological senses in ancient Greece contemporaneously with scientific and philosophical thinking. Being, within metaphysics, figures as ground, in a sense that is not primarily phenomenological (see *ZSD*, pp. 2, 36–7), and that cannot be reduced to the phenomenological (as *Der Satz vom Grund* seems to attempt). Even at the humble everyday level from which

both types of discourse begin, there is a gulf between the phenomenological sense of being as presence and the logical functioning of the word 'to be'. If one says: 'it is true that three and three are six' one has to draw on senses of 'to be' and 'true' that are autonomous in regard to such phenomenological matters as presence and concealment. These senses of being and truth neither transcend nor fall short of the phenomenological senses. They are simply other.

The fusion of the copulative, existential and veritative senses of 'is' constitutes a grammatical mistake. The effort to hold them together in a unitative way under the rubric of the *pollachos legetai* does not work phenomenologically – it forces Heidegger to gloss over the 'wonder' of the veritative sense ('it is' = 'it is true') and dismiss it as mere correctness (*Richtigkeit*) or as simply 'ontic'. The veritative sense can be brought into view phenomenologically only as something that gives the slip to phenomenology. Faced with the fact that some simple utterance – 'Caesar crossed the Rubicon' – is true and not false, phenomenology finds it has nothing to say, whereas reason may find here a starting point for deep metaphysical probings. Conversely, the sense of being as presence, of truth as unconcealment, eludes the kind of reasoning that deals in logical and factual truths. This mutual eluding of the phenomenological and the rational, neither of which can ground the other, is a situation no more enigmatic than the mutual eluding of, say, chemistry and music. We do not have a world-formula that can reveal these various perspectives unfolding from a single unitary instance.

Thinking of being does not succeed as 'an endeavour which brings the essence of metaphysics to the fore and thereby brings it within its limits for the first time' in view of an 'originary appropriation' of the metaphysical tradition (*GA* 12, pp. 103–4). Thinking can open up new realms but it is not qualified to declare a closure on the range of reason.

3 The supremacy of play

What grounds a being is nothing that can be cast in the form of a rational account, but is the donation of its presence from the event of being. This grounding phenomenon loves to conceal itself: 'Being conceals itself as being, namely in its initial destinal belonging-together with the ground as logos. . . . As it conceals its essence, being allows something else to come to the fore, namely the ground in the form of *archai*, *aitiai*, *rationes*, *causae*, principles, causes and rational grounds' (*SG*, p. 183) to all of which attaches a character of self-evidence that masks their forgotten origin. Being can now no longer be explained by reference to a ground; as grounding it is itself groundless; so to thought remains the duty of corresponding to the measure of being, not by any unsuitable procedures of reckoning or measuring, but by thinking being as being (*SG*, p. 185). To think thus is to be drawn into the play of the world, a play 'without

why'. 'Being as ground has no ground, plays as the non-ground, abyss, of that play which as a destiny plays to us being and ground' (*SG*, p. 188). The cryptic conclusions demand to be supplemented by Heidegger's discussions of Heraclitus in *GA* 55 (cf. *VA*, pp. 207–29; *GA* 15, pp. 9–226).

A question remains, as with all Heidegger's reductions of metaphysical principles to pre-metaphysical openings of being: does the principle of sufficient reason really derive from the play of the world? Does reason not have an autonomous force independent of the aesthetics of play? Has Heidegger in his step back really restored metaphysics to its forgotten essence, or has he lost it from view? Is the emergence of the principle of reason governed by a destining of being, that is by a phenomenological instance of manifestation and withdrawal, or does it emerge like the laws of mathematics and logic through a process of thinking which cannot be brought under the aegis of the phenomenological? Does the principle of reason cast the truth of being in the shade by its very nature or only because it is applied ruthlessly in matters where it cannot be normative or adequate?

Some later texts (*Zur Sache des Denkens*) may show a willingness to let metaphysics go its own way, as the effort to ground scientific reason in the most strenuous reflection possible, and to abandon the effort to found such rationality in the contemplative attention to the phenomenality of being. Scientific philosophy may be one of those 'sieves which let through only quite particular aspects of the matter' (*GA* 55, p. 229) – but the same may be equally true of contemplative thinking. When Heidegger claims that only *Seinsdenken* grasps the truth of what is and that it has an essentiality and radicality from which merely rational thinking is barred by its very constitution, is he not in fact appealing to a form of that absolutism which he so often undermines in the work of his predecessors? To be sure, mystics and Zen masters depreciate the devices of reason in a similar style, but do they go so far as to claim that all rationality derives ultimately from Zen or mystic insight? It is this extra claim that allows Heidegger to take his place among the great metaphysicians. But the step back to 'thinking' may exact the relinquishment of any claim to such a place. To have retrieved the contemplative dimension of philosophy is enough; it is exorbitant to claim to have retrieved the foundation of its rational dimension as well. If reason marches on, oblivious of Heidegger's intervention, that is not necessarily a great tragedy. The thinker of being like the mystic can perhaps flourish only in marginality. Sufficient to have planted seeds of reflection which may have here and there a greening effect on the landscape of science and philosophy (cf. *ID*, p. 67). His thought, attuned to the one thing necessary, may afford a place of retreat when one tires of the struggle to grasp the world by reason. But it does not seem that its

role is to criticize and direct the operations of reason. Its relation to them can only be an oblique one.

There is a version of reason which reduces the being of beings to what can be mastered by concepts and definitions. 'Now this easy intelligibility becomes the standard for what obtains or can obtain, and that now means for what may be or be called a being' (GA 65, p. 336). Reason which makes itself small makes reality small as well. If there are occasions on which metaphysical, logical and scientific reason must reassert its dignity over against Heidegger's depreciation, it is also a mark of true rationality to recognize the value of Heidegger's mapping of the margins of the rational. If in his attempt to restore reason to its fuller context, Heidegger tended to bring philosophy down the blind alley of a pure thinking of the phenomenon of being, none the less he struck out on paths that free reason from a self-ideal of dispassionate objectivity, giving it a more contextual and participatory notion of its own operations. Conscious of the presence of *Seinsdenken* as its other, reason moves more humbly and more soberly, instead of chattering loudly in self-obsessed arrogance; the effect is similar to that produced on Christianity by an awareness of its coexistence with Judaism and Buddhism.

Pluralism at the origin

1 The deconstructive opening-up of Heidegger

Derrida undoes Heidegger's essentialism by focusing on the fact that Heidegger uncovers the originary as 'different', as inherently other, thus unsettling the grounding and founding movement of his return to the essence. For the essence as Heidegger locates it is always marked by heterogeneity in regard to that of which it is the essence – the essence of technology is not anything technological, the essence of truth is non-truth, being comes into view as non-being. Derrida characterizes Heidegger's 'powerful thinking repetition' as 'a retreat or an advance towards the most originary, the pre-archi-originary which thinks . . . no other content than that which is there, be it as the promise of the future, in the heritage of metaphysics'.²⁵ In thus bringing being into view – as given and possibilized from out the e-vent of being (ZSD, p. 8) – Heidegger invents a new sense of the originary, one which is *hétérogène à l'origine*, heterogeneous to anything metaphysics think of as origin, not a *fundamentum inconcessum* but one which is *concussum* (ZSD, p. 34), one which always reveals itself as other, as a rift. It looks then as if Heidegger himself is aware of the questionability of his claim to ground metaphysics in the thinking of being, and that the grounding progressively turns into its opposite, an ungrounding, an uncovering of irreducible enigma at the heart of the basic notions of metaphysics throughout its history.

Yet for Heidegger enigma retains a quiet authority that teases us out of thought. It is the essential heart of things, and remains immune to pluralistic dissemination. Ludic and an-archic readings of Heidegger, such as those of Caputo and Reiner Schürmann²⁶ may find much to nourish them in the final pages of *Der Satz vom Grund* which create a sense that we have moved from a prison to a playground; but such readings miss the degree to which the *Logos* – however enigmatic it has become – remains a principle, an essence, a unifying factor; only as such does it retain the quiet power that can overcome the might of the principle of reason.

Whither leaps the leap away, when it leaps away from the ground? Does it leap into an abyss? Yes, in so far as we only think of the leap and in the field of vision of metaphysical thinking at that. No, in so far as we leap and release ourselves. Whither? To the place into which we have already been released: in belonging to being. Being itself however belongs to us; for only with us can it be as being, that is, be present.

(ID, p. 20)

Being is abyss, *Ab-grund*, only because it is itself *Grund*, ground (SG, p. 185). The play of being is 'free of all arbitrariness' (SG, p. 186), so much so that Heidegger can retrieve in a new key Leibniz's 'Cum Deus calculat fit mundus' which he translates 'While God plays, world becomes' (SG, p. 186).

Caputo dilutes this sense of order when he writes:

There are no hidden comforts, no hidden assurances, no steadfast guarantees concealed in this play. The play has the improbability of a child at play and an uncertainty which is marked by the question ['whether and how, hearing the movements of this play, we play along with and join in the play' (SG, p. 188)].

There seems to be little uncertainty about the serene order of the play of being, as far as its essence is concerned, though our failure to participate may imperil its actualization. It is misleading to say that by our participation in the play we 'deny it rest and arrest' as Caputo goes on to say; metaphysics, as an arrest of thinking, is to be overcome, but thinking itself rests in the play of being. It has nothing of the arbitrary improbability of a game of chance. To say of the dominant epochal terms that 'there is no grounding of these elemental words' and 'they cannot lay claim to anything more than a certain historical aptness', a situation which is 'one of the most embarrassing things in the history of metaphysics', is to smuggle into Heidegger's thought something that it

conspicuously lacks: an emphasis on the contingent pluralism of the historical languages of metaphysics.

Heidegger's 'destinal formations' (*ID*, p. 58) replace Hegel's epochs and Nietzsche's theory that 'as the law [*Gesetzlichkeit*] of history nihilism unfolds a series of different stages and forms of itself' (*N II*, p. 279). Their sequence is not a chance one, though it is also not a necessary one (*ZSD*, p. 9). For Heidegger, the law underlying the nihilistic sequence of the mittences of being is the *Ereignis* which is their principle; thought of the *Ereignis* ends the history of being by recalling it to its source (*ZSD*, p. 44). 'The *Ereignis* is the law, in so far as it gathers mortals in the appropriation to their essence and keeps them therein' (*GA 12*, p. 248). It is the true *Grund*. The strangeness and otherness of this *Grund* which turns out to be an *Ab-grund* does not license Caputo's interpretation, that 'everything is caught up in a certain fortuitousness', nor his suggestion that 'television and advanced forms of communication will spread the message' . . . of the apocalypse without truth and revelation'.²⁷

Schürmann, who tries to think with Heidegger beyond Heidegger in seeing the movement to the *arche* as betraying an an-archic thrust, does not do justice to the primacy, strongly affirmed in Heidegger, of identity – the belonging together of being and thinking in the *Ereignis* – over difference. Far from being a differential pullulation the *Ereignis* is a gathering of things into their essence. Heidegger remains a traditional metaphysician to the degree that the *Ereignis* is the truth, the ground, the essence of all that is: It first dawned on him as a great revelation in the 1936–8 manuscript (*Beiträge zur Philosophie: Vom Ereignis*), which rather than being thought of as Heidegger's second masterpiece or even as his one true masterpiece (thus Otto Pöggeler in various publications) should rather be seen as the magma from which his masterly later writings were to emerge. It is clear that Heidegger is constructing a first philosophy:

The truth: ground as abyss [*Abgrund*]. Ground not: whence, but wherein in the sense of belonging. Abyss: as time-space [*Zeit-Raum*] of the struggle; the struggle as struggle of earth and world, since relation of truth to what-is! . . . [Truth] is the ground as what takes back and what pervades, which towers above the hidden without abolishing it; the affective tone which sounds as this ground. For this ground is the *Ereignis* itself as deployment of the essence of being.

(*GA 65*, p. 346)

The *Ereignis* is what lies at the heart of the simple there-isness of being, the '*il y a*' of one of Rimbaud's *Illuminations* (*ZSD*, pp. 42–3). Beings do not emerge into presence in the medium of flat objecthood nor of

Husserlian transcendental consciousness. Teasing at the mode of the givenness of being Heidegger moved beyond all former apprehensions of objectivity and subjectivity and came up with his own apprehension of the event of being, one which cannot be adequately expressed in propositions (ZSD, p. 25) but only in the visionary simplicity of the poetic word as found in the essential poets. And the heart of this word is a silence, which is inscrutable. The difference emergent here is of a contemplative order, which deconstructionism no less than metaphysical rationalism is quite incapable of espousing.

2 Mutual irrecoverability of faith and thinking

But it seems that in mapping the world according to the *Ereignis* Heidegger glossed over the pluralistic texture even of such contemplative simplicity, and hypostatized a unitary element in which all things fall into their proper place, in which the world worlds and the thing things according to their proper natures. Even the deconstructive version of the *Ereignis* as essentially difference, unless it is worked out in terms of a concrete pluralism, still risks projecting a unitary instance which undercuts all religions and philosophies as the unnameable other.

In some ways theologians are in a better position than philosophers when it comes to detecting the pluralistic texture of reality even at the depths involved here. Perhaps some theologians have identified their own radicality with that of Heidegger, misread in a still metaphysical sense, as Derrida suggests in the humorous closing pages of *De l'esprit*. The more alert, however, have stumbled on the differentiations inevitably emerging in any encounter between biblical thought and the thinking of being. The dialogue between Heidegger and the theologians does not converge on the celebration of a single bedrock reality, beneath being and Spirit alike. Rather it is an experience of difference, of a gulf between the radicality that proceeds from the metaphysical tradition of naming being and the biblical tradition of naming God (and there are other gulfs, notably with the Buddhist tradition of emptiness). When abyss speaks to abyss in this way, a relativization is inevitable.

Heidegger cannot be recuperated in a theological scheme, such as that which seeks in the *es gibt* the presence of the Creator who 'gives' beings (Maria Villela-Petit, *HQD*, p. 95). Such religious constructions spoil the integrity of the phenomenon, and are a failure to let being be being. The *Ereignis*, the granting of being, is a gracious event, a constant source of wonder; but the invocation of the Creator to provide that wonder with a ground seems only to undermine it, to rationalize it. Here then is a depth of which theology cannot speak. Conversely, the Bible cannot be recuperated in a Heideggerian scheme, despite his attempts to bring it under the rubric of the Sacred – and thus is broken the imperialism of the thinking of being. As both traditions realize their finitude the

question of an ultimate originary instance becomes more profoundly obscure. One can practise 'faith' and one can practise 'thinking of being'; the coexistence of the two practices can involve a greater or lesser degree of interaction. To claim the all-importance of one and the relative triviality of the other (as Heidegger presumed theologians would have to do) is a formula for fanaticism.

The hypothesis of a single unitary granting of being and world certainly provided a grand theme for phenomenology; but it seems destined to dissolve into acceptance of the infinite plurality of human worlds as historically constituted. One may talk of an abstract form of worldhood in general, but this is something far more tenuous than the richly furnished world on which Heidegger meditates. There is a biblical experience of world on the basis of a vivid sense of dependence on the Creator which is neither reducible to onto-theological ratiocination or assimilable to the Greek experience of world (Heidegger's alternative ways of dismissing it). A tension between different forms of the worlding of world, worked out in different cultures, may be constitutive of the post-modern experience of the worlding of world. Within each culture the way the world worlds is undergoing constant modification. There is then no step back from the technological world to a unitary experience of the fourfold, but only an opening-up to a great variety of ways of being-in-the-world. This variety blurs any unitary notion of the truth of being and any unitary notion of God. Philosophical and religious languages, like artistic and literary ones, multiply according to the laws of historical and cultural pluralism.

It is misguided to set up a Pascalian clash between the *Ereignis* and the God of Abraham (see *HQD*, pp. 172–3) since both 'God' and *Ereignis* are unstable notions that dissolve into a plurality of historically constructed contemplative perspectives. The dialogue of theology with Heidegger (or of the biblical with the philosophical tradition) is much like the dialogue with literature – it offers a great variety of points of encounter and a great variety of points of tension, much as any exchange between human beings does. The pluralistic coexistence of the thinking of faith and the thinking of being cannot be reduced to a simple pattern by the imposition of an approved Christian evaluation of Heidegger's thought or of an approved Heideggerian reading of Christian tradition. That is not to say that the dialogue will not occasion many firm judgments, both positive and negative; but the mutual solicitation is inherently open-ended, a space of thought whose contours cannot be rigidly demarcated – just as the contours of the encounter between Christianity and Platonism cannot be demarcated, even today.

3 For a general theory of pluralism

The acceptance of pluralism both in reason and in thinking does not invalidate the movement, the basic inspiration, of Heidegger's thought – the reaching back from convenient conceptual lucidities to the obscure wonder of the presence of things – but it diversifies this movement into a great variety of local and contextual paths of thinking. Each of these can be the critical overcoming of some form of blindness or forgetfulness and the bringing to light of some 'essential' phenomenon. Within the great religions such thinking back will try to renew the original impact of the revelation from which the tradition lives, but of course all such retrievals are recreations; even in the Pentateuch what a gulf there is between Deuteronomy and the earlier traditions it repeats! Any discipline may be inspired by the orientation of Heidegger's depth-hermeneutic of retrieval/recreation; thus his influence may extend as his doctrines wither.

Heidegger's insight into the *Ereignis* is not a pure intuition of essence. It is a cultural product, the fruit of an engagement with poetic and mystical traditions. Greisch finds a lack of coherence between the phenomenology of the *Ereignis* as simple, ineffable 'identity' – in which being and thinking (*Identität und Differenz*), or being and time (*Zur Sache des Denkens*), belong together – and the phenomenology of the carrying out (*Austrag*) of the difference between being and beings.²⁸ He suggests that the coherence can be found by pursuing the matter further, entering more fully into the simplicity of the *Ereignis* and leaving the question of the difference to metaphysics; but it seems the destiny of any phenomenology of 'world' or of 'being' to come undone in a pluralism of perspectives. The *Ereignis*, as 'the post-metaphysical name of the Pre-Socratic *aletheia*',²⁹ as 'the most unapparent of the unapparent, the simplest of the simple, the nearest of the near and the farthest of the far' (*GA* 12, p. 247) – and as too much else besides – is a rubric under which a variety of contemplative perspectives are forced into unity.

As for the next grand principle, the fourfold, subordinate to the *Ereignis* almost as the *Nous* is to the *One* in Plotinus, it, too, seems to patch together into a dreamlike unity phenomenological quantities that are more convincing when left separate – mortal *Dasein* as the 'there' of being, and the struggle between the concealment of earth and the openness of world, make perfect sense in certain particular contexts, but the gracious dance of earth, sky ('world' in the first version, *GA* 65, p. 310), mortals and gods is just pleasantly poetic; can one believe that it lights up a structure at the heart of things, one of universal import? Had Heidegger attended more to the particularity of the worlds of his poets (instead of fusing them into a single phenomenological amalgam dominated by Hölderlin – as Heidegger interpreted him) he would have relinquished the search for a unified phenomenology of world, as Paul Ricoeur

in *Time and Narrative* relinquishes the search for a unitary phenomenology of time. Or at least he would have been more prudent in expounding the form of the phenomenality of world, refraining from giving it such charged concrete content. To justify the identification of being with world Heidegger has to posit that being is always manifest in a time-space, as the 'abode of the moment [*Augenblicksstätte*] for the founding of the truth of being' (GA 65, p. 323), a moment of destiny in which the space of history is concentrated.

4 The theological leap to a pluralism of origins

Theological imitations of Kant's transcendental leap ground Christian revelation in a metaphysics of human spirit opening onto the divine; they remain within the realm of subjectivity, subjectivity not in the sense of subjectivism but as 'the essential law-character of the grounds which sufficiently provide the possibility of an object' (SG, p. 137). This, too, must be relinquished in the thinking leap to the truth of revelation (this phrase, too, is shorthand for a variety of contemplative perspectives), a leap which can only happen as a response to the call and claim of the divine Word. Barth is the one who has succeeded best in such a naming of the essence of Christianity, eclipsing the previous efforts of Schleiermacher, Feuerbach or Harnack. What is lacking in Barth is the pluralism which opens the truth of revelation to the truth of the other 'great beginnings' in the religious sphere.

What is the element in which the great beginnings can encounter one another? Is it the element of being? Of Buddhist emptiness? Of the biblical Holy Spirit? Of dialogue? Of an ethos of liberation? It is not, at least, any of the metaphysical elements that have been proposed as the ground of theology: the transcendental consciousness of Rahner, the Hegelian realm of spirit, the Whiteheadian realm of process, or the older Augustinian and Thomist ontologies. Nor is it the kerygmatic-existential element of Kierkegaard, Barth or Bultmann, for this demands to be released from its narrow isolation and exposed to the wider sweep of religious and human reality. Nor is it any discourse that savours of old ecclesiastical wineskins. Great as are the historical constructions of the churches, they appear in the light of the present interreligious horizon far too shrivelled and sectarian to serve as vehicles of spirit. They, too, are to be overcome.

The dimension towards which we must think is one in which all the great religious texts can speak their essential truths with the maximum resonances. It must be pneumatic, 'empty', liberational, dialogal in the strong sense of mutual solicitation. Only so can it allow the essence of religion to be released from its counter-essence of sectarianism, intolerance, fanaticism, fundamentalist sclerosis. What is the unifying element in which these qualities can flourish? These qualities are not ahistorical

attributes. They emerge with a special force at this specific historical moment in a conversion away from sectarian traditions, in a movement of expropriation that brings us into a new communality. How name this process? Just as the new realm of the thinkable opened up by Heidegger's leap can be discerned only in light of the previous history of thinking, now seen for the first time as a destining of being, so the new realm opening up in religious awareness can be grasped only in a critical retrieval of religious traditions as happenings of revelation, happenings always intrinsically pluralistic and open-ended.

5 God as Creator in a pluralist perspective

Heidegger raged throughout the thirties and forties against the reduction of beings to 'products' which the belief in a creator brought about.³⁰ Jean Beufret objected to the monopoly enjoyed by God in the Christian view of being:

In the beginning God created, or rather created for himself, the heavens and the earth and finally his man. Everything is there, Heidegger says: the earth, the heavens, humans, the God – except the essential. . . . For in the scriptural narrative three of the four depend on a *Primus* who is their origin and their centre as well. In place of the divine priority or primacy, Heidegger names a Fourfold or rather *Uni*-fourfold of which the centre is none of the four.

(HQD, pp. 28–9)

The centre of the Fourfold is the holy as the chaos which yawns.

K. Rosenthal remarks that 'the subordination of the God or the gods to chaos is the contrary of what is intended in the creation narrative'.³¹ But Beaufret points out that Heidegger is using the term 'chaos' in a special sense 'in the closest connection with an originary interpretation of the essence of *aletheia*, as the bottomless as it initially opens up' (*NI*, p. 350) the Open as it first opens to bring everything into its grasp, to accord to each differentiated being its presence within limits. (Michel Haar points out that Hölderlin only once uses 'the holy' as a substantive and that 'the idea of a genesis of the gods from the Sacred is visibly unilateral and excessive'.³²)

Jean-Luc Marion sees here an idolatry of being and the sacred as a screen against the sovereignty of God (HQD, pp. 60–6). Maria Villela-Petit defends Heidegger on the grounds that in the Bible God appears as a being, so that the experience of God depends on a prior experience of being (HQD, pp. 91–2). Heidegger does not present being as the ground for God but as the space in which God is encountered (HQD, p. 94). He is clearing the space for a renewed encounter with God, though his way of putting this is highly misleading, e.g. 'the divinity as

it deploys its essence receives its origin from the truth of being' (GA 13, p. 154). One might add that Marion's project of thinking God as love 'outside' the question of being, and his dismissal of the play of being as mere inanity, could undercut the human basis for a full-blooded encounter with the divine. His Pascalian gesture of putting being at a distance – the distance measured and granted by the Cross – seems phenomenologically tenuous. But the entire framework of this debate is undercut if we register the historical texture both of the scriptural language of creation and the Heideggerian language of being.

Marion intends to verify this Pascalian subordination of the order of being to the order of charity on the purely philosophical plane through a phenomenology of love. One gathers that love will continue to let being play, but will judge its play to be 'inane'. Pascalian *ennui*, in its indifference to beings, 'suspends the claim of being and by that very fact confirms that the claim precedes being and alone makes it possible. The pure form of the call comes into play before any specification, even of being.' This is rather dizzyingly rarefied; in prising the claim structure apart from being and siting it 'beyond being' is Marion making an apologetic attempt to discern the presence of a Creator through a depreciation of being? In ascribing such powers to *ennui* Marion seems to betray a notion of being as a projection of Dasein, a quasi-idealistic understanding from which Heidegger increasingly distanced himself, and to miss the simplicity and undeniability of the *es gibt*.³³

Dasein's refusal to hear the call of being reveals a new existential, 'a counter-existential, which suspends Dasein's state of being destined to being' to which corresponds 'a new abyss, anterior, or at least irreducible, to being', namely 'the pure form of the call' which is the unrecognized condition of possibility of Heidegger's call of being. Here it seems that a unitary logic that insists on the primacy of a single principle, whether being, or the call in general, or love, or the other, or God, suppresses the plurality of forms which each of these take and the ample room for interaction between them. Is not the human being always addressed by many calls, irreducible in their variety: the quiet call of being, the urgent call of duty, the cry of the oppressed, the lure of the beautiful; this variety of calls is found within the biblical kerygma alone – which is not exhausted by the 'Hear, O Israel!' of Deuteronomy 6.4.³⁴

A more originary language of faith is not to be constructed from a general unitary form – whether the *Ereignis* or the pure form of the call or the Word of God. It can emerge only from a plunge into the concrete texture of the world of faith, both in its past sources and its present enactments. One might distil pure forms of logic or ontology independently of the complexities of the metaphysical tradition, but there are no such pure forms in the world of faith, because that world is not a unitary realm. There is no eidetic science of the religious, either to be

read off from a privileged tradition (the form of love from Christianity, the form of spiritual liberation from Buddhism), or to be constructed a priori and later filled with concrete content. In this respect faith is more like art or literature than like ontology or logic.

Not only does Christian identity vary from epoch to epoch and from culture to culture but it is constitutionally dependent on its others: the question what Christian faith is cannot be thought through to the end without an ongoing reference to Judaism, Islam, modern secularism, Hinduism, Buddhism. This means that the question is never fully thought out. Christian faith remains an open-ended project, intersecting with many other open-ended projects. God is revealed and is at work in Christianity, but not in such a way as to curtail or disrupt its dialogal dependence on the other traditions that coexist with it; and by Christian principles God is revealed and at work in all those other traditions as well. Christianity is far more a diachronic adventure than a synchronic system of tenets. The involvement with metaphysics is an important part of this story, which cannot be undone by a single leap elsewhere. It is a story to be told and retold, therapeutically. Its significance cannot be encapsulated in a single definitive *Wesensschau*.

These remarks may apply also to Levinas's reduction of ontology to a prior foundation in the claim of the other person (*HQD*, pp. 238–47). That claim seems to arise in an ontological desert – to the point that being lacks the certainty of its 'justification', which it can find only by attending to the moral claim which alone is ultimately or originally significant. But a quarrel of precedence between ethics and ontology supposes that both are grasped as unitary instances. The radical pluralism to which the ethical tear in the texture of ontology points is missed when one talks of grounding ontology in ethics. This unconvincing hierarchy of grounding relationships – metaphysics founded on *Seinsdenken* founded on the ethical – must yield to a pluralistic autonomy of all three instances, each an end in itself, or rather, each a language in itself, intersecting the others richly, but not in a way that admits a synthetic concord of the three languages. There is a touch of absolutism in the refusal of Heidegger, Levinas and Marion to entertain such a possibility. Heidegger does dally with it a little, in leaving the relation of his thought to theology and to 'the other great beginnings' open-ended; but usually only to quickly add the Parmenidean warning that whatever is 'comes to pass in the dimension of being' (*GA* 15, p. 437).

To set this dimension against the creation-perspective is to be deceived by abstractions. If one lets both languages melt back into their historical contexts, it may be found that both have valuable functions, but that neither can serve as an all-purpose explication of the world. Unless this is done each style of thought is doomed to wage iconoclastic war against the other. Thus Beaufret has to repress the biblical Creator: the music

of Bach, though used to celebrate the divine primacy, 'speaks of the relation of the divine to the Uni-fourfold rather than of its isolation as supremacy over the rest of what is'. 'Being in the Greek sense opens no possible access to the God of the Bible, but to a "theology" completely other than that of the Creator of heaven and earth' (*HQD*, pp. 31, 34). Heidegger tries to bring Christ, the prophets and the Holy Spirit under the aegis of a Hellenic and Hölderlinian notion of the sacred (*VA*, p. 183). This effort to grasp the biblical in terms of the fourfold never succeeds; it is felt to be the imposition of an idolatrous screen cutting short the movement of faith which the phenomena evoke. But the converse imposition of the creation-perspective on other poetic apprehensions of nature may equally lack phenomenological justice.

Michael Zimmerman makes a suggestion which Heidegger himself does not explicitly rule out:³⁵

Does this conception of God exhaust the Jewish tradition of the Creator? Or does the Jewish tradition have a non-productionist, non-metaphysical experience of God, one that was 'corrupted' at the hands of St. Paul, St. John and other early Christians influenced by Greek metaphysics, especially Platonism? If the Jewish God may be construed as non-metaphysical, then perhaps there is *another* possibility for renewing the West: an originary encounter with the God of the Old Testament.³⁶

One should add: an originary encounter with the God of St Paul and St John, who is essentially Spirit, and only to a minor degree shaped by Hellenistic conceptions; and indeed with the God of Christian faith of all periods, who is always in tension with the metaphysical constructions of his nature. 'Lift up your eyes on high and see: who created these? He who brings out their host by number, calling them all by name' (Isaiah 40.26, RSV). In such texts the event of creation (of absolute divine Lordship) is in resonance with the election and liberation of Israel and the confounding of the might of the nations and their false gods. There are many other traditional ways of imagining creation, each of which deserves close literary and phenomenological study. None of them are simply reducible to productionism, not even the Johannine 'all things were made [*egeneto*] through him' (John 1.3) or the Pauline 'since the creation of the world his invisible nature . . . has been clearly perceived in the things that have been made' (Romans 1.20), though in this latter text a Greek metaphysical component is undeniable.

The rhetoric of Creation seems to license talk of God as ground, usually in a sense that would be more pleasing to Samuel Clarke than to Leibniz; but closer phenomenological analysis of it may show that it frustrates the quest for grounds. The multiplicity of ways of conceiving

the Creator dissolves the unitary notion of ground into a plurality of projections of the absolute or the supreme real. Our thought, our faith, are drawn toward this realm, but can never reach a point of arrest; they reach out into the plurality of the mystery as art reaches out. It turns out that the inherited conceptions of God are only starting-points in the dialogue about that reality to which talk of God points, a reality that can henceforth be explored only in dialogue with Buddhism. That reality is in some sense 'grounding' but how this is to be said and thought remains more than ever an open question.

2 See Jean-Luc Petit's discussion of this pluralism for the category of action in *L'Action dans la philosophie analytique* (Paris: Presses Universitaires de France, 1990).

3 Jean Greisch, in his contribution to these volumes, seems to confine Heidegger's attempt to revision metaphysics to the period from 1928 to 1936, but the programmatic text he quotes (*GA* 65, p. 176) looks forward as well as backward. Even if the thought of the *Ereignis* became a higher priority, pursued independently of metaphysics, Heidegger never ceased to return to the question of the essence of metaphysics.

4 Heidegger already begins to reduce the variety of historical discourse on causes and grounds to a single monolithic 'essence of ground' when he attempts to discover what unites the four *aitiai* of Aristotle (*GA* 9, pp. 124–5, 273–94). He describes a variant Aristotelian set as 'four manners of possible grounding, laying and giving of ground: essence, cause, argument (in the sense of: "a truth"), motive' (*GA* 26, p. 137). Ute Guzzoni has criticized this too unitary and dynamic account which apprehends the *aitiai* under the rubric of production (*Herstellen*), which was not Aristotle's concern (*Grund und Allgemeinheit* (Meisenheim: Anton Hain, 1975)). Heidegger admits that the origin and order of the Aristotelian *aitiai* are obscure, but maintains none the less that they indicate that 'to being belongs ground' (*GA* 26, p. 138). Isn't this rather massive utterance an imposition on the pluralism of Aristotle's analyses?

20 The principle of identity, similarly heard in a new way, also reveals its ontological import:

Properly, it sounds: A is A. What do we hear? In this ‘is’ the principle says how each and every being is, namely: itself the same as itself. The principle of identity speaks of the being of beings. The principle holds as a law of thinking only in so far as it is a law of being.

33 Greisch notes the total absence of the *es gibt* in 'Réduction et donation', *Révue de métaphysique et morale*, 1991; Villela-Petit contests Marion's Dasein-centred reading of the *Letter on Humanism* (*HQD*, pp. 89–90, vs Marion, *HQD*, pp. 65–6).

34 Greisch, 'Réduction et donation', pp. 297, 283, 296, 295.

35 For Robert S. Gall (*Beyond Theism and Atheism: Heidegger's Significance for Religious Thinking* (The Hague: Nijhoff, 1987), pp. 29–30) Heidegger is so radically anti-theological as to make 'unaccountable' the recourse to him proposed in my book *Questioning Back: The Overcoming of Metaphysics in Christian Tradition* (Minneapolis: Winston, 1985). I was building on the 'analogy of proportion' proposed by Heidegger to his theological colleagues in the fifties, and which no doubt indicates a mellowing of his position from the texts of the thirties on which Gall relies.

36 Michael Zimmerman, *Heidegger's Confrontation with Modernity* (Bloomington: Indiana University Press, 1990), p. 183. Zimmerman's discussion of 'productionist metaphysics' – like so many discussions of onto-theology – fails to engage Heidegger's critique of the principle of reason and his awareness of the force of that principle.

Heidegger, hermeneutics and ontology

Reiner Wiehl

Heidegger's thinking concerns itself with the fundamental question of European metaphysics. What is strange and unusual about this thinking is above all its contention that European metaphysics has not yet 'authentically' asked in any way its own most fundamental and defining question. Insofar as it has not yet even expressly entertained it, Heidegger claims that European metaphysical thought has been without a conception of its own essence and remains without a conception of itself. The question, which until now has not been authentically thought, is the question concerning the Being of beings, the question of the meaning of Being posed in terms of the ontological difference between Being and beings. This provocative thesis is formulated by Heidegger in ever new approaches and variations and is constantly repeated. Through willful interpretations of the classic components of European metaphysics he attempts to confirm it. Accordingly, all the classical thinkers of European metaphysics, whether Plato or Descartes, Leibniz or Kant, Hegel or Husserl, failed to consider that basic question 'authentically'; they failed to think it fundamentally. Their obvious 'forgetfulness of Being' led them to philosophical answers that failed to address the authentic and original question of metaphysics. Moreover, within the limits of metaphysical thought this failure remained, with a certain inevitability, unintelligible.

Heidegger's interpretations of metaphysics, which have meanwhile become classic, do not intend simply to undergird his contention concerning the hidden and unthought essence of this metaphysics. Heidegger intended above all that these interpretations open up new ways of thinking Being that, while allowing this unthought to be thought, simultaneously allow it to be preserved in its status as 'that which could not have been thought before' (*Unvordenklichkeit*). This demand to bring the unthought, as opposed to the thought, into the circle of the thinkable, the evident paradox of making this unthought into the thinkable and

that which is thought and doing it in such a way that it simultaneously retains its not being thought (*Ungedachtsein*) is a strong challenge to philosophical thinking. One can say that this challenge directly or indirectly finds its present-day response in a highly stimulating hermeneutical activity directed at the classical texts of traditional metaphysics. But this answer to the provocation of Heidegger's thinking must remain inadequate as long as the individual interpretations, however intelligent and subtle, do not say where they stand with respect to the alleged unthought of previous metaphysics.

Heidegger himself clearly saw the dangers and the risk of failure in his own thinking of Being. It was not just modesty and discretion regarding method when he described this thinking as being-on-the-way and thereby set it in sharp opposition to a thinking that develops from an absolute starting point to a definitive goal. And it was not simply a renunciation of audacity or pure prudence when he spoke of a 'step back' when he could have spoken of a 'step forward'. It could very well be – he ponders the possibility in his philosophical discussion with Hegel – that this 'step back' may fail, given the frantic development of modern technology, the heir of the old metaphysics. And still another danger could bring the new thinking of Being to naught, namely the danger that lies hidden in our facility to mistake the thinking of Being for the traditional contents of metaphysics so that 'everything that gives itself along the way of this "step back" will only be used and processed as a result of representational thinking'. In either case, he feared that the 'step back' will have possibly been in vain.

But is this testimony to the dangers of failure that threaten the new thinking of Being perhaps only the expression of an extreme and unredeemable demand made upon thought? Did Heidegger himself perhaps sense that such a thinking, which wants to think the unthought as such, that which is forgotten in the entire tradition of metaphysics, may easily get lost in the limitless realm of that which is not binding (*das Unverbindliche*)? Is the marked refusal of every possible mediation (*Vermittlung*) between the thought and the unthought, the renunciation of the production of a conceptual relation between the one and the other, a sign of disdain for that hermeneutical enterprise in which the interpretation is more important than an authentic understanding of the subject matter (*Sache*)? Or does the preservation of the irreducible difference between thought and the unthought, between the manifest and the hidden, concern something else? What is at issue – a philosophical truth or, ultimately, a philosophical error?

Heidegger's testimony to the dangers that threaten the new thinking of Being refers to an aporia basic to this thinking. On the one hand, like every thinking that aims at insight into some questionable issue (*Sache*), this thinking must try to gain an appropriate distance from this

issue so that it can show itself in its proper light. Hence it is justly demanded of this new thinking of Being that a distance, appropriate to the sought-after essence of metaphysics, be gained as a condition of the possibility of being able to think this essence. The 'step back' must meet this condition by gaining the proper distance, which involves a step away from and possibly beyond metaphysics. But where does this step lead? Which way out does such a thinking intend to take? For on the other hand such a thinking of Being comes from the metaphysical tradition and it is, thanks to this origin, a metaphysical thinking that is grounded in the essence of metaphysics and it is to this essence that his thinking must correspond. Must not such a thinking lose the ground under its feet when it attempts to distance itself from its own essence for the sake of a supposedly 'objective' distance? Can the thinking of Being as a metaphysical thinking take the required step back at all if it is true that metaphysical being is the final and most primordial Being? Does this not demonstrate that Heidegger's attempt to think the unthought of traditional metaphysics is, even before the possibility of failure, from the very outset meaningless, even absurd?

Now it is no exaggeration to say that no one saw this aporia so clearly or brought it so unmistakably to general awareness than Heidegger himself. He interpreted this aporia as the fate of metaphysics in our time. The most characteristic traits of his new thinking of Being are connected directly with this interpretation. Hence his refusal to characterize his own thinking as a metaphysical thinking; hence, also his peculiar formulation of coming to grips with (*Verwindung*) metaphysics, which mitigates (*ablösen*) the talk of 'overcoming' (*Überwindung*) and 'destruction' (*Destruktion*). In particular the 'hermeneutical ambiguity' that attaches to all of his interpretations of traditional metaphysics corresponds to this aporia and its interpretation of the history of Being. All of these interpretations say basically one and the same thing: that in all that metaphysics has hitherto thought there is an unthought that is not to be mistaken for the thought and that does not allow dialectical mediation. Thus, this contradiction between the thought and unthought, the manifest and the hidden, shows up in all forms of traditional metaphysics. Hermeneutical ambiguity defines the human way of relating in terms of a relation to Being and the world. But this ambiguity just as much defines the relation of thinking to metaphysics. Heidegger sees an essential belonging-together between both ambiguities, for the essence (*Wesen*) of man and the essence of thinking Being belong together for him. Both ambiguities are sedimented in human language, for language expresses itself both in our relation to Being and world and in thinking the Being of beings. Heidegger attempted in the language of his thinking to correspond to both these hermeneutical ambiguities and to the aporia described and its own interpretation of the history of Being. Hence his

language of thinking seems to vacillate between a literal faithfulness to the language of metaphysics and another unfamiliar (*unvertraute*) language of the new thinking of Being. These languages, however, are inseparable. They are only apparently different languages. Both intend the same: they intend to intimate something in their very hiding of something. They intend to leave something unexpressed in their referring to it. In short, they intend to correspond to the essence of truth.

What these two inseparable ways of speaking intend simultaneously to intimate and hide is not ultimately the feared-for loss of meaning of the traditional language of metaphysics and the hoped-for gain in meaning from the language of this new thinking of Being. Both expressions of thinking intend much more to preserve the essence of human thought and thereby to make further thinking possible. The question concerning the possible success or failure of Heidegger's thinking of Being is accordingly inseparable from the other question: Are the characteristically winding and strange paths of this new thinking attempts to overcome the aporia of metaphysical thinking and thereby to arrive on the other side of metaphysics on the firm ground of an unquestionable valid knowledge? Or is this thinking with its constant being-on-the-way and its concomitant unending attempts at new approaches satisfied if it illuminates this aporia, addressed simply as the fate of metaphysics in our present age, without any demand to resolve this aporia, but, instead, rejecting every attempt to explicitly develop the conditions of its possible transcendence (*Aufhebung*)? Is Heidegger's apparently extremely demanding thinking in the final analysis in a specific sense undemanding? Heidegger makes it intentionally difficult for his readers to decide one way or another. He plays with both possibilities of either making or renouncing this demand, perhaps for the sake of the authentic hermeneutical ambiguity, which must leave undecided whether the thinking of Being today has stepped out of the ambit of traditional metaphysics, or whether it even can.

And yet even with the value that this intentionally ambiguous thinking and speaking places upon consistency, one question cannot be dismissed out of hand: Hasn't Heidegger taken too seriously this aporia of metaphysical thinking that we have described? Hasn't he blocked off without reason all paths to its resolution through his arbitrary interpretation of the history of Being? What really compels us to comprehend this aporia as the inescapable fate of metaphysics in our day? Why not see it instead as a possible occasion and contingent point of departure for metaphysical knowledge in our age?

It is not by accident that this aporia reminds us of the old argument of indolent reason, according to which learning is absurd because without a presupposed knowledge it is impossible but with such knowledge it is superfluous. There appears to be a real kinship between this and the old sophistic game of unmediated opposites. For while we have, in the case

of these sophistries the unmediated opposites of being and nothing being played upon in order to produce the appearance of the impossibility of becoming and movement, we have in the case of Heidegger a conceptual game concerned with the absolute difference between essence and ground (*Grund*), a difference that threatens concept and knowledge with absence of sufficient reason (*Grundlosigkeit*) and unfathomableness (*Abgründigkeit*). Must one not ask in the face of this kinship and in light of the lack of mediations (*Vermittlungen*) whether Heidegger hasn't simply revived the ancient sophisms and lent them a profundity through his admittedly epochal interpretation of the history of Being that, for all that, is not beyond question? Or is this kinship and proximity something superficial, only a deceptive illusion that obscures the real meaning of Heidegger's thinking of Being?

Already ancient philosophy, particularly Plato's, noticed this strange proximity between the then modern sophistry and the ancestral speculative mythology, and it saw in this neighborly mingling a danger to well-grounded knowledge and clear human insight. Against this danger Plato developed the idea of a philosophical knowledge and the concept of a clear, well-grounded knowledge. He grounded this idea on both experience and thought and linked up this concept of cognition with the modes of thought, that is, the thought of experience and the thought of beings. And finally he elaborated this mode of thought into the first attempt at a philosophical, fundamental science, the science of dialectic. The thinking of experience, the recollecting of the perceived and the supposedly known, created, when methodically pursued, a counterweight against the nonbinding and seductive thought games played with sophisticated and mythologizing paradoxes. Moreover, the thought of beings as beings served not only as an instrument to disentangle the confused and to illuminate the dark and obscure, but it made it possible to lay the foundations of a philosophical science concerned with first principles and causes. Ever since Plato's initial founding of a philosophical science of first principles, all metaphysics has been based on these two fundamental supports; on experience and on thought. These two, however, are bound together by common principles.

2

Heidegger's new thinking of Being, however, has contrasted these two fundamental instances of secured and well-grounded knowledge to his own; the thought of experience with the experience of thought and the thought of beings with the remembrance of Being. But what does such a contrast mean? What insight can thereby be gained? Do these contrasts point to the possibility of a new speculative mythology, in the manner

of pre-Socratic thought, through which the tradition of metaphysics as a science of first principles will be overcome? Or is this characterization of the new thinking of Being as speculative mythology one-sidedly influenced through the critical perspective of Plato? Is this opposition and contrast in any way sufficiently determined to answer questions of this sort?

One is tempted to see in the philosophical hermeneutics founded by H.-G. Gadamer a counterproposal to the Heideggerian thinking of Being, and in his relationship to the latter to see something like a repetition of the old philosophical history of the Platonic critique of speculative mythology and its sophistic application. But the history of philosophy knows pure repetition, in the strict sense of the word, just as little as actual history does. Instead we find both stronger and weaker analogies in the basic traits of different histories, as well as progression and even regression in problems and their solutions. In fact, Gadamer's hermeneutics is far removed from a renewal of traditional metaphysics and from a revival of its idea of a philosophical science of first principles. To be sure, this hermeneutics has contributed to the defusing and neutralization of the ontohistorical aporia of Heidegger's thinking. Gadamer himself wants to see in his historical hermeneutics no unbridgable opposition to Heidegger's thinking of Being. Rather, he sees the essential difference to be in the posing of questions and problems. But this difference points unintentionally in the direction of an opposing position.

A sign of this can be seen in the loss of significance that the fundamental aporia of the metaphysical thought of Being suffers in historical hermeneutics. For a loss of significance always inevitably occurs when a single and absolute essence (*Wesen*) splinters into a multiplicity, thereby losing the original unity of its essence. Gadamer's hermeneutics has, in fact, replaced the one and single history of the thinking of Being with a multiplicity of histories of interpretations and so has apparently relativized the meaning of the one absolute history of Being. For the manifold histories of understanding Being and self-understanding do not initially present a unity subsisting in and for itself. Rather in each of these different, individual histories a distinct historical context of effects (*Wirkungszusammenhang*) constitutes itself from one or more other histories. In such a context of effects, the different histories that belong to it form a historical relation of ideal simultaneity, regardless of their lack of real simultaneity. A definite, particular history, regardless of what kind, allows its determinate character as such to be known in the mirror of other histories that project a spectrum of this character. A history that allows the character of another history to be known acts as its 'effective-history' (*Wirkungsgeschichte*). The temporal relation of an 'effective-history' is a dual relation involving being past (*Nachzeitigkeit*) and being simultaneous (*Gleichzeitigkeit*) with respect to all histories over against

which it functions as an effective-history. Accordingly, there belongs an effective historical reflection to each history, with respect to the determination of its character. Hence the character of a history can present itself with many shadings in accordance with the number of effective-histories that belong to the history in question.

The absolute ontological history of thinking (*Seinsgeschichte des Denkens*) is, from the standpoint of historical hermeneutics, only a particular history, even if a meaningful history. Thus what is binding in principle for each history binds it as well. The possibility of knowing its character is dependent on effective-historical reflection. This character can display itself in innumerable shadings in one of many other histories. Given this in-principle infinite multiplication of the one absolute ontological history of thinking, (*Seinsgeschichte des Denkens*) the absolute and irreducible difference between the determination of essence and the ground of essence loses that eminent significance which that history possessed as its constitutive aporia. In the splintering and multiplication of the one absolute history of Being, that one major aporia splinters and multiplies itself into innumerable lesser aporias. These in no way lose their meaning only because of their indeterminate number. Their relation to *understanding* differentiates itself from the relation of that fundamental aporia to *thinking*. This thinking intends to preserve the absolute difference between essence and ground for its own sake and for the sake of Being. It leaves this difference, and with it the aporia, as it is, and it always only gives it new expression.

In contrast, understanding looks always for agreement in communication. In the attempt to come to an understanding, historical hermeneutics asks a question for which an answer is sought. Such an approach implies that an answer can be found even if it is not completely convincing, even if it leaves behind something not understood or even, perhaps, if something not understood is engendered. The relation between a history and its effective-history presents itself in respect to this immanent aporia as a relation of question and answer. In its context of effects with other histories effective-history forms a structural whole of question and answer. The difference between Gadamer's historical hermeneutics and Heidegger's thinking of the history of Being is not just a difference in the estimation of the history of Being in comparison to other histories, nor is it simply a difference in the weight given to the two fundamental concepts of understanding and thinking within the whole structure of the human comportment toward Being. These differences in estimation refer rather to specific differences in the determination of basic, historical relations of the relation between absolute and relative Being, between the unity and multiplicity of beings, and further, between question and answer, Being and self, and between truth and mediation.

Initially, specific differences of this kind find a unified expression in a

different position with regard to the problem of ontology. Gadamer consciously gives his hermeneutical philosophy an ontological foundation in order to mark itself off from a methodological hermeneutics, that is, from a technique or method. In contrast, the idea of an ontological grounding of Heidegger's thinking of Being runs counter to the meaning of this thinking, to its self-characterization as being-on-the-way, as well as in the consistency with which it maintains its irresolvable hermeneutical ambiguity. For this ambiguity claims that in this epochal thinking of Being it cannot be definitely decided whether thinking still moves within the essential realm of traditional European metaphysics or whether it has already reached the ground of this essence and thereby has pushed beyond the sphere of its validity and influence. And it cannot be definitely decided whether that which has been thought in the metaphysical tradition is being thought about further in another form and way of speaking or whether Heidegger is not already in the realm of the unthought when he attempts to think in these new forms of expression and ways of speech. In the face of such an indecisiveness and undecidability, the talk of a new ontology as opposed to the old is, at least provisionally, meaningless.

In contrast to this, what is the meaning of the ontological self-grounding of hermeneutics? What we find first of all, instead of hermeneutical ambiguity (*Zweideutigkeit*) in relation to the thinking of Being in traditional metaphysics is a certain manifold of ambiguities (*Vieldeutigkeit*)¹ which determines Gadamer's relation to traditional metaphysics and distinguishes it from Heidegger's ambiguity, even when this 'many-sided' ambiguity is often superimposed on Heidegger's ambiguity. This many-sided ambiguity marks certain strengths and weaknesses of ontological hermeneutics, particularly in comparison to the strengths and weaknesses of Heidegger's thinking of Being. Hermeneutical ontology defines itself as a universal ontology of experience and language. With this self-grounding, hermeneutics certainly neither intends a new ontology in the place of the traditional one, nor does it intend simply to take over traditional ontology just as it is and to undergird itself with this foundation. Gadamer's hermeneutical ontology of experience and language cannot be forced into a dichotomous framework that separates old and new. In this 'neither-nor' it is analogous to the hermeneutical ambiguity of Heidegger's thinking of Being.

But the many ambiguous ways it relates to traditional ontology and metaphysics points in yet another direction. It remains undetermined whether the ontological region of experience and language is primary with respect to the region of traditional ontology only according to time or also according to Being and knowledge. In its ontological foundations philosophical hermeneutics leaves a question unanswered that presented a key problem for traditional metaphysics to which it sought an answer

in the form of a methodologically basic principle, namely, the principle of the difference between that which is 'for us' and that which is 'in and for itself' the first and most original principle. The old metaphysics was well aware that a region of Being preceded it, a sphere of experience, of everyday language and pragmatic behavior from which it took its own point of departure. But it recognized the priority of this region only in a limited sense, namely in the sense of a certain temporal priority. While in its own sphere – the sphere of true and authentic knowledge of first principles – it claimed absolute priority. This absolute priority is a priority in a three-fold sense, namely a priority in respect to *Being* and to *time* as well as to *knowledge*. Now certainly the historical hermeneutics of our day is in no way a stranger to the classical principle of methodological mediation, of the systematic ordering of beings according to basic priorities. On the contrary, this hermeneutics makes a specific hermeneutical use of this principle in its effective-historical ontology and its logic of question and answer. In this respect, a given effective-history consequently has, in a certain sense, priority for us *vis-à-vis* its preceding history and in another sense it does not. Similarly, with regard to the relation of question and answer, there are priorities in more than one sense and in more than one respect. In this sense it follows that a given effective-history is prior to its prehistory (*Vorgeschichte*) with respect to *knowledge*, but not in a temporal sense. And it is this priority of a knowledge 'for us', considered as effective-historical, that allows us to see the point of departure of a question in this effective-history, which seeks its answer in the historical context in which it has its ontological and logical locus. At the same time, it appears that the hermeneutical use of this classical principle of mediation is not limited to its application in the sphere of effective-historical ontology and the logic of question and answer. On the contrary, it seems that this principle is being applied beyond these realms to the relation of hermeneutics as a whole to traditional metaphysics. For the hermeneutical ontology of experience and language advances the claim to be both more original and more comprehensive than traditional metaphysics. It claims absolute priority over traditional metaphysics.

From the standpoint of such absolute priority, traditional metaphysics necessarily appears as derivative and secondary. Paradoxically, it takes on the appearance of a particular ontology insofar as hermeneutics presents itself as a general, that is, universal, ontology. The strength of Gadamer's hermeneutical philosophy over against Heidegger's thinking of Being lies in this definition of its own fundamental relationship to traditional metaphysics. While Heidegger's thinking of Being takes a path that remains continually on-the-way to and beyond the ground of thinking, hermeneutical philosophy gives itself from the start such a primordial and comprehensive foundation that it must appear

meaningless to want to think beyond it toward something still more primordial. It is this apparently absolute primordially and breadth that lends hermeneutics its specific distance from metaphysics and thereby makes possible the conditions of a possible critique of metaphysical thought. In this manner, hermeneutics places itself within the traditional ambit of contemporary philosophical critiques of metaphysics.

Moreover, the breadth of its foundation also opens up worlds of experience and linguistic expression that demand a new right and significance of their own over the predominance of metaphysical thinking. These are worlds of nonmetaphysical experience and language within a general culture shared with metaphysics, as well as the nonmetaphysical worlds of experience and language of other cultures. In this respect, Gadamer's hermeneutics is related to Cassirer's *Philosophy of Symbolic Forms*. In a similar fashion, hermeneutics seeks insight into the comprehensive foundations of cross-cultural research; in a similar fashion, hermeneutics is a philosophy of culture and a general cultural anthropology. On the other hand, hermeneutics shares with Heidegger's thinking of Being the attempt to come to grips (*verwinden*) with metaphysics. In this, hermeneutics shows itself to be, in a certain respect, more successful in gaining a theoretical distance to metaphysics than Heidegger's unfathomable (*abgründigen*) thinking of Being.

But how are we to interpret the intellectual proximity of hermeneutical philosophy to such opposing positions as those of Cassirer and Heidegger? Does the former succeed in bridging these extremes? Is hermeneutical philosophy in any way suited to such a task? What differentiates how hermeneutics comes to grips with metaphysics from a transcendental-philosophical critique of metaphysics in the style of late Neo-Kantianism? The strength of philosophical hermeneutics is, as it is with any philosophical theory, simultaneously somehow its weakness. Thus the laying of the philosophical foundation of a hermeneutical praxis in a universal ontology of experience and language certainly could not be thought out more comprehensively. At any event, it has extended and enriched the region of prelinguistic worlds of expression through presenting it as a special kind of language world.

But this extraordinary *breadth* of the hermeneutical grounding has been paid for with a loss of *depth*. At least this picture forces itself upon us when one compares this self-grounding with the unfathomableness (*Abgründigkeit*) of Heidegger's thinking of Being, which places the whole essence of a ground (*Grund*) in question. If Heidegger wins depth at the cost of breadth, Gadamer reverses this relationship. And in both cases signs of the trivial begin to show themselves, as it always does where philosophical thought can do one only at the cost of the other. Thus even hermeneutics has its characteristic triviality which lies precisely in its ontological self-grounding. Its actual weakness, however, lies in its

failure to clearly distinguish between philosophical theory and a theoretical principle, between ontology and an ontological principle. An ontological principle no more makes an ontology than a logical principle makes a logic. This pertains to both the ontological principle of effective-history and to the logical principle of the correspondence of question and answer. Both principles are not by themselves sufficient to 'ground' an ontology and an ontological logic.

3

An ontology is an interrelated whole, a system of ontological principles formulated with respect to a definite manifold of beings, which is, in turn, determined by these principles. This interrelation demands a manifold of logical principles for its systematic presentation. This systematic unity of these principles belongs to that ontology and they present us with a constitutive logic for the same. An ontological logic belongs to every ontology and makes up the form of its presentation, a form that is intrinsic to it as its inner form. An ontology is universal with respect to the universality of its principles and with respect to the universality of the manifold of beings for which the same principles are valid as universal principles. Hermeneutical philosophy's neglect of the difference between an ontology and an ontological principle makes its ontological foundation ambiguous in many ways (*Vieldeutigkeit*). The hermeneutical ontology of experience and language is ambiguous both in terms of its concept and in terms of its function. This ambiguity allows a series of different interpretations. According to one such interpretation, hermeneutical philosophy is not an ontology at all in the strict and proper sense of the word. Rather, it specifies several general conditions that form the outer limits for a possible universal ontology that, before all else, requires future elaboration in conjunction with the development of a hermeneutical, ontological logic. Accordingly, both the principle of effective-history would have to be developed into a universal ontology of histories and historical relations, and the logical principle of question and answer would have to be elaborated as a universal theory of forms and structures. In this way, the universal ontology of histories and the logic of forms and structures would form an interconnected theoretical whole. Then the infinite multiplicity of human experiences and linguistic forms of expression would allow themselves to be thought as embedded in determinate historical relations and as formed and structured in respect to determinate structural relations.

A second possible way of interpreting a hermeneutical ontology is based on the supposition that certainly in theory one must differentiate between an ontology and one or more ontological principles or, more

exactly, between an ontology and an indeterminate multiplicity of ontological principles, but that in each concrete case no such difference can be made without qualification and with sufficient clarity. On this supposition rests the distinction between 'strong' and 'weak' ontologies. An ontology is strong inasmuch as it can make this difference clearly visible and it is all the more strong the better it succeeds in doing so. Thus we can take as a model of such a strong ontology those which satisfy the following conditions: an undetermined multiplicity of principles is developed into a unified ontological framework within which each individual principle, as an ontological principle, is, with respect to every other principle, univocally determined according to its concept, position, and function. At the same time, this ontological framework makes it possible to recognize the completeness of all the principles, as well as their general and special validity for a certain region of being. And finally, it holds for this model of a 'strong' ontology, that it can bring any other principle that has no well-defined logical place within it into a well-defined logical relation with those principles that belong to it, be it into a relation of a specific compatibility or of specific incompatibility.

In contrast, 'weak' ontologies are those that do not satisfy the general conditions of a strong ontology. And they are all the weaker the further they remain from the model of a strong ontology, and the less they are in a position to develop an indeterminate manifold beyond a mere 'rhapsody' of general principles into a well-defined ontological framework. Even if the difference between a strong and a weak ontology has been sketched only provisionally and, in reality, remains a relative difference, still this definition suffices to enable us to characterize hermeneutical philosophy with regard to its self-grounding as a very weak ontology.

This characterization holds by no means only in comparison to the paradigmatic strong ontologies of traditional metaphysics, such as, for example, Hegel's ontology, which has always been recognized, even by Heidegger and Gadamer, as a paradigm of a very strong ontology. Hermeneutics is also a weak ontology compared to itself insofar as it is considered not only as an actual ontology but also a possible ontology for which it provides a general context of meaning. Both these ontological interpretations of hermeneutical philosophy have primarily a theoretical character. According to each, the infinitely many-sided, in each case concrete hermeneutical practice of communication and interpretation retains a theoretical basis, be it in the form of the conditions of a possible strong ontology, be it in the form of an actual, even if weak ontological foundation. Here the individual ontological principles function as theoretical elements whose validity extends to the infinite multiplicity of the possibility of human experience and expression as the matter and content of hermeneutical practice.

Besides such a primarily theoretical interpretation of the foundations

of hermeneutical philosophy a pragmatic-ontological interpretation is also possible. In this case the ontological principles do not function as theoretical building blocks of a possible or actual ontological foundation but as pragmatically valid principles of an ontological interpretation. A pragmatically valid principle, such as effective-history, is not to be confused with a methodical rule of procedure for understanding or interpretation. Rather, it presents, so to speak, a metahermeneutical principle, which is in one way or another applicable to interpretative contexts, which are more or less regulated in various ways. Despite their differences, all three ontological interpretations of hermeneutical philosophy agree in their claim that the presupposed ontological principles are valid for the comprehensive contents of human experience and expression and that they function for these contents as formal principles of the most general sort.

From such an ontological interpretation of the self-grounding of hermeneutics, we may now distinguish an interpretation which, from the point of view of its actual content, may be called the ontological self-interpretation of hermeneutics. Here we must seek the universal ontological foundation of concrete hermeneutical practice in the complete range of the possibilities of experience and expression. And correspondingly we find here that within this given complete framework the individual experiential and expressive elements function as ontological principles in regard to the comprehensive multiplicity of possible interpretative contexts.

Analogous to the three formal-ontological interpretations of hermeneutical philosophy presented above we can think of three interpretations that are content-oriented. The first provides only the general boundaries for the conditions of a possible ontology of experience which is to be formulated with respect to the multiplicity of experiential and expressive possibilities. The second implies what can be called a 'weak' ontology of experience. This weakness can be defined analogously to the aforementioned weakness, namely as inadequately differentiating between the context of the experience and an individual experience. In the third, we have finally the pragmatic-ontological interpretation according to which the individual principles of experience function as principles of a pragmatic-ontological interpretation of all possible contexts of interpretation.

By means of this fundamental difference between form and content within the ontological self-interpretation of hermeneutical philosophy, we can discern a further fundamental ambiguity. It remains an open issue whether the hermeneutical-ontological principles have the character of general thoughts and basic concepts or whether they pertain to general experiences and modes of expression or whether we have to do with mixtures of one with the other. Accordingly, hermeneutical philosophy leaves the fundamental ontological relation between thinking and

experience undetermined. Thereby possibilities of distinguishing between the thinking of experience and the experience of thinking are left open. As we have already said, an ontological logic belongs implicitly or explicitly to a philosophical ontology, and its principles serve the systematic development of ontological principles in their mutual conceptual and functional determination. In this, we must take into account throughout that the principles of this logic may be distinguished from the corresponding ontological principles only in regard to their function, not, however, in regard to their conceptual determination and logical space. To this extent, the difference between an ontology and an ontological logic has a purely functional character. But however one distinguishes between an ontology and its ontological logic, the ambiguity of one brings in its wake a corresponding ambiguity in the other. Thus analogous to the three, or, as the case may be, six ontological interpretations of hermeneutics, we can think of a corresponding plurality of interpretations of that hermeneutical-ontological logic that belong to hermeneutics. According to the first, such a logic serves only to provide the general framework of the conditions for a possible ontological logic; according to the second, we have to do with a weak logic, the weaknesses of which corresponds to that of the ontology to which it belongs; according to the third, we deal finally with a pragmatic-hermeneutical logic. Over against the pure theoretical differences between thoughts and experiences, between conceptual and linguistic realities, the logical principles of hermeneutics behave like the ontological principles, ambivalently.

This is not the least of reasons why the relation between ontology and ontological logic remains open and relatively inexact in hermeneutical philosophy. The hermeneutical ambiguity of the principles affects especially the ontological and logical function of essences, justifications, and definitions. Contemporary hermeneutics gives at least the appearance of assigning absolute priority to understanding and interpretation over thought and knowledge. Such a move has conditionally disabled the essentially different priorities of traditional metaphysics and its epistemology; perhaps even turned them upside down into their opposites. Along with this change of epistemological priorities, a change in attitude took place simultaneously with regard to the traditional validity claims of the principles of 'essence', 'justification', and 'definition'. Thought, for traditional metaphysics, was directed toward the determinate goal of knowledge of essences, of adequate justification and conclusive definitions. In contrast, understanding and interpretation cannot be said without qualification to be built on a universally binding and definitive ideal of knowledge. Of course, every attempt at understanding and communication has its provisional, immanent goal that regulates it in this instance. And such an attempt must satisfy certain criteria and conditions if it is finally to be recognized as a successful, as a sufficient, and as an ulti-

mately true understanding. Nevertheless in such a process of understanding it always remains at first an open issue to what extent these criteria and conditions are valid only in this and not other processes, and to what extent they can claim beyond this a general or even an absolutely general binding validity. In any case, these criteria and conditions do not without qualification simply correspond to those of an essential, basic, and definitive knowledge of truth. Rather, it appears that much understanding can reach its goal even without any insight into essence or without adequate self-justification. But this does not mean that the principles of true knowledge can be fundamentally divorced from the processes of understanding and interpretation.

If philosophical hermeneutics grants an absolute priority to understanding and interpretation over thinking and knowledge, then it seems that it is in a position to claim that an unmistakable freedom has accrued to the first-mentioned epistemological procedures in their relation to the principles of thinking and knowledge, that is, to essences, justifications, and definitions. Thus it can be that these principles never come directly into view in the attempt to understand. But it can also be the case that this attempt to understand directs itself specifically and consciously toward a pre-given essence, toward a given justification or definition, as its determinate object and content. On the other hand, a specific understanding can present itself in the form of an essential insight, a specific justification or definition. And neither can we rule out the possibility that understanding, regardless of the difference between form and content, will orient itself at least indirectly by those principles, at least unconsciously and in an unfathomable (*abgründige*) manner.

But is understanding's relative independence of the principles of thought and knowledge sufficient to justify the priority of understanding over thought and knowledge? Have we thereby found sufficient means to differentiate one of these epistemological attitudes (*Verhalten*) from the other? The position of hermeneutical philosophy with respect to the principles of 'essence', 'justification', and 'definition' is, as it is with respect to any principles, fraught with a many sided ambiguity. Thus it remains entirely open whether or not and to what extent these principles play a specific role in the event of understanding and interpretation. Moreover, this ambiguity, which in general characterizes the hermeneutical use of principles, does not disappear even if we presuppose that philosophical hermeneutics allows these principles at least a certain limited meaning in the processes of understanding. Also in the case of the principles of 'essence', 'justification', and 'definition', one can clearly distinguish conceptually what neither hermeneutical praxis nor its ontological self-justification sufficiently distinguishes, namely the general conditions of the possible validity of principles, so-called weak principles, and the pragmatic use of principles.

What is 'weak' in such principles is not to be confused with the mere insufficiency of their conceptual and functional determination. 'Weak' also implies even here a particular form of indeterminacy and ignorance. We must differentiate a weak essence from a definition of an essence that is obviously insufficient, just as we must distinguish a weak reason from an insufficient justification, and a weak definition from an inadequate definition. A weak essence is, furthermore, not to be confused with a concept of essence, such as we find in nominalism, where essence is seen as a subjective-linguistic posit (*Setzung*) without objectively real content. Rather in this context we take a weak essence to be an essential unity of coherent phenomena and essential determinations of a subject matter (*Sache*), which, despite the obvious unity of this evidence, does not allow itself to be known on this basis, whether because, as an essential unity of this questionable subject matter, it does not have sufficient state of stable determination (*hinreichenden Bestand*) or whether because it points beyond its unity to a primordial unity of determinations, even if this turns out to be a hidden essential ground of the matter at issue. Analogous determinations of weakness, as opposed to mere inadequacy, obtain for justification and definitions.

Weak principles, as we have denoted them here, can also be characterized as aporetic principles. This aporetic character determines the indeterminate and unknowable nature of weak principles. Inasmuch as the hermeneutical use of these principles leaves open to what extent they do or do not fulfill their function, it also leaves undecided the direction in which thinking led by these principles takes understanding. We cannot decide whether it is in a direction of growing insight into essence or in increasing distance from such; whether it is in the direction of an always adequate justification or in the opposite direction; whether it is in the direction of a conclusive definition or back to a conceptual tentativeness.

4

This presentation of the many-sided ontological-logical ambiguity of hermeneutical philosophy in its use of principles is not an end in itself. More than anything else it should help us gain a critical perspective on the problems of Heidegger's thinking of Being, his intentional obscurities, and his hermeneutical ambiguities. Before all else, the consideration of the hermeneutical ambiguity (*Zweideutigkeit*) of this thinking of Being, mirrored in the manifold of ontological ambiguities (*Vieldeutigkeit*) of Gadamerian hermeneutics, should make clear how the strenuous attempt of that thinking to think the unthought in traditional metaphysics unavoidably calls forth of itself its own thought. As we have said, Heidegger's hermeneutical ambiguity has its own strengths and weaknesses as

does Gadamer's manifold of ontological ambiguities. A comparison of both promotes, at first, that which is common or at least the appearance of a fundamental commonality. This is the thought of the absolute priority of Being, of Being over thinking and knowledge, over consciousness and human existence. In light of this absolute priority of Being one is tempted to speak of the highest ontological principle of hermeneutics and the thinking of Being under which all other ontological and logical principles, from whatever source, are subsumed. This highest ontological principle presents itself under many names and in many forms, sometimes under its own name, sometimes as the principle of finitude and limitation, sometimes as the principle of substantiality and existence. However these principles are related to the highest principle, however they represent it, in any case certain priorities are posited. Priority is given to finitude over infinitude, to the conditioned over the absolute, to thing-like substantiality over self-conscious subjectivity, to the concrete, individual existence over the abstract and general essence.

It was not without reason that Gadamer stressed the internal consistency and unity of this thought with the much discussed '*Kehre*' in Heidegger's thinking of Being, which occurred after *Sein und Zeit*. He maintained that it was not first after the '*Kehre*' but already in his magnum opus that Heidegger placed the absolute priority on the question of Being before all other questions of metaphysical thought. In this interpretation, Gadamer shows where despite the difference in their questions, he sees the essential common element of his hermeneutical thought with Heidegger's thinking of Being, that is, in the recognition of the absolute priority of Being as the highest ontological principle. From such a vantage point the '*Kehre*' seems to be the essential common concern of their thought. The '*Kehre*' is first of all and primarily a turn in opposition to that turn of thought that Kant termed 'Copernican' and took as a general characteristic of his newly founded critical transcendental philosophy. Kant's 'revolution' was also in a certain sense a turn, namely a reversal of the traditional priority of Being over knowledge in favor of the opposite absolute priority of thought, of the knowledge of objects, of the conscious knowing subject over Being. In light of Kant's Copernican revolution, the turn of both hermeneutical thinking and the thinking of Being appears as a 'return' to the original thought of Being before that turn, as a 'step back'.

But doesn't this commonality of a turn (*Kehre*) of thinking, of a step back in hermeneutical thinking and in thinking of Being, hide an essential difference? What is to say that this step back takes a different direction in each case; in one case back to the dialectical ontology of Plato and in the other case still farther back to the beginnings of Greek ontological thought in the Presocratics? Isn't this different direction of the 'step back', that is, the different region that is reached by each 'step back',

an indication perhaps of the significance of the difference between the many-sided ontological ambiguity of hermeneutics and the hermeneutical ambiguity of the thinking of Being?

This question is directly related to another: Have we adequately understood the meaning of this 'turn' (*Kehre*) of thought, of this 'step back' in general? Is not the interpretation addressed above at the very least misleading? Is not the observed proximity addressed above at the very least misleading? Is not the observed proximity of Gadamer's hermeneutics to the philosophy and cultural anthropology of late neo-Kantianism not the only thing that speaks against this interpretation? Does not Heidegger's high regard for Kant's thesis that 'being is not a predicate', a thesis that he brought into express proximity to his own thought, just as much argue against this interpretation? In fact, both Heidegger and Gadamer have essentially promoted this misleading interpretation. And it is just this interpretation that has produced the no less misleading impression of a kinship with other very influential tendencies of thought in our time. Hence, in Marxism, economic 'Being' is given priority over the political and cultural 'Being' of human beings. Thereby an absolute priority of Being over thought, of objectivity over subjectivity is claimed. In a similar manner, psychoanalysis – as metapsychology and therapeutic practice – makes use of this absolute principle of Being in that conscious knowledge gives place to the conditioned priority of the unconscious being of the modern psyche. Existentialism and structuralism also belong among those theories that give precedence to Being absolutely and to absolute Being over knowledge: the first in the form of the priority of concrete existence over abstract essence; the second in the form of the priority of structural over subjective Being. It is this elementary use of the absolute foundational principle of Being that gives the appearance of a real commonality between these highly divergent and different theoretical frames and thus has enabled their incidental syntheses. But is the use of this fundamental ontological principle in such an elementary way really meaningful? Is the use of this principle in any way sufficiently defined in order to speak of a theoretical foundation thanks to its employment? It seems that the employment of such a principle draws its alleged meaning from the completely meaningful task of correcting the widespread self-overvaluation of human consciousness and thereby of counteracting the genesis of a false consciousness of the theoretical and practical capabilities of human beings. But is this fundamental principle useful at all for such a task? Are not maxims of reason much more effective in promoting theoretical and practical insight in the life practices of human beings than an abstract conceptual formula? In fact, this absolute principle of Being finds its application as a critical court of appeal over philosophical theories that overestimate human consciousness, which appear to aid and abet the human spirit, such as, in particular, the

philosophical theories of transcendental and speculative idealism. But is this critical use against traditional theories any better justified? Is it any more effective in its critical intent? Is it true at all that philosophical idealism necessarily fosters the overestimation of the human spirit against the power of nature? Or does this interpretation hold only for a certain reductive reading of idealism? Does not idealism after all make something clear to humans other than their own essential determination?

This positing of a highest and absolute foundational principle is in no way sufficient to render powerless an ontology as whole and this even to a lesser extent if, as in the case of idealism, this principle is integrated into its opposed position in a determinate way. For in this idealism, the priority of Being over thought is not a meaningless idea. Rather, it is conceived in connection with the opposed priority and this in a carefully differentiated and methodically harmonized manner. The theoretical foundational relation of nature and spirit rests here on a general ontological foundation whose individual ontological priorities are ordered according to the priorities of Being, of time, and of knowledge – for us and in and for themselves.

There are many deficiencies observable in the use of this ontological foundational principle in the postidealistic and antiidealistic movements of the recent and most recent past. Such a deficiency lies already in the isolating and absolutizing of a single foundational principle. For the positing of the absolute priority of Being yields in general no ontological principle, but instead only a quite general concept of such a principle, without any content and without any guidance in how to obtain such a content. Instead, the unmethodical use of this absolute principle of Being fosters the resuscitation of those old metaphysical errors that Kant set out to definitively defeat in his critique of reason and its 'Copernican revolution'. These are the old metaphysical errors of confusing principles and categories that now present themselves again in different forms and contents. Such confusions are, as always, the confusion between form and content, of possibility and actuality, and ultimately all the confusions that are possible between the abstract and the concrete.

A further deficiency in the use of this absolute foundational principle arises from the consistency of its isolation. In its absolute autonomy, in its isolated use without those complementary principles, which give this use a determinate meaning in the first place, we see the general loss of the validity of this principle that we have denoted as the principle of mediation, that is, the systematic ordering of beings according to well-ordered priorities. In place of the methodically interconnected context of things, worked out according to well-differentiated priorities of Being, time, and knowledge – priorities on the one hand for us and on the other hand in and for themselves – we find, henceforth, individual contingent positings of this or that absolute priority. And this methodical

foundational principle of traditional ontology appears only in a reduced form, be it as the difference between the priorities time and knowledge or of Being and time. The widespread and widely recognized talk of the decline of the great systems of modern philosophy in the course of the nineteenth century signifies by no means only that the universal ontological foundation dissolves and that its corresponding conceptual vocabulary loses its general binding force, but it also signifies that philosophy suffers the loss of a universally recognized method. In place of this loss we find isolated and occasional use of this or that principle and as a consequence of these uses, ambiguities, and confusions about principles.

Heidegger's thinking of Being and Gadamer's philosophical hermeneutics have, more or less, consciously placed themselves squarely within this effective context of this recent and most recent history of metaphysics. To this extent, the hermeneutical ambiguity of Heidegger and the ontological ambiguities of Gadamer are reflections of this effective context. *Being and Time* is not only the title of Heidegger's magnum opus, it is also a key for understanding this effective context that emphasizes the loss of validity of that methodical foundational principle of traditional ontology: 'Being and time' and *not* 'Being and time and knowledge in relation to us and in and for itself'.

The hermeneutical ambiguity of Heidegger's thinking of Being corresponds to the paradoxical situation in which an ontological principle as a foundational principle is opposed to a degenerate (*verfallenden*) ontology. It is paradoxical because such degeneration requires no counterforce and because that which is valid cannot be disarmed through an isolated and contingent principle. But the many-sided ontological ambiguity of hermeneutics also corresponds in its own way to the effective-historical context in which it stands. It is not difficult to recognize in the manifold of ambiguities of the ontological self-grounding of this thought, the ambiguity of its use of ontological and logical principles in the above-named movements of the past and present century, which, like hermeneutics, rest on the foundational principles of Being.

But have we adequately understood Heidegger's hermeneutical ambiguity and Gadamer's ontological ambiguity in taking them as reflections of an effective history? What is the specific difference between these reflections?

Heidegger has attempted to think the hermeneutical ambiguity that he discovered as the destiny of metaphysics; not simply its most recent destiny, but rather its ancient destiny implicit from its inception. Yet hasn't he simply repeated in another form Nietzsche's thought that the destiny of European metaphysics, and with it the destiny of European culture, is nihilism? Is the hermeneutical ambiguity in the end only another expression for the completely primordial skepticism, for an unfathomable (*abgründig*) nihilism? Without a doubt, Heidegger had

other intentions. It was not by chance that he characterized Nietzsche as the last metaphysician. He did so to avoid having to characterize himself as the last. His thinking of Being aims to go beyond nihilism in that he conceives this to be the most conclusive form of metaphysics; namely, as the ultimate consequence of the attempt of thought to gain a sufficient ground. For this reason his thinking of Being seeks no sufficient grounding. Rather, it intends to think the essence of a sufficient ground in order to think beyond this essence. But does this thinking succeed in getting beyond the thinking of this unfathomable nothing (*abgründigen Nichts*)? Can it think beyond nihilism? Does it enable us to think our way around nihilism? Didn't Nietzsche himself run aground precisely on this problem? Hermeneutical ambiguity corresponds to fundamental, ontological, hermeneutical truth. This is more primordial than the truth of metaphysics, which in the end turns out to be only the result of a successful thought process, a successful act of knowing that brings to light nihilism. This hidden and late-emerging nihilism in the truth of metaphysics is not, however, the unthought-of metaphysics. Were it so, it could not appear as the ultimate consequence of metaphysics. Hermeneutical truth intends to open a place for the secret, for the unthought, for the ineffable on the other side of the effable nothing of nihilism. But is the unthought really thought in this thinking of truth, in the thoughtful preservation of its countertrait of 'disclosedness'?

Gadamer's historical hermeneutics has integrated this fundamental ontological and hermeneutical concept of truth into his own hermeneutical thought and displaced it into its own conceptual space of ontological and logical ambiguities. Truth, in Gadamer's hermeneutical philosophy, is as ambiguous as the ontology and the hermeneutical use of ontological and logical principles. Hermeneutical truth contains something of that idea of a critique that limits human knowledge to that which is humanly possible. But, on the other hand, we cannot fail to overhear an emphatic augmentation of our experience found in the completed fullness of inexhaustible being, which is experienced in the essence of the work of art. Lastly, we should not fail to recognize a sobering significance of a truth that appears in connection with the many ambiguities, in that it exhorts us to the idea of univocal and complete determination. All these descendants of the hermeneutical concept of truth have a great deal in common with the concept of truth in traditional metaphysics.

In comparison to all these many ambiguities, the strength of Heidegger's thinking of Being lies in 'the univocity of hermeneutical ambiguity'. But is this ambiguity really so 'univocal' as it appears? In fact, it only superficially conceals all those ontological ambiguities previously developed. Every one of their possible meanings can be considered in light of hermeneutical truth. A particular affinity appears to exist between 'weak' ontologies and weak principles on the one hand and hermeneutical

truth on the other. But in order to think the unthought-of metaphysics, Heidegger's thinking of Being attempts to avoid ontological thinking. He attempts to avoid the use of ontological and logical principles by thinking these principles in light of hermeneutical truth, that is, in terms of their own hermeneutical ambiguity. In this respect, thinking of Being is fundamentally different from hermeneutics, which, with all of its many-sided ambiguities, remains within the ontological, logical realm of principles and possible justification. In contrast, Heidegger attempts to avoid the many ontological and logical ambiguities of traditional metaphysics and its effective history in order to be able to think the unthought. In this manner he shows, whether intentionally or unintentionally, not the unthought-of metaphysics but rather the unthought of his own thinking of Being.

Note

1 Wiehl is obviously playing here on the difference between *zwei* (two) and *viel* (many). Both *Zweideutigkeit* and *Vieldeutigkeit* can be translated as 'ambiguity'. The latter, however, suggests in this context a more complex, many-sided ambiguity. – Trans.

Being as appropriation

Otto Pöggeler

Part one

Being and Time

Heidegger, in *Being and Time*, takes up Plato's question of what the expression 'being' (*seiend*) actually means. In fact, he sees himself forced, first of all, to reawaken an understanding of the question of the meaning of Being (SZ 1¹). This question must be understood if one is to inquire after the Being of beings and the modes in which Being becomes materialized in other than a naive and short-sighted manner. 'And precisely the ontological task of a nondeductive, constructive genealogy of the various possible modes of Being requires a preunderstanding of that which we actually mean by this expression: "Being"' (SZ 11). The question of Being (*die Seinsfrage*) is not the 'concern of a free-floating speculation on the most general generalities', but rather, is both the most fundamental question and the most concrete. If ontological research does not wish to remain suspended without a foundation, it must presuppose a clarification of this basic question (SZ 8ff.).

While the question of the meaning of Being still occupied a central position in the investigations of Plato and Aristotle, it was later forgotten. Being is held to be the most general and most empty concept and thus, an undefinable but yet self-evident concept. 'Thus, that which, as something hidden, drove the philosophizing of the ancients to, and kept in, restless activity thereby achieved a crystal-clear self-evidence, such that whoever now asks about it (i.e., *die Seinsfrage*) is charged with a methodological error' (SZ 2). How did this come about?

Metaphysics asks: what is Being? It inquires after the Being of beings. It orients itself toward the beings which it finds in the 'world' and can thus represent them. Metaphysical thinking is, from the very beginning, representational (*vorstellendes*) thinking. It therefore has the temporal

structure of a pure making-something-present. Beings, understood as that which actually is, are interpreted in terms of presence, 'i.e. they are conceived as presence ($\sigma\upsilon\sigma\tau\alpha$)' (SZ 26).

If the Being of beings is grasped as presence, it is understood with respect to a specific mode of time, the present (SZ 25). Metaphysics, however, does not further pursue the problem hidden in the fact that Being as presence is always already understood within the horizon of time. Metaphysics does not inquire after Being as such, but rather, forgets and disguises the whole question of Being. Even though Being, as presence, is, in a still hidden manner, thought in the light of time, ontology from its earliest beginnings seems to focus all its efforts on the attempt to keep the primordial characteristics of time out of consideration. Ontology supersedes time or levels it off to static time, i.e., eternity. The meaning of Being is then determined on the basis of this 'frozen' time, but in such a way that this meaning is never considered by itself. Thus, the Being-question as the question of the meaning of Being itself never really becomes a problem. When Heidegger inquires after Being and time, he raises the question of Being itself. The delineation of the meaning of Being is no longer to be merely presupposed, but must be thought through in itself. In contrast to this, when Being in metaphysics is understood as presence, the temporal moment remains simply in the present and thus the meaning of Being remains that which is always left unthought.

With the question concerning Being and time, Heidegger addresses to metaphysics the decisive question: Is it possible or not to go behind the presupposed understanding of Being? Have metaphysics and its central discipline, the doctrine of Being, i.e., ontology, even got to their own ground if they presuppose that Being must be grasped as presence? If the answer is no, how is time to be thought of within a 'fundamental ontological' investigation, if presence itself is to be thought of from the horizon of time? How is time, within whose horizon the meaning of Being is delineated, to be thought? When Heidegger speaks of Being and time, time does not mean something which stands alongside Being, which perhaps must be superseded if Being itself is to be expressed. Being and time are rather so intertwined that one can be understood on the basis of the other. Neither does time mean that time alongside of which space is situated, but rather, that primordial movement to which even space belongs, a movement which, as Being itself, releases beings from out of itself. That time which is meant in the title of *Being and Time* cannot be understood on the basis of traditional metaphysical thinking at all. Time has a fundamental ontological function in metaphysics, to be sure, since Being is understood, in a hidden manner, as presence from a temporal horizon. Yet, metaphysics obtains no knowledge or understanding of this ontological function, and has no insight

into the ground of the possibility of this function. 'On the contrary: Time itself is taken as a being among other beings, and the attempt is made to grasp time in its Being-structure within the horizon of that inexpressibly naive understanding of Being which is itself oriented toward time' (SZ 26). What time is, is read off from those beings which are themselves in time. In this manner, time itself is naturally not thought of in its Being.

Since Heidegger inquires after Being and time, he must show, in contrast to that manner in which the concept of time plays a role in traditional ontology, 'that and how the central problematic of all ontology is rooted in the phenomenon of time, provided it be correctly viewed and correctly made explicit'. He must critically detach himself from the traditional concept of time 'which has persisted from Aristotle to Bergson, and even later' (SZ 18). Proceeding from the problematic of temporality, Heidegger raises Western metaphysics anew as something concerning which a decision must be made. The second part of *Being and Time*, which was planned but never published, was to have given the 'principle characteristics of a phenomenological destruction of the history of ontology on the basis of the problematic of temporality'. Heidegger had wanted to go back beyond Kant and Descartes to Aristotle, whose treatise on time was to have been treated as 'a way of discriminating the phenomenal basis and the limits of ancient ontology' (SZ 39ff.).

How can the problematic of 'Being and time' – that which is left unthought by metaphysics – be taken up? How can time be primordially intertwined with Being? Being is always the Being of beings and for this reason, the formulation of the question of *Being and Time* can be found via an explanation which interprets beings with respect to time. If Being is to be thought as fundamentally interconnected with time, then time must show itself when the Being of beings is questioned. Among the beings in question, one being assumes a privileged position: Dasein. By Dasein, Heidegger understands man as the 'there', i.e., as the place of the disclosure of Being. It is Dasein which raises the question of Being. Therefore, Dasein which raises the question, must be disclosed in its Being if the question of Being itself is to become transparent. Dasein can ask about Being because it is distinct from other beings in that, in its Being, Dasein is concerned about this very Being. Since the essence of Dasein lies in 'ek-sistence', in its being-able-to-be (*Sein-können*), understanding Being is a characteristic of the Being of Dasein. Thus, Dasein has not only an ontic priority – as being among beings – but also an ontological priority: Dasein is in itself ontological: it has an understanding of Being. This does not mean, to be sure, that Dasein immediately develops an ontology as a questioning after Being which is simply transparent to itself. Dasein's being-ontological is at first merely a preontological, unclear, and unconceptualized understanding of Being.

However, Dasein not only understands itself in its Being, but also the Being of beings which are unlike Dasein. The soul of man, as metaphysical tradition says, is in a certain sense everything that is. Thus, Dasein becomes the ontico-ontological condition for the possibility of all ontologies (SZ 11ff.).

Dasein, as a privileged being, must first of all be explained in its Being, if ontology, the science of Being, is once more to be raised as a problem, and if access is to be gained to the question of Being and time. The Being of Dasein must show itself as primordial temporality in order that on the basis of the temporality of Dasein, that time, in whose light the meaning of Being comes to be determined, can be thought. That is why Heidegger, during the summer semester of 1923, entitles a lecture course *Ontology or Hermeneutics of Facticity*, and the analytic of Dasein becomes for him the way to determine the meaning of Being. Heidegger forces into harmony here the metaphysical tradition, which thinks Being in a hidden manner in the light of time, and a nonmetaphysical and antimetaphysical tradition, which brings the temporality and historicity of man's factual ek-sistence into view. Or more precisely, Heidegger's thinking proceeds from that utmost tension which is indicated by the titles *Ontology or Hermeneutics of Facticity* and *Being and Time*. Since one was unable to relive the tension of this course of thought in the way that Heidegger did, his thinking was misunderstood on the one hand as a traditional, static ontology, and on the other hand as a historicism radicalized into an existentialism.

Since Heidegger poses the question of Being on the basis of man's understanding of Being, he, in a certain sense, led to transcendental philosophy. Husserl had radicalized phenomenology into a doctrine of transcendental constitution, and Heidegger places himself in the context of this school of thought. Husserl had attempted to open up for philosophical investigation that region of primordial origins in which the constitution of every being occurs. *Being and Time* is dedicated to Husserl: Heidegger takes over Husserl's orientation toward questions of origin, and in his analytic of Dasein inquires after the mode of Being of that transcendental ego which carries out the constitution of beings (*des Seienden*). He grants Dilthey, as well as Husserl and Scheler that they, indeed, no longer grasp the person as something 'thing-like', or as a substantial entity. And yet, Heidegger says, the actual mode of Being of the person has not yet been made properly clear and has always been covered up time and again by the traditional anthropological determinations (SZ 46ff.). Such determinations remain oriented within the traditional and inadequate conception of Being, even then and precisely then, when the person is no longer 'reified' as a mere thing and is determined directly through 'nothingness'. The question of the mode of Being of that being 'in which "world" becomes constituted', is, as Heidegger wrote to Hus-

serl, the central problem of *Being and Time*. 'It must be shown that the mode of Being characteristic of human Dasein is totally different from that of all other beings, and that precisely this mode of Being, such as it is, contains the possibility of transcendental constitution.' Heidegger's transcendental ego, however, is not the *cogito* of Descartes and not the pure consciousness of Husserl. Rather, it is 'ek-sistence' taken as the essence of Dasein and characterized by Being-in-the-world, care, finitude, temporality, and historicity. 'Transcendental constitution is a central possibility of the ek-sistence of the factual Self. . . .'²

In the *cogito sum*, the mode of Being of the *sum* must again become problematic, if the meaning of Being is to be successfully determined as no longer oriented toward 'thing' and 'substance'. On the other hand, the mode of Being of the *sum* cannot be properly determined without a deepened determination of the meaning of Being. On the one hand Heidegger's 'ontology' must not be understood on the basis of the pre-Kantian ontology, which was oriented toward things, but from the critical, transcendental-philosophical point of departure; on the other hand, Heidegger's transcendental philosophy is oriented from the very beginning toward that Being which supersedes beings to such an extent that it is 'transcendence per se'. Heidegger thus uses the term 'transcendental philosophy' not only in Kant's sense, but also in the sense of the scholastic doctrine of transcendentals (SZ 38). In his Kant book (1929), he treats Kant's transcendental philosophy as metaphysics, i.e., ontology. He attempts to show, in the same sense in which he formulated the problematic of *Being and Time*, that the foundation of transcendental philosophy collapses and the abyss of metaphysics becomes revealed when the I think of the transcendental ego is seen in its primordial relationship to time. Thus, that which was left unthought by metaphysics is now finally allowed expression.

The fundamental ontology of *Being and Time* is concerned with that which metaphysics has left unthought and thus, with the ground (*Grund*) and the abyss (*Abgrund*) of all metaphysics and ontology. The structure of the first part of this work is determined by the attempt to tear thought away from its orientation toward things and to lead it back to its ownmost self and its temporality so that, through the clarification of transcendental constitution, it becomes possible to give a determination of the meaning of Being. In the first part, the basic structures of Dasein are outlined. Here it becomes clear also, why traditional and, in particular, our everyday thinking is oriented toward things that are present-at-hand. The second chapter shows that ek-sistence, in its essence, is temporal and historical, and thus makes transcendental constitution possible. In the third section, which was not published then, the temporality of Dasein, as that being which understands Being, was to have been treated as the transcendental horizon of the question of Being, so that within this

horizon, the determination of the meaning of Being which was the main issue of these investigations would have been made possible, and thus ontology would have been brought back to its ground, i.e., its foundation, which had been up to that point left unthought.

Since thought is placed in a primordial relationship to temporality and historicity, this investigation can reach a ground only there, where it always already is, i.e., in history. Since there can be no radically new beginning on the basis of 'the things themselves' (as Husserl had required), Heidegger himself introduces the destruction of metaphysics, the return to the primordially historical, into phenomenology. There can be no systematic presentation apart from such a destruction. Therefore, Heidegger adds to the first, more systematic section of *Being and Time* a second, more historical section. Yet, the basic issue here is not the juxtaposition of the two sections, but rather their interdependence. The first section is permeated with 'historical' references; the second is concerned with a 'systematic' task.

I would like to attempt to establish the point of departure of *Being and Time* somewhat more precisely by means of a few more references to the published portion. The first section of this work gives a 'preliminary analysis of the fundamental characteristics of Dasein'. The fundamental structure of Dasein is described as Being-in-the-world. This structure is then examined according to its various moments, and finally grasped in its unity as care. Dasein is not to be thought of as a worldless subject, from which (at least since Descartes) the attempt had to be made repeatedly to bridge the gap between it and the 'world'. Dasein, as Being-in-the-world, is always already alongside of things. While Husserl's constitutive phenomenology attempted to clear the way to an absolute, all-constituting ego, Heidegger posits, as the essence of man, the 'there' of that Being which makes human being possible in such a manner that it always already places man in the totality of beings, as oriented toward things. Phenomenological constitution is made possible by means of a Being which is not at our disposal. Thus, phenomenology becomes ontology for Heidegger. Ontology no longer furnishes merely the guidelines for phenomenological constitution, and no longer merely precedes phenomenology, as in Husserl. Phenomenology rather refers to the method, whereas ontology designates the content of one and the same enterprise.

The tendency of metaphysics to trace everything back to an ultimate ground is once more realized in Husserl. In the modern era, this ground has been found in an unconditioned subjectivity. Heidegger breaks this 'will' toward an unconditioned subjectivity. Being, which is not at our disposal, places man into the totality of all beings, but in such a way that man comports himself to beings as beings, and thus is the clearing, the 'there' of Being. The fact that Being is not at our disposal holds

sway over man as his 'dispositionality' (*Befindlichkeit*). This reveals the fact that man finds himself (*sich befindet*) within the totality of all beings. This 'dispositionality' also opens up access to nature thought of in a primordial manner or, as Heidegger later says, the 'earth'. The Self is understanding determined by mood, and not pure consciousness. The point of departure from pure consciousness stems from an unsurmounted Cartesian dualism; it cannot be completed by a consideration of man's 'bodiliness' since man is neither body and soul, nor mind as a synthesis of both, but rather the factual Self. 'The one-sided observations of somatology and pure psychology', observes Heidegger with regard to Husserl,³ 'are possible only by reason of the concrete whole of man which, as such, initially determines his mode of Being.' Heidegger is concerned with the concrete wholeness of man when he determines Dasein as factual ek-sistence, as the unity of thrownness and project, or of moodedness and understanding. Dasein is just as little a worldless 'I' or a pure consciousness as it is an isolated individual. Rather, it is always already with others, and even arises primarily in the 'Anyone' (*das Man*).

Dasein is, however, not alongside of things and with other people in the sense that it conceives of them in a purely theoretical attitude as abstract entities, merely present-at-hand. Rather, everything is bound to a 'for-the-sake-of-which' made possible by Dasein's being-able-to-Be. Thus, things are not primarily presented in the temporal mode of presence characteristic of what is present-at-hand, but enter into a more primordially thought temporal design (*Zeitspielraum*). Being is no longer revealed by the *intuitus*, which is oriented toward seeing and directed toward the being-present of what is present-at-hand, nor even by Husserl's *intentio*, but by care. The intentional relationship becomes rooted in that achievement of Dasein which is concerned with the 'meaningfulness' of things, and which thus is always factual. That which is in the world is, philosophically, not first discovered in its pure potentialities, in order afterwards to receive back its factual being in a colorless and totally empty realization. Rather, facticity – which is irreducibly unique and historical, and thus cannot be converted into an idea – has already entered into the world. Heidegger's historical conception of world is oriented toward the New Testament, toward Augustine and Dilthey, but not toward the Greek conception of the cosmos. Heidegger accuses the ontological tradition (which originated from Greek thought) of having passed over the phenomenon of the world – and explicitly in Parmenides – even at its very beginning and of continuing to pass it by (*BT* 100). In place of the unrecognized world-phenomenon, a distinct region of eternal entities arose. For this reason, 'even the relationship to the world, in the sense of a distinct comportment to this being, was interpreted as νοεῖν, as intuitus, as no-longer mediated perception or reason'.⁴ Heidegger wishes to turn this tradition of thought back to a more primordial

experience when, in *Being and Time*, he begins with a clarification of the structure of Being-in-the-world.

The analysis of Dasein, furthermore, lets one grasp why the traditional understanding of Being is governed by an inadequate ontology of what is present-at-hand (SZ 130) and a logic (SZ 129) that is grounded therein. Because Dasein is Being-in-the-world, it is 'proximally and for the most part fascinated by its world' (SZ 113). In this manner, Dasein does not take the world as such into view. Because it is a characteristic of Dasein that it is thrown in among beings it remains, as long as it is, 'being thrown'. It is cast into the swirl of that inauthentic understanding of Being which arises from having fallen prey to beings. The constant danger of fallenness belongs to Dasein, which as Being-in-the-world is 'in itself tempting' (SZ 177). As Being-in-the-world, Dasein not only falls prey to beings, but even understands itself on the basis of thinglike beings; it lifts these beings out of their movement and the ever-changing relationship to itself; it assures itself of them by going beyond things which are present and merely present-at-hand, to something eternally present and always present-at-hand. When Heidegger speaks of presence-at-hand, he does not wish to discuss primarily the question of the reality or the 'independence from consciousness' of things, but rather, to point out that sudden changeover by which the original relationship to things becomes a mere seeing of something merely present-at-hand. This changeover is not only factually present in our knowledge; it is the ideal of our traditional conception of knowledge. 'The idea of the *intuitus* has guided all interpretations of knowledge from the beginnings of Greek ontology until today, whether or not that *intuitus* can be factually reached' (SZ 358). Thus, since Descartes, mathematical thinking has been given a priority, because thinking was always oriented toward the eternally present. Mathematics, however, is concerned with that which is always present, always remains, and outlasts all change. And it is precisely mathematics which reveals the all-leveling changeover from our primordial relationship to things to a mere 'presence-at-hand' in its final radicality (SZ 96).

It is precisely because Heidegger retrieves ek-sistence from fallenness that he can primordially unveil the temporality of ek-sistence. The second section of *Being and Time* shows that the 'essence', i.e., the ontological meaning, of Dasein lies in temporality, and that care as the articulated structural totality of the Being of Dasein is to be understood in terms of temporality. The result is a deeper understanding of the fact that Dasein is tempted to fall a prey to being, and thereby to become inauthentic. Inauthentic thought and behavior are oriented toward that which is in time, and in this manner are set in opposition to authentic thinking and behavior, which grasp themselves as the temporalization of time. The determination of Dasein in terms of temporality expresses a decision in regard to the metaphysical concept of time. This conception of time

ultimately remains oriented toward that which is in time, and thus fails to grasp primordial temporality, the temporalization of time itself. Primordial temporality is historicity. Still, the temporality of the 'common' conception of time; which is oriented toward what is in time, is equiprimordial with historicity and is, in a sense, thereby justified (SZ 377). Dasein, as the temporalization of time and thus as transcendental constitution, is only historical and world-founding insofar as it (as factual ek-sistence) is already in the world alongside beings that are in time. Everydayness and inauthenticity cannot simply, once and for all, be left behind. Dasein can only be authentic when it continually tears itself away from inauthenticity, which thus is always already presupposed.

The unfolding of the temporality of Dasein into the equiprimordial structures of historicity and inner-temporalizing shows the ontological direction of the analysis of Dasein, whose goal it is to reveal temporality as the horizon of the understanding of Being, and to gain a victory over the metaphysical understanding of Being. Yet even the analyses of the second section, such as those of death and conscience, which at first seem to be solely an ek-sistential appeal, serve primarily an ontological purpose, provided they are properly understood. They sharpen the insight that Dasein, as factual ek-sistence, is temporality rooted in moodedness or thrown project (*geworfener Entwurf*). As understanding or as being-able-to-Be, Dasein is possibility, but it is authentically this possibility only when it constantly anticipates the utmost unsurpassable possibility. This utmost possibility is death. To die – 'i.e., to feel death as present (Luther)' – deepens that possibility which Dasein is, to the utmost possibility which is boundless impossibility, namely, the impossibility of each and every mode of ek-sisting as a determinate being-able-to-be. That possibility which Dasein, as being-able-to-be, *is* springs from an ultimate impossibility of anticipating this utmost possibility as an anticipation of an ultimate impossibility, in that it gives Dasein to understand that it is 'guilty'.

Being guilty does not mean here the incurring of moral guilt but, quite formally, 'being the ground of a negativity'. With regard to its first aspect, this negativity arises from the fact that Dasein has not laid its own foundation, which is its thrownness, but must nevertheless accept this thrownness. Through the acceptance of this thrownness, Dasein must itself become this foundation, which yet is not Dasein itself but which Dasein must rather always first let be given to itself. It 'has been released from its basis, not through itself but to itself, so as to be as this basis' (BT 284f.). When Dasein, as the understanding of Being, resolutely brings itself before Being, the access to Being shows itself as determined by a 'not'. Dasein is powerless before Being. Dasein is always already in debt to Being because Being proves itself to be the condition for the

fact that Dasein is. This having-to-go-into-debt of Dasein appears in Heidegger's later works in a new fashion, as thinking is brought into a relatedness with thanks and thanksgiving. In *Being and Time* the concept of guilt does not, therefore, accentuate a 'dark aspect' of Dasein, but is much more part of the attempt to find an ultimate foundation for thinking, as was attempted by Schelling in a similar, though metaphysically speculative, fashion. Schelling, after his *Investigations concerning the Essence of Human Freedom* thought he could go beyond Hegel's metaphysics by means of a more deeply laid foundation for metaphysics.

Yet, being-guilty as the basis of negativity still has a second aspect, and Heidegger's analysis derives this aspect, too, from that type of thinking which the late Schelling attempted to develop under the heading of 'positive philosophy'. Dasein is not nugatory merely as a result of its concrete project insofar as this project is a distinct choice, which may choose one thing only while, at the same time, having to give up something else. Thrownness has always already marked off a region of possible choices. Dasein discovers its factual possibilities in resoluteness, and thereby its Being-in-position as a Being-in-a-position, i.e., as situation. Resolute ek-sistence is certain of its own truth only insofar as it takes note of the 'situational' character of this truth. Ek-sistence should not become frozen in one determinate situation, but must leave itself free for a possible taking-back or a resolute repetition. The truth, in which ek-sistence stands, is thus always 'located'. Its light streams into the openness of a 'there', which is distinguished by a situation, and therefore also by temporality and historicity. Being gives itself only into a bounded openness, and is to this extent characterized by a 'not' (*Nicht*). This imitation cannot be overcome by a speculative metaphysics of history.

The ontological aim of *Being and Time* is obvious throughout. This goal leaps into view if one casts only a first, superficial glance (and this, of course, without some sort of self-induced blindness) at the basic concepts, inasmuch as they are characteristic of Heidegger on the one hand, and of the metaphysical tradition on the other. In Heidegger, a radical isolation takes place which leads to an always factual ek-sistence. (This ek-sistence need not be a single individual, but may also be a community.) Within the metaphysical tradition, on the other hand, facticity is seen as mere realization. The irreplaceability of each Dasein does not come into view, and the situation, as historical localization, is left unconsidered. Metaphysics does not orient itself toward the openness of the future as a tensely drawn possibility, which arises out of an utmost impossibility, but rather toward 'reality', which then is transcended toward a compelling, eternal necessity. If no eternal soul substance can be found in the Self, there is certainly still a pure subjectivity which remains constantly present-at-hand through all changes from subject to subject. The constant

unrest in the being-able-to-Be of man's ek-sistence is stilled. Eternity, as continuously abiding presence, takes the place of temporality and historicity. Thus, in the search for something eternally certain and perpetually present-at-hand, which one can cling to, all sense of being threatened is left behind. Thinking steps out of primal uncanniness and makes itself at home in something eternally present-at-hand. Man's resting in this eternity overcomes all being-guilty and all negativity. Finitude enters into an endless being-with-itself.

Heidegger's exposition of the basic concepts of metaphysics finally focuses on the question of whether or not Being can be understood as continuous presence. Does not an understanding of Being which grasps Being as continuous presence shrink back from the actual task at hand, namely that of bringing the temporal character of this presence to expression? These questions were to have been worked out in the third and unpublished section of *Being and Time*, which had as its task the 'explication of time as the transcendental horizon for the question of Being'. The fact that Heidegger increasingly put off matters until they could be treated in this section and in the investigations which were to follow it indicates to what a great extent the whole work was directed toward this section. Thus, the discussion of the forgetting of the world by Western thought (100), the new determination of logos (160), the fuller development of the idea of phenomenology (357), ontology (230), and science (357), and the discussion of the problem of language are all postponed for later treatment. The 'as' in 'taking-something-as-something' and therewith presence-at-hand and readiness-to-hand are to be later clarified (333, 351, 360, 366, 436f.); everydayness is to be more deeply understood (372); the relationship of space and time worked out anew (368); and the question of how time has its own mode of Being is to be answered (406). The whole ek-sistential analysis demands a 'renewed recapitulation within the framework of a fundamental discussion of the concept of Being' (333, 436). The published portion of *Being and Time* therefore quite concretely fails to hit the mark. For this reason, Heidegger states quite explicitly at the end of the published portion that what he has done is only a way, i.e., a way toward working out of the question of Being.

The working out of the question of Being is the attempt to inquire into the meaning of Being as such, whose characterization remains simply an unthought presupposition of metaphysics. In the introduction to *Being and Time*, Heidegger explicitly gives an 'exposition of the question of the meaning of Being'. All questioning, he says there, asks about something, namely, that which is asked about (*das Gefragte*). It inquires after that which is asked about in that it asks something. It has in addition that which is interrogated (*das Befragte*). That which is asked about is

determined by that which is interrogated and is directed toward that which is to be found out by the asking (*das Erfragte*). 'Furthermore, in what is asked about there lies also that which is to be found out by asking; this is what is really intended' (SZ 5). In the question of Being, that which is asked about is Being. That which is interrogated are beings, and among these beings, one being, i.e., Dasein, in particular. That which is to be found out by the asking is the meaning of Being. The published portion of *Being and Time* gives an analysis of that which is interrogated, i.e., Dasein, but purely for the sake of that which is asked about, i.e., Being. Nevertheless, the investigation does not reach that which is to be found out by the asking, i.e., the meaning of Being. Thus, the investigation fails to reach its goal and is prematurely broken off.

This is not to say that the investigation was not leading up to that goal. To be sure, Heidegger does not ask about some Being-in-itself beyond the world – for in this case, Being would simply be a determinate being once more – but asks rather about the meaning of Being, and thus, he asks the question of how Being is revealed to man. To ask the question concerning the meaning of Being means to ask about a possible understanding of Being. 'Meaning is that wherein the intelligibility of something maintains itself' (SZ 151). The meaning of Being means that horizon of understanding in which Being is revealed (not, however, an 'ultimate meaning of Being'). Within this horizon, Being enters that primordially thought truth which Heidegger calls nonconcealment. Being – not beings – is only 'insofar as truth is' (BT 230). Being 'is' as truth, as the openness and intelligibility of beings, as that clearing in which beings may appear. The meaning, i.e., the truth and openness of Being, 'is' only in the *Da* (i.e., there) of Dasein, which is nothing other than a realm of openness. The question of the meaning of Being and the question concerning Dasein's being-understanding aim, even though from different directions, at the same central point, in which the meaning of Being and Dasein's being-understanding are one. 'But to lay bare the horizon within which something like Being in general becomes intelligible, is tantamount to clarifying the possibility of having any understanding of Being at all – an understanding which itself belongs to the constitution of the being called Dasein' (SZ 231).

The clarification of the understanding of Being is carried out in the published portion of *Being and Time*. The Being of a being, i.e., the meaning of the Being of Dasein, is determined so that Dasein may show itself to be the place of the truth of Being, as the one who understands the meaning of Being. Since Heidegger grasps Dasein primordially as the temporalization of time, authentic ek-sistence is revealed as that place in which Being can be temporal. Time is thus able to disclose itself as the horizon for any and every understanding of Being. 'The projection of the meaning of Being in general can be carried out within the horizon

of time' (SZ 235). *Being and Time*, taken in its basic intention, aims at this turning point in which the thinking of the temporality of Dasein enters into time as openness, as the meaning or truth of Being. Yet precisely there where Heidegger finished his preparations and arrived at his ownmost formulation of the question, he lacked the appropriate language in which to express his basic intention. He thus broke off the attempt. Since only the first two sections of *Being and Time* were published, there arose the misunderstanding that the so-called 'reversal' (*Kehre*) indicated a turning away from an earlier (ek-sistentially philosophical) position to an (ontologically historical) position which had been worked out later. A glance at the course which Heidegger's thinking takes, however, makes it quite plain that the published portion of *Being and Time* was already thought out on the basis of the 'self-reflective' consideration of the relationship of Being to beings or (as the case may be) of beings to Being. Furthermore, the work itself shows that, from the very beginning, man's ek-sistence enters into play only from a consideration of the 'reversal'. *Being and Time* begins with an exposition of the question of the meaning of Being; indications are constantly given that the analytic of Dasein is on the way to a determination of the meaning of Being, and actually already presupposes a conception of this meaning and therefore is caught up in a circle. The completion of the 'reversal' is not turning to a new position but rather a return to the original point of departure and a return to that ground upon which this circle-of-thought has rested from the very beginning. This ground is, of course, not only the basis of Heidegger's own thinking, but also that which was left unthought by metaphysics.

The break

Why, we must ask, does Heidegger prematurely break off what was attempted in *Being and Time*, and how does he still manage to bring his thought to its goal? In *Being and Time*, it is stated that 'that which is to be found out by the asking', i.e. the meaning of Being, demands its own manner of being grasped, which manner may not be oriented toward beings (SZ 6). In the *Letter on Humanism*, then, Heidegger admitted, in retrospect, that the thinking of *Being and Time* denied to the 'reversal' an appropriate language, because it could not be carried out within the language of metaphysics.⁵ Metaphysics conceives of beings as beings; it inquires after the Being of beings, but not after Being itself. Metaphysics thus presupposes a determinate conception of the meaning of Being, merely insofar as it does not think through the character of that time in whose light Being becomes determined. Thus, the conceptual framework of metaphysics prevents the question of Being itself from being raised. In fact, this question simply fades away if the questioning does not give up the language of metaphysics. Heidegger has attempted to substantiate

this thesis through a reflection on the thought of Ernst Jünger, a contemporary of Heidegger's on this path of thought.⁶ Jünger believed himself to have gone beyond the 'zero meridian' of nihilism, and yet his conceptual framework still remains within the sphere of metaphysics. If, however, the question concerning Being itself is the first and only fruitful step toward the overcoming of nihilism,⁷ then the conceptual framework of classical metaphysics must be abandoned, since it does not allow this question to come into focus. After the failure of *Being and Time's* endeavor, Heidegger still attempts to bring his questioning to its destination, in that he seeks radically to overcome metaphysics by a *return into the ground of metaphysics*.⁸

The question of the meaning of Being brings that which metaphysics leaves unthought and ungrounded, i.e., the abysslike ground of metaphysics, to expression. An excursus through the history of metaphysics (which the second portion of *Being and Time* was supposed to have attempted) must reveal the abysslike ground so that thought, by means of its own questioning, may return into it. Heidegger now considers above all the beginning, the completion, and the end of metaphysical thought, from the earliest Greek thought, to the philosophy of mediation of German Idealism, and to Nietzsche. Nietzsche is not treated as that existential thinker whose utterances must be held in suspension. Rather, Nietzsche is drawn quite close to Aristotle, and taken simply in his most basic ideas. As a metaphysical thinker, Nietzsche thinks from the idea of the eternal recurrence. Yet, as a 'thinker of eternity', he is not the prelude to a philosophy of the future, but rather, the consistent end of the metaphysical tradition. Metaphysics represents beings in their Being, but in this representation it relates them to subjectivity. This subjectivism, which was present from the very beginning in metaphysics, finds its radical completion in Nietzsche, who made the will to power the *essentia* of all beings. Metaphysics thinks Being as perpetual presence: metaphysics reaches its completion when Nietzsche determines the *existentia* of beings to be the eternal recurrence of the same. Nietzsche's doctrine, as the doctrine of the eternal recurrence of all things, overthrows the metaphysics of essences because now there can no longer be any essential difference between things. Thus, metaphysics ends with Nietzsche. Heidegger seeks not only to bring metaphysics to this end, but even the whole of Western history which, even in the phase of our scientific-technical organization, is still determined by metaphysics. Heidegger understands the all-destroying world wars of our time in the light of the final history of metaphysics. He interprets metaphysics and its end with the help of the concepts and catchphrases of total war.

Nietzsche's attempt to overcome nihilism does not overcome nihilism at all, but rather entrenches it all the more firmly. In a thought which thinks from the viewpoint of the will to power and the eternal recurrence

of the same, Being cannot appear in its truth, cannot appear as that destining (*Geschick*) which it, in fact, is but which is 'not simply at our disposal'. As Heidegger stated in his Nietzsche lectures during the summer semester of 1939, 'In the eternal recurrence of the same, the final historical essence of this last metaphysical explanation of beingness [*Seiendheit*] – i.e., as the will to power – is conceived of in such a manner that the essence of truth is denied any possibility of becoming that which is most questionable, and the meaninglessness which is thereby placed into power unconditionally determines the "horizon" of our times and brings about its completion'.⁹ The completion of meaninglessness reveals itself to the historical-technical consciousness of our time not as the end, 'but as the "liberation" for a steadily-increasing loss of Self, and ultimately, to an intensification of everything'. 'One neither knows nor ventures that Other, which in the future will be the One and Only, because it was already abiding in the very beginning of our history, even though ungrounded: the truth of Being, our standing in this truth, out of which world and earth alone struggle to achieve their essence for man, and man, in this struggle experiences the reply of his essence to the God "of" Being'. Only in a new experiencing of Being can nature and history find man and God in their essence. Since the end of metaphysics forcibly brings about this new beginning, i.e., of a 'standing in' truth insofar as essential thinking should continue to exist at all – thinking is obliged to repeat the first beginnings of thought, the earliest Greek thought, and redecide all those decisions on the basis of which metaphysics arose. Heidegger demands to go back into the ground of the first beginnings of thought. 'What has been in the first beginnings of thought is thereby forced to rest upon the abyss of its ground, which has remained ungrounded up until now, and thus, for the first time, to become history.'

This newly beginning thought, which arises from the end of metaphysics, raises once more the question which *Being and Time* had to leave unanswered. The completion of the reversal, toward which *Being and Time* not only tended but out of which this whole work was already conceived, cannot simply be considered a further carrying out of the point of departure of *Being and Time*. The 'reversal', as Heidegger actually carries it to completion, is a turning away from this first point of departure, which still asked about the Being of beings in the metaphysical manner of questioning. Just as a skier does not make a turn arbitrarily or out of pure high spirits, neither does Heidegger arbitrarily break off the train of thought of *Being and Time* just when it is in full motion. An abyss had opened up before him, the abyss of the meaningless which had been revealed by Nietzsche's bringing metaphysical thinking to a close.

Thought cannot simply by-pass this abyss. Insofar as thought does not wish to carry out merely an underground restoration and ever again fall

into the same abyss, it must itself enter this abyss. Thought must go through metaphysics to that which remains unthought in metaphysics; it must appropriate metaphysics before it can abandon it. That is why Heidegger asks the question: *What Is Metaphysics?* (1929), why he attempts an *Introduction to Metaphysics*,¹⁰ which aims at a basic overcoming of metaphysics. Already the fact that Heidegger takes up the leading concepts of metaphysical thought in order to do away with them one after the other, indicates that he wishes to overcome metaphysics by appropriating it and thinking through it to that which it left unthought. Metaphysics is simultaneously ontology and logic. Already in his Kant book, Heidegger rejects formal and transcendental logic (in contrast to Husserl's efforts at that time). Formal logic, he says, must be deprived of its privileged position in metaphysics, which it has maintained since antiquity. The very idea of a formal logic is questionable. The idea of a transcendental logic is simply meaningless.¹¹ In the *Introduction to Metaphysics*, the heading 'ontology', which was first adhered to, is rejected also. Heidegger wishes to separate himself from other contemporary 'ontological' efforts in philosophy (p. 31). The *Letter on Humanism* thus states that ontology – in keeping with its name – always thinks only the meaning of beings, and therefore not Being itself. Heidegger seeks first of all to establish a connection between the sciences and the wanting-to-have-an-awareness of Dasein. However, the sciences, which supposedly were to have been metaphysically grounded, finally become mere derivatives of a metaphysics which itself is to be overcome. This consideration, which takes up the wanting-to-have-an-awareness of Dasein on a new level, is placed in opposition to the sciences. The later Heidegger does not wish to have his thought understood as phenomenological research or even as philosophy. That is why he now seeks out art. Art emerges out of an inner necessity into the horizon of the thinker who prepares himself to think the truth of Being: primordial art, of whose end metaphysics speaks, sets the truth of Being into motion; it makes beings 'more being' (*seiender*) by guarding Being in beings. The disclosure of the world, as it occurs in art and, above all, in poetry seems to be the only one which stands on that primordial level upon which thought, too, seeks to make itself at home. Thought itself has a hidden poetic character because it no longer is the metaphysical proposing presentation of beings in their Being as continuous presence, but reaches out into an open future, thereby bearing presence and absence simultaneously. At this point Heidegger comes close to early Greek aphoristic thinking as well as to the more recent Western 'sayings of the soul which should be sung rather than spoken' – an expression through which Nietzsche for some time laid himself open to the experience of the god Dionysus, who is simultaneously presence and absence.

Yet it is not a 'poetry' beyond metaphysics which leads into the abyss-

like ground of metaphysics, but rather the attempt to retrieve primordially the questions of metaphysics. Shortly after *Being and Time*, Heidegger attempts in the lecture *What Is Metaphysics?* and in the essay 'The essence of reasons' to reflect upon the 'Nothing' (*das Nichts*), and upon the Nothing between Being and beings, i.e., the ontological difference. In this way, Heidegger meets the demand which he himself had made in the analysis of guilt and conscience in *Being and Time*, namely, the demand to raise the problem of the ontological origin of Nothing (SZ 285ff.). Since Nothing is thought of as a 'no' with regard to all beings, the question arises of why there are beings at all, rather than Nothing? Not only facticity of Dasein, but even the fact that there are beings as such is called into question in this metaphysically greatly expanded problem. When metaphysics asks something of this nature, it turns to a highest being as the ground of all other beings. In this fashion, however, metaphysics does not think Being as such. By including in his question a '... rather than Nothing' Heidegger cuts off the path to a highest, unquestionable Being. He reduces this question to the question of the meaning, the truth or openness of Being itself. In the leading question of metaphysics – i.e., What are beings? – which asks about the Being of beings, the fundamental question is presupposed, in which the meaning of Being itself – that which is left unthought by metaphysics – is brought into question.

The meaning or the truth of Being, as that which metaphysics leaves unthought, is the abysslike ground of metaphysics. The truth of Being is that center in which being and Dasein (which has an understanding of Being) come together, in which the 'reversal' thus completes itself. That thinking which wishes to bring the abysslike ground of metaphysics to expression must enter into this center. Heidegger reflects upon this center when, in the two decades after the appearance of *Being and Time*, he makes the problem of truth and Being the foremost theme of his thought. The lecture 'The essence of truth' and the essay 'Plato's doctrine of truth' give some insight into his working on this theme. Heidegger reflects upon the unthought foundation of the Western conception of truth, that non-concealment which must ever again be wrested from forgottenness and hiddenness, and which thus first makes truth as the *adequatio* of thought and thing possible. Truth, which is thought of as a nonconcealment, is the happening of truth (*Wahrheitsgeschehen*), and in this happening prevails the temporality of Dasein and that time in which Being itself gives itself in its openness. We are concerned here not simply with the essence of truth in the sense of Dasein's standing-in-truth, but rather, concerned even more with the truth of Being taken as abiding Being, i.e., with truth as the openness of Being. In this way, the 'reversal' is completed: Dasein as Being-in-the-world no longer stands at the center of these considerations, but rather Being in its meaning and its truth,

and thus Being as that which makes 'world' possible. Thought no longer moves from beings to Being, but rather from Being to beings.

If the relationship of Dasein to Being is determined by a double nothing then Being in its transition to beings is characterized by a double 'superiority'. There is, of course, no Being without beings – Being is the 'granting' of beings – but yet, Being brings about in itself the difference between Being and beings. It releases beings out of itself into openness, and among these beings there is Dasein as the privileged place of Being's openness. However, for its part, Dasein, taken in itself, does not have Being at its disposal. To this a second aspect is to be added, namely, the place of the openness of Being is bounded by the fact that at each given time it 'whiles' in a determinate way (*Jeweiligkeit*): the openness or nonconcealment of Being takes place at each given time only upon a background of concealment. Being, which appropriates Dasein as the place of its disclosure, remains fundamentally not at Dasein's disposal, just as it ever again transcends the mode of abiding characteristic of Dasein.

Being, taken as the unavailable and at each time historical destining of Being (*Seinsgeschick*), reveals itself in its meaning, or in its openness and truth, as the event of appropriation (*Ereignis*). 'Ereignis' does not mean here, as it still did within the terminology of *Being and Time*, a certain occurrence or happening, but rather Dasein's complete self-realization in Being, and Being's appropriation (*zueignen*) to Dasein's authenticity. The word 'Ereignis' cannot be made plural. It determines the meaning of Being itself. It is, as a *singulare tantum*, a key concept of thought like the Greek word *logos* or the Chinese word *tao*.¹²

Being as the event of appropriation: with this definition Heidegger's thinking has arrived at its goal. In the event of appropriation, time, in whose light Being has always been understood, though in a hidden manner, is simultaneously thought also. Heidegger's thinking returns to its own ground in that it brings the abysslike ground, that which was left unthought by metaphysics, to expression. Thus, the way of thought finds its course to the continually circumnavigated center. Thought gradually finds its genuine structure by thinking its only thought. As a carrying out of the question of Being, and thus as the carrying out to completion of thought's way, Heidegger's thinking strictly limits itself to adhering to that one and only thought 'which one day will remain fixed like a star in the heavens of the world': 'To approach a star, and only this. . . .'¹³

Part two

In his confrontation with metaphysics, Heidegger raises the first and last questions of thought anew. Thus, that which was left unthought by

metaphysics achieves expression. Heidegger seeks to think that which was left unthought by returning to the ground of metaphysics. He thinks Being in the sense of the appropriating event. This determination of the meaning of Being was thought through in 1936 but did not appear in an exact formulation until twenty years later.

Because Heidegger thinks the meaning of Being itself, he can take up the metaphysical question of the Being of beings, of Being in its various modes of realization. He seeks to secure beings in the truth of Being. In so doing, he cannot simply take over the logic of metaphysics, but must forcibly bring about a new decision concerning the *logos*.

Through the return to the ground of metaphysics, that which has been thought by metaphysics is posed anew as something which must be decided upon and, in this manner, can be primordially adopted. By means of a meditation which is focused on Being's history, Heidegger reflects upon the characterizations of the meaning of Being which, although prevailing in various phases of metaphysics, were not expressly put into question there. Thus, Heidegger seeks to place metaphysical thinking back upon that ground which itself has remained unthought, to incorporate his own thinking into that 'happening' of the truth as it comes to us from our tradition.

I cannot go further into all these efforts of Heidegger's, of which at least some bits were made available in lectures and essays. Nevertheless, I still would like to attempt three things: First of all, I would like to reflect once more upon the course of Heidegger's thinking as a whole, to be able to more accurately grasp the central point and the inherently tense unity of Heidegger's thought, and thereby ward off some misunderstandings. Thus, I shall pay particular attention to what the word 'ground' (*Grund*) means in the discussion of fundamental ontology and the return to the ground of metaphysics. Secondly, I would like to give at least a few indications of how Heidegger seeks to think that-which-is on the basis of the event of appropriation, and determine the *logos* which his thinking follows in so doing. Finally, I would briefly like to show how Heidegger's thought gains its cohesiveness by placing traditional, metaphysical thought back upon its ground, which has remained unthought.

The ground

Heidegger's thinking grows out of a reflection upon metaphysics. But what is metaphysics? Metaphysics (ontology in the broader sense) seeks to determine beings in their Being, and to articulate Being according to its various modes of realization. This is why metaphysics asks the question: What are beings? At one point, metaphysics asks about beings as beings in general, or about beings as such; then it is general metaphysics (ontology in the narrower sense). Metaphysics, however, does not only inquire after those characteristics which can be discovered in every being,

in beings as such, but it inquires also after that Being which makes a particular, individual being to be what it is. It is then special metaphysics (*metaphysica specialis*). Metaphysics, from the very beginning, asks about beings as beings only in such a manner, that it defines beings as a whole in terms of a privileged being – a highest or divine being. When, in the Christian faith, God was understood as the creator of mankind and the world, theological metaphysics was incorporated into the three parts of traditional *metaphysica specialis* (natural theology, psychology, cosmology).

Metaphysics asks about beings in such a way that it grounds the Being of beings in a highest being, and defines it in terms of this highest being. Metaphysics thinks beings in their Being, but does not determine this Being in its own proper meaning, but rather thinks it immediately in terms of a highest being, which for its part is determined in terms of a meaning of Being which is not thought in itself, as such. Being and beings are not kept apart in such a way that the meaning of Being could become problematic. The meaning of Being remains unthought; its meaning is merely presupposed. Metaphysics, as representative thinking, orients itself toward thinglike beings, which it finds present in the 'world' as present-at-hand. It thus understands Being, and even the Being of the highest being, in terms of presence-at-hand or presence. Since it is never explicitly put into question, this understanding of the meaning of Being takes place only in a hidden manner in the light of time: presence (*Anwesenheit*) is thought of from the perspective of the temporal mode of the present time (*Gegenwart*). It is for this reason that Heidegger asks: If Being is determined as presence, how then is time itself to be thought of which in a hidden manner is cothought with the notion of presence? 'Through the question contained in the expression "Being and Time", that which was left unthought in all metaphysics is indicated.'¹⁴ The question about Being and time seeks to think that which metaphysics has always forgotten to think: the meaning of Being itself.

Heidegger finds an approach to that time in whose light the meaning of Being comes to be determined by examining the Being of that being which is characterized by an understanding of Being, in terms of temporality. That being which is so characterized is Dasein. Metaphysics can find no approach to the question of Being and time because it must interpret time in its Being in terms of a 'now', precisely because it understands Being in terms of an inadequately thought-through temporal mode, namely, 'the present time'. Metaphysical thinking orients itself toward that which is present-at-hand within the world, and transcends this present-at-hand to something which is eternally present at hand or present. Thus, this sort of thinking must overlook that typical standing-out toward a future which is not simply at one's disposal which is characteristic of primordial temporality. Time is grasped as a succession of

now-points which are present, were present, or will be present. Christian theology reveals a more primordial relationship to time and temporality, i.e., a relationship of standing-out toward a future which is not at one's disposal. Heidegger mentions frequently in *Being and Time* the impulses which he received from the theological thought. It is these impulses which have led him to that path which his questioning takes.

Heidegger asks about Dasein and its temporality merely for the sake of the question of Being. The privileged position which Dasein receives does not mean that a subjectification of all beings is to be undertaken. Of course, Heidegger's thought remains separated by an abyss from that kind of metaphysics which, by means of a transcendental reflection, believes itself capable of defining the 'gradation' of beings with respect to Being. But precisely because Heidegger reflects upon the fact that we can approach beings which are not like Dasein merely through that openness which Being receives in our understanding of it, these beings can 'speak' to man in their total otherness and foreignness, without immediately being anthropomorphically misinterpreted. The analysis of Dasein should not be understood as giving support to modern anthropologism in any way. In such anthropologism, man is put into the position of the highest being. Everything which is delivered over to man. Beings are only insofar as they are for man and given over to him. Everything revolves around man and seems to be connected with him. Man, made thusly dependent upon himself, becomes understood as 'nihilistic' in the sense of 'merely temporal' and 'finite'. As a matter of fact, *Being and Time* has been misinterpreted as just such an anthropologism. One was thus forced to regard the thought of the later Heidegger as a turn to a completely different position. In Heidegger's later thinking, the foundation upon which everything is founded is supposed to be no longer resolute ek-sistence, but rather, a mythologized Being.

Yet, neither Dasein nor Being is an ontic fundament, an ultimate ground in the sense of metaphysics. Thus, it is meaningless to say that Heidegger has changed his view by substituting one fundament (Being) for another (man). Dasein is the 'there', the place of the truth of Being, and therefore by no means 'something' different from Being. And yet, there actually is an equivocation in Heidegger's earlier speaking about a fundamental ontology supposedly to be discovered through the analysis of Dasein. It sometimes appears as if the analysis of Dasein were not only the way to the working out of the question of Being, but even prior – if not superior – to it, its 'fundament'.¹⁵ These various 'tensions' which are found in Heidegger's course of thought are obviously not to be simply explained away, for then Heidegger's thought could not be regarded as an authentic 'searching for the way'. One must bear in mind, however, that Heidegger constantly calls attention to the fact that the analysis of Dasein must already presuppose a clarification of the meaning of Being,

and that this analysis must be repeated after the clarification of the meaning has appeared to be successful. Thus, there can be no talk of a one-sided grounding of the question concerning Being through a clarification of man's understanding of Being. Furthermore, Heidegger explicitly puts the equivocation which is inherent in his speaking about fundamental ontology into question at the end of *Being and Time*: 'Can one', he asks, 'provide ontological grounds for ontology, or does it also require an ontical foundation? And which being must take over the function of providing this foundation?' (SZ 436).

It is a characteristic of metaphysics that it presupposes an ontic foundation for ontology, and lets the meaning of Being be determined from the perspective of a particular being. In contrast to this, Heidegger cuts off the path to a highest being, which is no longer questioned in its Being, with the question: 'Why is there anything at all, and not simply Nothing?' In this way, thought enters into the happening of truth, in which the meaning of Being itself becomes revealed. Since Heidegger pays particular attention to the temporal character of this happening of truth, to the concurrence of concealment and nonconcealment, he succeeds in determining the meaning, and therefore the truth, of Being, by explicitly discussing the temporal moment which, as presence, remains hidden in the traditional understanding of Being: Being as the event of appropriation.

That which was left unthought by metaphysics, not merely the Being of beings, but the meaning of Being itself, comes to be thought. In this way, metaphysics comes to its 'ground'. What the word 'ground' may mean here is explained by Heidegger where he rethinks the fundamental concepts of metaphysics: identity, difference, and ground. Heidegger does not simply ask what identity, difference, and ground have to say about beings, but asks rather, how they belong to Being itself, Being as the event of appropriation. The identity of Being is 'self-sameness' (*Selbigkeit*), and not equivalence (*Gleichheit*). Identity articulates beings in their essence in such a manner that this essence remains a 'determining characteristic' (*Eigentum*) of the event of appropriation. The essence of, e.g., technology or poetry, is not the transtemporal validity of an eternally present, unchanging idea, but rather that destined (*geschickt*), historical essence which is not simply at our disposal. This essence reveals itself each time in a strict, but still temporal commitment when Dasein accepts the destining of Being (*Seinsgeschichte*), and as the 'there' of Being is 'identical' with it. Beings can then be understood in their Being as beings. If beings are understood in their Being, the difference between Being and beings is broken open. This difference (*Unterschied*), the ontological difference (*Differenz*), constitutes the center of that thinking which, as meta-physics, transcends being to Being. Heidegger seeks to show how this difference is at the same time the carrying-out of 'overcom-

ing' or transcendence, as well as 'arrival' or presence. Just as Heidegger thinks transcendence from the perspective of Dasein, as the act in and through which Dasein's understanding being-able-to-Be supersedes beings and in which this being simultaneously arrives at a new truth before Dasein's attuned moodedness, he also thinks the transition of Being to beings as the simultaneous arrival of beings in the unconcealment of Being. The carrying out of the difference – the happening of truth – is thought of as the carrying out of the event of appropriation. In contrast to what is the case in metaphysics, Heidegger no longer grounds the transcendence from beings to Being in a highest being which grounds itself and everything else, i.e., a *causa sui*. If Being is conceived of as a 'ground', it not only grounds beings, but must itself be grounded in a highest being. In this way, metaphysics becomes onto-theo-logy: it thinks Being on the basis of the divine as the ground (*logos*) of all beings. Being and beings are then not kept sufficiently distinct, so that Being cannot reveal itself in its meaning and be determined as the event of appropriation. Being itself does not become a problem here. Even the highest being is understood as something eternally present-at-hand, because the understanding of Being has oriented itself above all toward beings which are simply encountered, toward things present-at-hand. Even if, in a new approach, thinking is grounded in an ultimate 'I think', even then this 'I think' is, in turn, understood from the perspective of eternal presence as a 'pure, primordial, unchanging consciousness', which in every consciousness remains the same and thus is its ground.

Metaphysics, as the science of grounds, comes to completion in the technique of an absolute knowing, which makes available an ultimate ground. In contrast to this, thought (in Heidegger's sense) remains directed toward historical Being, which is nondeterminable and not simply at our disposal, and which is thought as the 'destining of Being' (*Seinsgeschick*), as the event of appropriation. The meaning of Being as the 'ground' which remained unthought in metaphysical thinking, can perhaps be thought of as an 'abysslike ground', but in the final analysis cannot really be thought of as a 'ground' at all. The discussion of ground is given up after having been explicitly worked out. Because the event of appropriation is just itself, and nothing more, it is without a 'why?' which asks about grounds or reasons. 'It remains', Heidegger says at the conclusion of his lecture on 'The principle of sufficient reason', 'just play: the highest and the most profound play. But this "just" is everything, the one, the only.'¹⁶

Being as the event of appropriation is neither an ultimate ground nor a highest being, but this is *not* so precisely because it is the 'granting' of beings (*das Geben vom Seienden*), because it is the 'it grants' itself. The 'it grants' (*es gibt*) is not a 'ground for the world': neither is it the power over its 'granting': it is not God, who 'creates' beings. Being as

the event of appropriation gives beings into openness, and allows them to reveal themselves as the Being 'of' beings.

Being as nondeterminable, historical destining of Being which is not simply at our disposal grants at any given time the clearing in which beings become manifest. It thus makes possible the 'bursting open' of the world as an historical world (history to be taken here in the sense in which it is not limited only to man). Since Heidegger seeks to develop a primordial concept of world (world as 'Fourfold'), he overcomes the forgetfulness-of-the-world characteristic of Western ontology which had already been discussed in *Being and Time* (100). Being, as the Being of beings, itself becomes a 'derivative' of world. The more Heidegger enters into his own thinking, the more he leaves metaphysical concepts behind. He even drops the fundamental concept 'Being', because it is a specifically metaphysical concept. He is able to drop this concept because that which metaphysics thought under this heading is the event of appropriation, when it is rethought by means of a reflection on the meaning of Being.

That which is

When Heidegger seeks to think Being in its meaning, when he seeks to think the event of appropriation, this does not mean that he rejects the question of the Being of beings. Rather, this whole question becomes fruitful in a totally new fashion when the meaning of Being is thought of as the event of appropriation. Heidegger's overcoming of metaphysics still maintains a positive attitude toward metaphysical questions. That thinking which on its 'forest trails' (*Holzwege*) abruptly becomes confronted with that which was never before trodden, i.e., the question of the meaning of Being, reaches this question in that it comes out of metaphysics and thinks back through metaphysics to that which metaphysics left unthought. This thinking ever again travels along those paths which metaphysics has opened up for it; it takes up the metaphysical question concerning the Being of what is. 'Does the soul speak? Does the world speak? Does God speak?' These questions conclude the prose piece 'Der Feldweg' (1953). 'Everything addresses renunciation toward the Self-same. Renunciation does not take. Renunciation grants.' The questions of *metaphysica specialis* about the soul, the world, and God are once more brought back into the question about 'that which is the Same', about Being. Thus, these questions can become fruitful in a new sense. The extent to which Heidegger has always borne these questions with him is shown by a mere glance at the course his thought has taken.

At the end of his Duns Scotus book, Heidegger – addressing himself to the scholasticism and mysticism of the middle ages and to Hegel – calls for a 'philosophy of the living spirit, of active love, of the worshipful intimacy with God [*Gottinigkeit*]'.

The sharpest possible distinction

between theology and metaphysics follows immediately upon this leap into the theological metaphysics of the West. He appeals to Luther, who in the name of a 'theology of the cross' rejected the 'theology of glory', which – in its metaphysics understood as theodicy – calls evil good and good evil (as Luther says in the twenty-first thesis of the Heidelberg Disputation). When thought sees itself thrown back upon itself, it must come to grips with Nietzsche who, as the 'last German philosopher who passionately sought God', expresses the fate of the West in his declaration: 'God is dead!' Only in this way can thought, with Hölderlin, enter inquiringly the level of the holy, in which the Divine, God or gods, have the abode where they can appear. Inasmuch as this thought abandons the God of the philosophers as a dead, merely being, and 'defined' God, it perhaps comes closer, as Godless thinking to the 'godly God'. It holds true for this thinking that 'Whoever has experienced theology in its own roots, the theology of the Christian faith as well as that of the philosophers, prefers today to remain silent about God within the realm of thought'.¹⁷

Nature is to be thought primordially as 'earth', so that it can be torn free from both the one-sided objectivization of science, and from technology with its one-sided interest in permanent availability and usefulness. Thus, nature can be experienced anew on the basis of the event of appropriation. Man is no longer thought of as a 'subject', but rather as the one who has to carry out the event of appropriation. The work of art, the thing, language are thought from the viewpoint of the event of appropriation.

The Being of that which is is not simply understood from the perspective of continuous presence, from the 'idea', thought of statically, or with reference to an unchanging universal. Rather, it is asked if the Being or the essence of beings is not to be properly understood as a 'historical abiding' [*Wesen*], from the perspective of the event of appropriation. That thinking which orients itself toward 'seeing', which represents beings as beings with respect to a Being or essence which is continuously present, is transformed into an explaining thinking which grasps the essence of beings as historical abiding, or as the 'place' which at any given time it always gains through the event of appropriation. If truth is to be thought of as a happening, then representational thought must make a fundamental change. It can no longer orient itself simply toward the temporal mode of the present, but rather, must 'stand-out' toward time more primordially. Heidegger has brought this fundamental change in thought to completion by conceiving of ontology as phenomenology, but phenomenology as hermeneutics, and then by going back from hermeneutical thought to a thinking which follows a *logos* that remained concealed in metaphysics, and was not primordially developed either in theological or historical hermeneutics.

The character of Heidegger's thought has been variously misunderstood. It is believed that talk about Being must be completely empty, if Being is not grounded in a being. It was said that ontology was to be placed upon an ontic foundation, e.g., God, or at least an eternal world or man himself. As a matter of fact, that thinking which Heidegger himself characterizes as 'preparatory' is marked by a certain 'emptiness' or formalism (e.g., within the analysis of Dasein, Heidegger distinguished between 'existential' and 'existentiell'). In fact, however, the relationship to beings is already posited along with the thinking of Being. The early Heidegger therefore spoke of the formal-indicative nature of his concepts. The formalism of these 'indications' is not that of an empty, self-sufficient form which is separated from its content. Rather, the relationship to the fulfillment through the content is already posited in the form, but held back and in suspension, so that the formality is maintained. The form is not an empty shell, but rather always ready to make the leap to the concrete through a content. This fulfillment is held back, however, because it is irreducibly factual. That for which resolute Dasein resolves itself, 'which' reveals itself in Being as the event of appropriation, remains open, since thought can neither posit it nor derive it without destroying the character of the event of appropriation.

It has been further said of Heidegger's 'ontology' that it fails to achieve its sought-after formalism, since it springs from a particular-historical understanding. However, this abstract alternative, namely that between the ontological-universal and the ontic-historical, also fails to do justice to his formal-indicative conceptuality.

When Heidegger, in *Being and Time*, brings a particular structure to light, it appears to be a phenomenon in the sense of Kant's 'condition for the possibility of experience', or Plato's *eidos*. The provisional conception of phenomenology, as Heidegger develops it at the beginning of *Being and Time*, must lead one to hold Heidegger's investigations to be eidetic investigations in the sense of Husserl's phenomenology. Nevertheless, whoever understands *Being and Time* in this fashion must be shocked when Heidegger, in this work, quotes Count York's statement to the effect that, with regard to the inner historicity (*Geschichtlichkeit*) of self-consciousness, a systematization which is separated from historiography (*Historie*) is simply inadequate (SZ 401f.). If, however, the meaning of the Being of Dasein lies in its factual ek-sistence, which properly speaking is historicity, then for such a Dasein no purely unhistorical possibilities can be in actual fact essential. The universality of formal-indicative concepts is only a certain sort of 'universality', which always aims toward its fulfillment in that which at any given time is historical. For this reason, Heidegger had already proposed the destruction of a systematization in *Being and Time*. For the same reason, Heidegger later attached the analyses of *Being and Time* to that region

of history where they belong. Thus, it is shown by the lecture 'What is philosophy?' for instance, how that moodedness which as a rule (and thus in a certain universality) determines man is capable of being grasped only with the perspective of a basic mood (*Grundstimmung*), which at each given time is characteristic for an epoch.

The meaning of the Being of Dasein, as grasped through the existential analysis, can just as little be made into an 'idea', as the meaning of Being can be determined on the basis of a statically thought idea. The universal, binding character of Heidegger's thought does not come about through the contemplation of something which is always, ideally present, but rather, because it 'stands out' toward a destining which at any given time makes our historical abiding possible. The identity of this abiding, which achieves only a certain 'universality', is derived from the event of appropriation. The enduring of the destiny, however, is only then binding, and not simply arbitrary, when it thinks from what has been into the future. This thought moves within the circle of historical understanding, and for this reason must seek, in a never-ending motion, to get behind those presuppositions which it has always already made for itself. It 'grounds' itself by moving back and forth in this circle. Of course, it must allow the ultimate 'ground' upon which it rests to be historically handed over to it, as something which is not simply at its disposal. It can never (as in Hegel) supersede this immediacy in an all-grounding dialectic. The final paradox of this thought's circular but never ultimately terminated movement lies in this, that the emergence of the historicity of thought itself happens historically.

Since Heidegger moves within the circle of historical understanding, he must make the initial presupposition of this understanding, i.e., language, a theme for reflection. And thus, it is not an uncritical aspect of thought which manifests itself in his 'etymologizing', but rather a critical aspect: the attempt to put into language those very presuppositions which thought makes when it speaks. Hamann, in his metacritique, once objected against Kant, that the highest and final purification or critique of reason, namely the purification of language, could never be achieved. According to Hamann, language is the organon and criterion of reason: and yet language is historical. However, since Heidegger pays particular attention to the incorporation of thought into historical language, one may also characterize his thought as 'metacritical', at least insofar as it can be measured against critical theory at all.

Of course, one does not recognize the metacritical character of Heidegger's thought in its necessity if one simply keeps staring at his often noted etymologies, or dismisses Heidegger's thinking as 'mere' poetry. It is even possible to gain access to Heidegger's methodological procedure through the Western tradition of thought (and not just exclusively from early Greek aphoristic thought). Heidegger attempts a topology,¹⁸ i.e.,

a saying of the place, and thus a thinking of the truth, of Being, where he analyzes such guide words and guiding principles as '*physis*', '*logos*', 'Nothing is without ground', or 'man dwells poetically'. If we call these guide words and guiding principles '*loci*' or '*topoi*', we gain a second meaning for the word 'topology', a meaning which Heidegger himself, however, does not consider. We may thus connect Heidegger's thinking with a tradition which was once of utmost importance. In his attempt to make a science out of philosophy, Aristotle distinguished 'Topics' or 'Dialectics' from 'Apodictics' as the properly rigorous method of philosophy. Even Vico still made mention, though with somewhat different intentions, of the priority which 'Topics' has over 'critical theory', i.e., over the exact methodology of our era. The Christian dogmatists (e.g., Melanchthon) utilized most decisively and for the longest time, the term '*loci*' because they were striving for a systematization while still having to heed the irreducible historicity of faith. Heidegger's latest endeavors of thought, too, form a topology, i.e., they are designations of the place, or sayings of the place of Being's truth, with the help of a selection of loci or a collection of the guiding concepts and principles of Western thought. Modern philosophy, linguistics, and research into the history of concepts all, in their own particular ways, attempt something similar. Furthermore, the methodically developed limitation to only exemplary guide words and guiding concepts is today a necessity. We have only to consider Dilthey's work, which remained fragmentary, to see that the traditional methods of research in the human sciences are no longer adequate for historical reflection.¹⁹

The later Heidegger, of course, rejects any attempt at constructing 'methods' in order then to reflect upon them. He does not even wish explicitly to propose that manner in which the event of appropriation needs thought as the hermeneutical circle itself. Instead, he wishes in his thought to turn more primordially back to and to dwell in the hermeneutical relationship itself, in which the meaning of Being is 'announced' to Dasein, which already has an understanding of Being (SZ 37). We have seen already that even the formal-indicative concepts are not to be thought of as universal forms, through which representational thought gets a grip upon beings, but rather a guidance toward the happening of truth. The guiding words upon which the later Heidegger reflects are to be understood as clues and indications, which are addressed to questioning thought so that it may enter more purely into the event of appropriation. Thus, as a thought which 'explains' it may gather together everything which is into the event of appropriation.

Hanging-together

To determine Being in its meaning as the event of appropriation, to secure beings as beings in the truth of Being, i.e., the event of appropri-

ation, to attain the '*logos*', i.e., the language which is capable of properly responding to the event of appropriation: this is what Heidegger attempts. That destiny, as which Being itself prevails, which is not at our disposal and cannot be conceptually determined, is to be experienced as such. This experiencing should neither be covered over by a dialectic, in the sense of a metalogic (Hegel), nor should this experiencing be altogether avoided, as is the case when thought, confronted with the traditional conceptual forms, yields to the historical representation of the past, thereby failing to do justice to historicity (Dilthey). This experiencing can be authentically endured only if thought goes through metaphysics and overcomes it, both as ontology and logic, from the 'ground' on upwards.

On the basis of its understanding of Being as continuous presence, traditional ontology grasps the Being of beings as a continuously present, ideal something. Heidegger seeks to ground this ontology through the return to a mode of thought which thinks Being's historical abiding from the event of appropriation. In the same way, he seeks to go back through traditional logic (and not merely to bypass it) to a more primordial *logos*. The young Heidegger wrote: 'What is logic? Already here we are faced with a problem, the solution of which is reserved for the future.' Then as thinking became the endurance of a future which was not at one's disposal, Heidegger held that the whole idea of logic was dissolved in the swirl of a more primordial questioning.²⁰ But Heidegger is concerned precisely with giving that thought which springs from the event of appropriation a 'logical' and not simply a rhapsodic form. For this reason he seeks, by means of a reflection upon the fundamental principles of logic, to go back to the ground of traditional logic and thus discover the *logos* of his own thinking. Naturally it goes without saying that through this return to the 'ground' of metaphysics, traditional logic and contemporary logic just as little lose their rights, within their own limits, as do the demonstrations of unchanging essences. The rather uncautious polemic which prevails today between 'hermeneutical' philosophy and logical positivism serves only to obliterate the fact that a fruitful dialogue between those who are attempting to construct a 'hermeneutical' logic (Lipps) and the representatives of logical positivism is more than possible.

True, in his own thinking, Heidegger never made the possible positive meanings of 'idea' or 'logic' thematic, at least in the classical sense of these words. His thinking complies only with the free-floating structure of a whole, the moment we eliminate those one-sided formulations and directions of questioning which grew out of the attempts at a breakthrough and out of those polemical arguments which, to be sure, are occasionally necessary. Thus, one might pose the question, whether or not the experience of a continuously present idea as well as logic, and connected with it the whole of classical metaphysics, are to be considered

a derivative or even degenerate mode of thought, or if they should not rather be considered a mode of thinking that, within certain limits, does in fact do justice to primordial phenomena.

If the answer to this question is to be other than a merely traditional or positivist-pragmatic presupposition, it must be arrived at through a thinking which enters into dialogue with that which metaphysics has left unthought. Only such a debate over Being preserves the possibility of reappropriating that which metaphysics has in fact thought. Heidegger himself does not think that which metaphysics has left unthought exclusively in terms of the event of appropriation, but also attempts, by means of his ontological-historical reflections, to raise anew the question concerning those particular articulations of the meaning of Being which dominated certain phases of metaphysics, even though they were not explicitly thought through in themselves. The understanding of Being as *Idea*, *energeia*, objectivity, will to power, etc., must be thought through on the basis of what was not thought in it, i.e., time as the horizon of the understanding of Being. In this manner, thought, as it has been understood up until now, is to be placed back onto its own ground.

Heidegger, however, does not think that which metaphysics left unthought by placing himself at the 'end' of history and making the law of a self-contained system into the law of history, and thus superseding history (Hegel). Much more, Heidegger's thinking places itself into history in the full knowledge that it itself is finite and historical. The reflection which brings to completion the step backwards into that which has always at any given time been left unthought does not itself arrive at a final end or absolute completion.

Heidegger thinks his single thought, in that he goes back to what metaphysics left unthought, and thus frees himself for a thought yet to come. His thinking is a *way of thinking* and not simply a way which Heidegger brings to completion, but rather a way by means of which metaphysics goes beyond itself. The necessity of Heidegger's thought grows out of the fact that it must bring into language that which thought, up to now, has left unthought. This thought gains its binding character in that it is concerned with the whole of the Western tradition, which determines us all. The dialogue with Heidegger must gain its rigor from this binding character, from the relationship to the Same.

Way and method: hermeneutic phenomenology in thinking the history of being

Friedrich-Wilhelm von Herrmann

To Hans-Georg Gadamer
on his 90th birthday

In his first elaboration of the question of being in terms of fundamental ontology Heidegger characterizes the method of this ontology (in Section 7 of *Being and Time*) as both 'phenomenology' and 'hermeneutic phenomenology'.¹ However, not only do the terms *phenomenology* and *hermeneutics* disappear from *Beiträge zur Philosophie (Vom Ereignis)*² – where he takes the second way, i.e., elaborates the question of being according to the history of being – but there is also no mention of a 'method' that thinking in terms of the history of being might have. And yet, those who pay attention, not only to the external use of such terms, but also to what is most fitting in phenomenological seeing and the self-showing of the *Sache* (*Sichzeigenlassen der Sache*) know that thinking in terms of the history of being is *also* phenomenological through and through – that is, is guided by the self-showing of the *Sache* for thinking.

But the question still remains: why does Heidegger retain the principle of phenomenology while he abandons the terms *phenomenology* and *hermeneutics*? In the 'Dialogue on language'³ he responds to this question: 'This happened, not – as is often thought – in order to deny the importance of phenomenology, but rather to let my own pathway of thinking remain in the realm of the nameless' (GA 12, p. 114). At the end of Heidegger's 'My way into phenomenology' there is a still more articulate confirmation that thinking in terms of the history of being remains bound to what is most fittingly phenomenological:

Phenomenology . . . is the possibility of thinking, at times changing and only thus persisting, to correspond to the claim of what is to be thought. If phenomenology is thus experienced and kept hold of, it

can disappear as title, in favour of the *Sache* of thinking, whose disclosure remains a mystery.⁴

This says everything that is decisive regarding the point that we are making. Elucidations of the preliminary conception of phenomenology in *Being and Time* already conclude with this remark: 'The only way to understand phenomenology is to grasp it as possibility' (GA 2, p. 52). For Heidegger the phenomenological way of dealing with 'things themselves' lies in its *enabling character of possibility*. As possibility, phenomenology is higher than its actuality in any given case, because as possibility phenomenology can always be grasped anew and more originally.

Because phenomenology, as the method of self-showing of the *Sache* of thinking, is essentially at the service of this *Sache*, therefore phenomenology as the possibility of thinking transforms itself *along with the transformation of the Sache which shows itself*. If Husserl sees the *Sache* itself as intentional consciousness and transcendental subjectivity, Heidegger sees the *Sache* in a transformed way, as being what gets disclosed in Dasein's understanding of being. But with this transformation in the *Sache* there is also a transformation in the very meaning of phenomenology: as possibility, now understood in a new way. And when the *Sache* is again transformed within Heidegger's thinking of being – such that being as such is no longer thought within the transcendental-horizonal perspective, but as the unity of the relation of the truth of being to Dasein and of Dasein's essential relation to the truth of being – then this transformation yields a new and transformed understanding of phenomenology. And yet, throughout this manifold transformation, phenomenology *remains thinking's possibility*.

At this point phenomenology is characterized as that possibility which 'corresponds' (*entspricht*) to the 'claim' (*Anspruch*) of what is to be thought. By characterizing phenomenology as that possibility of thinking which makes possible this 'corresponding with the claim of what is to be thought', Heidegger clarifies phenomenology precisely as the enactment of thinking in terms of the history of being. For both of these words, *claim* and *correspondence*, are the root-words by which the unity of the *relation* (*Bezug*) of being to Dasein as well as Dasein's *comporting relationship* (*Verhältnis*) to being is grasped conceptually and in language within thinking in terms of the history of being. The unity of this relation and this comporting relationship is what thinking in terms of the history of being thinks as *the unfolding of being itself* (*Wesung des Seins selbst*), as *Ereignis*. In its way of enactment, thinking which thinks being's root unfolding as *Ereignis* is phenomenology. Thinking being in terms of the history of being thus becomes such a pure enactment of phenomenological self-showing of the *Sache* itself that the title 'phenomenology' can fall away.

As we stressed at the beginning, Heidegger calls phenomenology as the possibility of thinking being: *hermeneutics*. In the afore-mentioned 'Dialogue on language' Heidegger declares emphatically that, in the transformation from the transcendental-horizonal perspective to the perspective of thinking in terms of the history of being, phenomenology retains its basic hermeneutical character. There he speaks of the 'hermeneutical relation' and elucidates it as the bringing of a manifestation *in* the hearing of the message as the unconcealing of the twofold of emergent emergence (*Anwesen und Anwesendes*). This wording of the basic hermeneutical feature of phenomenology in terms of the history of being comes out of that context wherein claim and correspondence belong together, i.e., comes out of *Ereignis*. Thus there is no doubt that, in its enactment, thinking in terms of the history of being is determined phenomenologically and hermeneutically. Our *task*, then, is to work out the hermeneutical-phenomenological structure in the thinking in terms of the history of being.

It is true that, as it understands itself, thinking in terms of the history of being no longer talks about *method*. Instead it replaces methodological considerations with reflections on the *way* or *pathway* of thinking. In thinking in terms of the history of being, the words *way* or *path of thinking* are not used as metaphors. If we recall that *way* or *óðós* is the root-word in the word *method* – a coming together of the Greek words *μετά* and *óðós* – then we are called to understand, in this reflection of 'way', the transformed shape of hermeneutic phenomenology. In thinking in terms of the history of being, the word *way* is the root-word for the 'problem of method' as it fits the thinking of being. But because what is said with the word *way* in the thinking of being cannot be compared with modern thinking on method – either in philosophy or science – and because 'way' here is the direct opposite of 'method' in the modern sense, Heidegger no longer uses the word *method* in his reflections on the way. Rather he employs this term only in the sense of its modern usage. Hence his reflections on the question of the 'way' immediately mark this 'way' off as distinct from the modern understanding of method. Thus the title 'Way and method' indicates the pathway of thinking of being in its difference from the method of modern thinking and representation. With this differentiation the word *way* constitutes the basic hermeneutical-phenomenological feature of thinking in terms of the history of being.

Our task, again, is to work out the hermeneutical-phenomenological structure of thinking in terms of the history of being. But before we can do this, we must bring to mind explicitly how hermeneutic phenomenology functions as the method of dealing with the question of being in terms of fundamental ontology.

1 Hermeneutic phenomenology within fundamental ontology

(a) *The three senses of hermeneutics*

By interpreting the two root-words of Greek thinking that make up the term *phenomenology*, Heidegger defines phenomenology as 'letting what shows itself be seen from itself, just as it shows itself from itself' (GA 2, p. 46). Phenomenology is the manner of dealing with, the mode of access to and the manner of determining the theme of fundamental ontology. The theme of fundamental ontology, however, is Dasein in its *Existenz*, i.e., understanding being. In the enactment of its *Existenz* Dasein understands, along with its own being, the manifold being of beings that are not Dasein as well as the meaning of being in general. Understanding being through existing, discloses being as a whole, existentially-horizontally, or transcendently. Therefore the task of phenomenology as a method is step by step to let Dasein – in its *Existenz*, i.e., understanding being – be seen as what shows itself of itself from itself, such that Dasein's understanding of being shows itself as the transcendental-horizonal disclosure of being as a whole.

The *logos* of phenomenology, we are told, has the methodological character of ἐρμηνεύειν (GA 2, p. 50). Phenomenological description in the sense of showing and demonstrating what is to be seen from itself has the 'methodological sense' of interpretation (*Auslegung*). With this characterization of the methodological sense of phenomenology as interpretation or ἐρμηνεύειν, Heidegger distinguishes *his* notion of phenomenology from that of Husserl, who defines phenomenological description as *reflection* – a reflection which takes place in reflective acts as intentional acts of consciousness of a higher level.⁵ Thus interpretation is distinct from reflection.

But this distinguishing characterization is not sufficient, because phenomenological analysis which proceeds reflectively can understand itself as interpretive, too – interpretation of the intentional act of consciousness as the intentional object of the reflective act. The distinction between interpretation and reflection will be adequately made only when interpretation is no longer determined as an intentional act of consciousness, but rather from out of the mode of being of Dasein, i.e., from *Existenz*.

As theoretically explicit enactment, phenomenological interpretation is rooted in the *existential mode of being of interpretation*, as discussed in Section 32 of *Being and Time*. And interpretation understood existentially is essentially the unfolding and laying out of what is projected in advance in a *projecting understanding*. It is because Heidegger considers philosophical questioning itself to be 'a possibility of the being of each existing Dasein' (GA 2, p. 18) that Dasein exists as thrown projection – in the *Existenz*-possibility of a questioning which is phenomenological

and fundamental-ontological (Dasein as thrown into its *Existenz*, i.e., understanding being) – and as interpreting what is thus projected. Section 63 of *Being and Time* characterizes the root character of ontological interpretation as projection and the unfolding of what is projected. The being which, in the pre-phenomenological enactment of *Existenz* according to the *Existenz*-possibilities of being-in-the-world, is implicitly projected as *Existenz* – and as the being of beings other than Dasein – this being is explicitly and thematically projected in the *phenomenological enactment of Existenz* and gets interpreted in terms of its structural content. In this sense the question of being is ‘the radicalizing of an essential tendency of being that belongs to Dasein, i.e., of the pre-ontological understanding of being’ (GA 2, p. 20).

Hermeneutical-phenomenological thinking is not reflection, but rather a *projecting-interpreting understanding*. Because hermeneutic phenomenology as the method of fundamental ontology thematizes Dasein (in terms of its being, i.e., understanding being) by projecting and interpreting, phenomenology is the hermeneutical phenomenology of Dasein. Through ἐρμηνεύειν as a projecting-interpreting seeing of what shows itself of itself, ‘the proper meaning of being and the basic structures of Dasein’s own being are *made manifest* to the understanding of being that belongs to Dasein’ (GA 2, p. 50). Thus Heidegger elucidates interpreting by going back to the Greek sense of the word ἐρμηνεύειν which as interpreting also means proclaiming and making manifest. *Phenomenological interpreting as making manifest* is what Dasein itself accomplishes. In the phenomenology of Dasein and out of an understanding of being which is always already unthematically in enactment in and through the ἐρμηνεύειν which Dasein explicitly enacts, Dasein makes manifest to itself the basic structures of its own being (which are concealed in its unthematic understanding of being), the mode of being of beings other than Dasein, and the meaning of being in general. Dasein’s making manifest to itself takes place as interpreting unfolding of the projecting understanding of being which has been explicitly thematized. Because the phenomenology of Dasein has the character of ἐρμηνεύειν in the sense elucidated, this phenomenology is characterized as *hermeneutics*. This is the first sense of the word *hermeneutics*.

The second sense of hermeneutics follows from the first. In the existential root-structures of Dasein, which simultaneously constitute the understanding as *understanding of being*, the being of beings other than Dasein, the manifold modes of beings, and the manifold of what beings are are all horizontally disclosed. But along with temporalization of the temporality of Dasein, the temporalized horizontal time, i.e., *Temporalität*, is disclosed as the unity of the meaning of being of all beings other than Dasein. By phenomenologically uncovering the root-structures of Dasein and of the meaning of being that is understood by means of these

structures, the horizon of investigation for an ontology of beings other than Dasein opens up. Considering ontologies of beings other than Dasein, hermeneutics of Dasein as understanding being (hermeneutics in the first sense) becomes hermeneutics in the second sense, i.e., in the sense 'that it works out the conditions for the possibility of every ontological investigation' (GA 2, p. 50). It is in view of this task that the words hermeneutics of Dasein appear without quotation marks. But when they appear with quotation marks – 'hermeneutics of Dasein' – this indicates that hermeneutics which serves regional ontology.

The third sense of hermeneutics is also included in the first. The meaning of being as such can be phenomenologically interpreted and laid open only after Dasein is interpreted with regard to its *Existenz*, wherein Dasein implicitly understands the meaning of being. Considering the priority of this task within fundamental ontology, hermeneutics gets its third sense as 'the analytic of the existentiality of *Existenz*' (GA 2, p. 50).

As far as the sequence of steps is concerned, this third sense of hermeneutics is the 'primary' one, because only by taking this step can hermeneutical-phenomenological fundamental ontology come to an answer to the basic question concerning the meaning of being.

(b) *Conditions for the enactment of hermeneutics*

Phenomenological hermeneutics *is* interpretation in a certain sense. However, it is called *hermeneutics* because it is not interpretation in its pre-theoretical mode of being nor the theoretical way of comportment known as interpretation of texts, nor 'the methodology of historical humanistic disciplines' (GA 2, p. 51). This phenomenological hermeneutics interprets Dasein in its being as a projective and interpretive understanding. It is this phenomenology which shows first and foremost that, in its being, Dasein is constituted by projection and interpretation. The phenomenological-hermeneutical insight into the ontological constitution of Dasein also includes an insight into the mode of enactment of any phenomenological interpretation of one's own Dasein, namely that what enables this phenomenology is precisely what it brings forth, i.e., projection and interpretation, as they belong to the ontological constitution of Dasein.

The *mode of being* of the hermeneutic phenomenology of Dasein and its understanding of being is *explicit projection* and *explicit interpretation* of what is projected. There is no interpretation without projection and no projection without interpretation. Thus at the beginning of Section 32 of *Being and Time* we read: 'The projection of understanding carries within itself the possibility of self-unfolding. We shall call the unfolding of understanding: *interpretation*' (GA 2, p. 197). Moreover we read: 'Existentially, interpretation is based in understanding, not the other way

around' (ibid.). Interpretation does not shape the understanding; rather, as appropriation, interpretation emerges from that primary understanding which takes shape in projection. For this reason hermeneutics of Dasein is a projective-interpretive understanding of Dasein and its understanding of being.

However, projection is what it is as projection only in conjunction with the existential mode of being of *thrownness*. Projection can only disclose projectively what it is thrown into. For the hermeneutics of Dasein this means that explicit projection projects Dasein unto its *Existenz*, i.e., understanding being – an *Existenz* given in advance to projection by thrownness, as what is explicitly projectable.

Moreover, co-original with thrownness and projection is *Rede*,⁶ the root unfolding of language. Both of these basic existentials 'are co-originally determined by *Rede*' (GA 2, p. 177). For the hermeneutics of Dasein this means that when thrown projection is explicitly enacted – when Dasein is projected unto its *Existenz*, i.e., understanding being – this projection holds what is projected in an articulated understandability that stems from *Rede*.

If interpretation is existentially based in the projective understanding and if this understanding is what it is in conjunction with thrownness and articulated *Rede*, then the *totality* of explicit projection, thrownness and articulated *Rede* is where the phenomenological interpretation of hermeneutics is based.

Only when we see these subtle interconnections clearly do we grasp the extent to which interpretation is subject to the three conditions of enactment, namely fore-having, fore-sight and fore-grasping. We might say: what is projected in the explicit projection – or: what is projected in the *hermeneutic enactment of the thrown and articulated projection* – is what is primarily understood as *fore-having*. As appropriation of understanding, phenomenological interpretation moves within a being that understands Dasein, which is projected unto its *Existenz*, i.e., understanding being. It is this Dasein that has become fore-having for interpretation. Interpretive disclosing carries out the appropriation of what is primarily understood (thought still in a hidden way) under the guidance of a regard for that unto which what is projected is to be interpreted. This 'regard' which guides interpretation in advance is the *fore-sight*. In accord with its ontological relationship to its fore-having, interpretation already reaches ahead into a graspability which it (interpretation) draws from fore-having and into which it (interpretation) brings what gets interpreted. The third condition of enactment of phenomenological interpretation is *fore-grasping*. Because phenomenological interpretation is based within the totality of thrownness, projection and *Rede*, the conditions for the enactment of this phenomenology are fore-having, fore-

sight and fore-grasping. Thrownness is carried out in fore-having; projection, in fore-sight; and *Rede*, in fore-grasping (cf. *GA* 2, p. 200).

(c) *The circle of hermeneutics*

Fore-having, fore-sight and fore-grasping are the conditions for enacting any interpretation and thus also for enacting the phenomenological interpretation of hermeneutics. All interpretation – including hermeneutic interpretation – moves within this threefold structure. This structure implies that, when something is phenomenologically interpreted by hermeneutics, hermeneutics must have understood this something in advance – in an understanding which takes shape in a primary projection. With fore-having, fore-sight and fore-grasping as conditions for enactment, interpretation dwells in a *fore-understanding* of what interpretation is to interpret and make its own. For this reason no interpretation – and thus also no phenomenological hermeneutic – is ‘a pre-suppositionless grasping of something given in advance’ (ibid.). Interpretation of hermeneutics, too, operates essentially within a fore-understanding which takes shape and unfolds in the *hermeneutic projection* of Dasein, which projects Dasein unto its *Existenz*, i.e., understanding being. In so far as interpretive understanding nourishes itself from the projectible fore-understanding, in a certain sense it moves in a circle, though not an empty one. Rather, this circle deepens and differentiates understanding. This circle of understanding, the *circle of hermeneutics*, ‘is the expression of the existential fore-structure’ (*GA* 2, p. 203).

Because the circle of hermeneutics is the essential structure for interpretive understanding, this understanding requires that we ‘enter’ this circle ‘in the proper way’ (ibid.). Interpretation of hermeneutics must have understood

that its first, constant, and final task is not to let fore-having, fore-sight and fore-grasping be given by flashes of inspiration and popular conceptions, but to solidify the scientific thematic by working out these fore-structures in terms of the things themselves.

(ibid.)

This is a characterization of the enactment of interpretation in view of its basic *phenomenological* feature and its three conditions for enactment. Interpretation must see to it that what is understood in fore-having, fore-sight and fore-grasping is obtained from the things themselves, i.e., from what shows itself by itself. Only when projection projects Dasein in its existing understanding of beings – as Dasein shows itself by and from itself – can the interpretation of what is thus phenomenologically projected be in turn enacted phenomenologically.

As stated already, philosophizing Dasein *makes manifest* to itself the

basic structures of its own being, the mode of being of beings other than Dasein, and the meaning of being as such through ἐρμηνεύειν of the phenomenology of Dasein and out of its non-thematic understanding of being. For the sake of this hermeneutic proclamation (*hermeneutische Kundgabe*) philosophizing Dasein explicitly projects the existing understanding of being, which is otherwise enacted only implicitly. Hence we can call this project the 'hermeneutic project', which belongs essentially to the interpretation of hermeneutics.

2 The basic hermeneutical-phenomenological feature of thinking in terms of the history of being

(a) *The hermeneutic relation*

Heidegger's oft afore-mentioned 'Dialogue on language' is of extraordinary significance for our inquiry, because in that text with a few sharp strokes he marks out *the transformed structure of hermeneutic phenomenology in thinking in terms of the history of being*. In this dialogue we read that 'ἐρμηνεύειν is that revealing which brings tidings because it is capable of hearing for a message' (GA 12, p. 115). A little later we read: 'All of this makes it clear that hermeneutics does not mean just interpretation, but goes even deeper than that and means bringing of a message and tidings' (ibid.). What Heidegger then calls 'hermeneutic relation' is, as relation, the bringing of a message by way of listening to it. Bringing tidings is ἐρμηνεύειν, which takes place in hearing for a message. The message which is passed along to listeners is 'being itself', i.e., 'the emergence of the emergent, the twofold of the two out of their onefold' (GA 12, p. 116). We are told that it is this twofold that lays claim on 'humans in their root unfolding' (ibid.). And the root unfolding of humans consists 'in corresponding to the claim [*Zuspruch*] of the twofold' (ibid.). Humans correspond to this claim by listening to the message of the twofold, by proclaiming the message that they hear, and by bringing tidings of it.

This characterization of the hermeneutic relation articulates thinking in terms of the history of being – a thinking that thinks the relation (*Bezug*) of being to Dasein and the comports relationship (*Verhältnis*) of Dasein to being, thinking this whole relation as *Ereignis*.

But which *experience* of thinking is it that transforms the initial posing of the question of being in terms of fundamental ontology into the approach to this question in terms of the history of being? What is called 'claim' (*Anspruch*) and 'appeal' (*Zuspruch*, *Zusage*) in thinking in terms of the history of being has the same structure of relation as the 'throw of being' (*Wurf des Seins*) in the *Letter on Humanism*.⁷ It is the 'throw of being' that gives rise to the 'thrownness of Dasein'.⁸ Thus it is the

phenomenological experience of the *origin of thrownness in being's throw* ('throwing forth') of the truth of being that opens up the way for thinking the question of being in terms of the history of being.

However, we cannot enter the pathway that works out the question in terms of the history of being without having gone the way of elaborating that question in terms of fundamental ontology. The way-opening experience of existential thrownness as coming from the throw of the truth of being is, finally, the decisive insight into being's root unfolding as *Ereignis*.

In this context there is a key passage from that work of Heidegger's which, by way of a sixfold, conjoined lay-out, opens out the elaboration of the question of being in terms of the history of being, namely *Beiträge zur Philosophie (Vom Ereignis)*. This key passage states that:

the thrower of projection experiences itself as thrown, as appropriated by being. The opening which is achieved through projection is an opening only when it occurs as the experience of thrownness and thus as a belonging to being. This is the essential difference *vis-à-vis* all *transcendental* ways of knowing with regard to the conditions of possibility.

(GA 65, p. 239)

One cannot fail to hear here that thrownness of projection is the same as its *being-appropriated* through being for the sake of the root unfolding of the truth of being. *Appropriating* means that humans are determined as 'proper to being' (GA 65, p. 263) in terms of being's relation to them. The thrown projection which occurs in terms of appropriating takes place in such a way that it picks up the 'counter-movement of appropriating' (GA 65, p. 239). But depending on how projection picks up this 'counter-movement', the *free* character of projection comes into play.

Already in *Beiträge* Heidegger sees the relation of appropriating (being-thrown) as *needing* (*Brauchen*) and the projective relationship to the appropriating truth of being as the *belonging* (*Zugehören*) of humans to being's root unfolding: 'In order to unfold, being needs humans. And humans belong to being so that they accomplish their uttermost calling as Da-sein' (GA 65, p. 251). The onefold of appropriative needing and projective belonging makes up the 'innermost occurrence' in *Ereignis*. It is this innermost occurrence, the *unfolding of being as Ereignis*, that Heidegger calls 'the turning in *Ereignis*' (GA 65, p. 407). In one of the most precise formulations Heidegger says: 'The turning unfolds between the call (to the one who belongs) and hearing the call (by the one who is being called). The turning is a re-turning' (ibid.). Thus *Beiträge* thinks the *basic structure of thinking in terms of the history of being*, which

from now on undergirds, guides and governs all of Heidegger's writings, including what is properly called his 'later philosophy'.

When thinking thinks being as such in its unfolding as *Ereignis* and as the returning in *Ereignis*, then this thinking gets accomplished as a listening which hears for the appropriating call of being, i.e., hears for the message, and as a manifesting of what is heard. In hearing-for, thinking receives the truth of being as what throws itself forth. Thinking experiences its *throwness* in this receiving. By bringing tidings of what it receives, thinking comports itself *projectively* towards and preserves the truth of being which throws itself forth (cf. *GA* 12, p. 119). In the language of thinking and in the word of the work of thinking, thinking preserves/shelters being's root unfolding as *Ereignis* and the turning in *Ereignis* – whose root unfolding is thrown forth and projected. In hearing for the call, thinking comports itself phenomenologically-hermeneutically: *phenomenologically*, in so far as thinking lets the self-showing of things themselves or being as such be seen; *hermeneutically*, in so far as in projection thinking brings tidings of the self-showing and, in preserving/sheltering, interprets what throws itself forth and is projected, bringing it into the articulated word of the work of thinking.

The transformation of hermeneutic phenomenology in the thinking in terms of the history of being follows from thinking the root unfolding of being as *Ereignis*. In hearing-for a message, hermeneutic bringing of tidings shows in itself the structure of *Ereignis* as an occurrence. When Heidegger says that humans stand within the twofold through the *hermeneutic relation*, the term *Bezug* (relation) does not mean *Beziehung* (connection). Rather it means *Brauch* (need) in the sense that we discussed above: human being in the root unfolding as *Ek-sistenz* is needed by the truth of being and for this truth, so that humans belong to 'a need which claims them' (*GA* 12, p. 118).

The hermeneutic relation in which humans stand takes place when the appropriating-needing relation to the truth of being and the appropriated relation belonging to the truth of being come together. This becomes clear when Heidegger says that the relation in which humans stand, in accordance with their root unfolding, is called 'hermeneutical, because it brings tidings of that message' (*GA* 12, p. 128). This message 'claims humans in order that they correspond to it' (*ibid.*). In the word *message* we must think solely the truth of being which in its throw to humans discloses them as *Dasein* and throws them into *Dasein*, such that they exist as thrown. Similarly we must think the bringing of tidings by the message solely as claimed, i.e., as a thrown projection which corresponds to the appropriating throw of the truth of being. Correspondence is the mode of enactment of projection. Thus the word *message* is the fundamental word in hermeneutics for the *throw*, i.e., for the 'bringing of the tidings'. This word is also the fundamental word in hermeneutics for the

projection as projected from within the throw of the truth of being. In so far as in their projective thinking humans bring tidings of the message that they have heard, they are 'messengers of the message' (ibid.). Bringing tidings of the message is also 'a course/pathway taken by the message' (ibid., p. 148).

Within the fundamental-ontological perspective, phenomenological hermeneutic is characterized as an ἐρμηνεύειν which, as the explicit, projective interpreting that lets-be-seen-from-itself, makes the fundamental structures of Dasein's ownmost being and the meaning of being as such manifest to the understanding of being that belongs to Dasein. What is disclosed through hermeneutical (philosophical) projection is given in advance (by thrownness) as projectible and interpretable. What is given in advance to this projection is Dasein as it exists implicitly in its understanding of being – Dasein which as such is projected hermeneutically onto its existential structures and onto the meaning of being as such, disclosed existentially and horizonally.

If we now turn to the experience marked by the history of being, according to which Dasein's *thrownness* into the disclosure of being as a whole stems from the *throw* of the disclosure of the truth of being, then what is projectible by hermeneutic projection is no longer solely given in advance in thrownness, but comes from out of the throw of the truth of being. But then ἐρμηνεύειν no longer means *making* manifest, but rather *bringing* tidings of what throws itself forth.

But why did the thrownness which was phenomenologically-hermeneutically laid out in the transcendental-horizonal perspective prove inadequate for the thinking that determines being as such? Because the transcendental-horizonal perspective could not let the *historicality of being itself and its truth* be thought. To be sure, the fundamental ontology of *Being and Time* thinks through the historicality of Dasein, its existing in the possibilities of being-in-the-world, comprehended either as appropriate or inappropriate. But what is left unthought in this ontology is the historicality of the disclosure of being as a whole. And it becomes necessary for Heidegger to think the historicality of being itself when he undergoes the phenomenological experience that *the WAY that beings emerge gets historically transformed*. We can think the mode of emergence of beings as standing reserve (*Bestand*) in the root unfolding of technique only when we phenomenologically-hermeneutically think the historicality of the truth of being as the *historically transformed unfolding of being*. We gain an insight into the historical unfolding of being itself when we experience and think thrownness into the disclosure of being from out of the appropriating throw of being.

(b) *The way of regioning*

Phenomenological-hermeneutic thinking, bringing tidings of the message heard in listening, takes place as a 'way' of thinking. The question now concerns this 'way' as a pathway and how this pathway relates to thinking and to what is to be thought. The elucidation of these questions takes place in a reflection on 'way'.

A decisive reflection on 'way' is found in the series of lectures entitled *Das Wesen der Sprache: The Root Unfolding of Language*⁹ (GA 12, p. 167). The question concerning the root unfolding of language occupies an eminent place in the elaboration of the question of being by thinking in terms of the history of being. In the 'Dialogue on language' we read in this regard: 'Language, accordingly, is the predominating and sustaining element in the relation of human beings to the twofold. It (language) determines the hermeneutic relation' (GA 12, p. 116). We mentioned at the beginning that reflection on the 'way' as a pathway of thinking being differs from method as it is understood in the modern sense. The fact of this differentiation already makes clear that, in dealing with the 'way', we are dealing with the incomparable 'question of method' as it pertains to the thinking of being. Because the word *method* gets its determination in terms of the modern understanding of method, the thinking of being renounces the word *method* when it reflects on 'way'. This is true, even though, when considered in its literal sense, the word *method* means 'along the way' and would be an appropriate word for the kind of going that occurs as thinking of being on a 'way'.¹⁰

How does Heidegger characterize the root unfolding of method in modern science? As a way of knowing, scientific method is not just an 'instrument at the service of science' (GA 12, p. 167). The modern conception of method does not have the character of serving, but of dominating. This character shows itself in the manner in which for its part method 'takes sciences into its service'. The relationship between *subject-matter* and *method* in the sciences indicates a priority of method over subject-matter. The domineering character of the scientific method reflects the domineering position of the subject in the modern sense, which in its representational and domineering relation to beings represents and produces them solely as objects, eventually reducing beings to an orderable standing reserve. Method controls subject-matter, i.e., the beings to be examined scientifically, in such a way that not only does method determine the subject-matter, but also 'places the subject-matter into the method', thus making subject-matter 'subordinate' to method (ibid.). Gathering up, Heidegger characterizes the relationship of method to subject-matter in modern science by saying: 'All power of knowing lies in the method. The subject-matter is taken up and absorbed by the method' (ibid.). The method prescribes *what* is to be considered a valid

object of knowing and *how* this object is to be known. Beings themselves do not provide the pattern for access to them. Rather, method forces beings to show themselves according to method's instructions. This domineering way in which modern method unfolds is an essential way for the modern subject to establish its reign over beings.

Considering how thinking being differs from scientific representation, we might expect to see in the thinking of being a simple reversal of the relationship of method to subject-matter. But this is not the case. Heidegger says: 'Here there is neither a method nor a subject-matter' (ibid.). This is to say that in the thinking of being there is neither a method nor a subject-matter as these terms are posited in scientific representation. That thinking of being has no subject-matter does not mean that this thinking is without a matter for thinking. That thinking of being has no method does not mean that this thinking is without a pathway. It simply means that the relation between matter for thinking and pathway of thinking in the thinking of being is a totally different relationship from that of subject-matter to method in the thinking of the sciences.

Instead of method and subject-matter, thinking of beings thinks 'way' and 'region'. Whereas in characterizing scientific thinking Heidegger puts method ahead of subject-matter, in characterizing the thinking of being he first mentions 'region' and then 'way'. Region is called a region 'because region regions and makes free what is to be thought by thinking' (GA 12, p. 168). As in all basic words from Heidegger's later thinking, the word *Gegend*/region, too, at first seems strange. But as in all basic words from Heidegger's later thinking, the word *Gegend*/region, too, is drawn from letting the matter show itself. When Heidegger says *Gegend gegenet* (region regions), he is reaching back to the Middle High German word *gegenen* – a word which is lost in the modern High German – which means *entgegenkommen* (coming over against) or *begegnen* (meeting). When *Gegend* takes place in the regioning of the region, what is to be thought comes over against thinking; it meets thinking. Regioning of the region frees up for thinking what is to be thought.

But 'regioning of the region' as 'coming over against' shows the same structure as the message that belongs to the *hermeneutic relation*, i.e., from the disclosing of the twofold of emergence and emergent that thinking takes up. The basic disclosing character of the regioning of the region is what Heidegger thinks as freeing or freeing up – from out of concealment into the open of unconcealment.

In the same way 'regioning of the region' shows the same structure as the call (*Zuruf*), appeal (*Zuspruch*) or claim (*Anspruch*). But this is nothing other than the 'throw' of being from which the thrownness of Dasein emerges into the truth of being. In that it regions, region frees up 'what is to be thought by thinking', i.e., the matter to be thought. In a broad and formal sense region and what it always frees up is the

'subject-matter' of thinking. But this subject-matter is not just posited by the 'method' which controls it; rather, it is freed up by a preliminary appeal for thinking as what is to be thought. What is freed up as the matter for thinking is what shows itself by itself; and this self-showing lets thinking hear the call, the message. Because what is to be thought is freed up by the regioning of the region, therefore thinking comports itself to it as the self-showing of the matter itself, as a *phenomenological* thinking.

This way of thinking, which receives what is its to think from the freeing up that occurs in the region, 'dwells in the region by going the ways of the region' (ibid.). To the extent that thinking grasps what is in each case freed up, it *becomes* a way for thinking. The genitive 'ways of the region' is a *genitivus possessivus*. These are ways which belong to the region in as much as this region frees them up. When thinking hears, understands and unfolds what is freed up as what meets thinking, then thinking sets upon a way that gets shown from the region. In the thinking of being, 'the way belongs in the region' (ibid.).

It is important to note this determination of the relationship between way and region, in order to distinguish *this* relationship from the relation of method and subject-matter in modern thinking and representation. Whereas in modern thinking subject-matter belongs to method, in the thinking of being way always belongs to the region. In scientific representation subject-matter submits to the method which controls it. By contrast, in the thinking of being the way is joined to the region, because it is the region which, in its freeing up the being which it must think, lays out the way to be gone. For such a thinking the 'method', now thought as 'way', gets its determination from within the matter to be thought, in so far as this matter opens access to itself in a preliminary way.

What in 1959, in the lecture trilogy *Das Wesen der Sprache*, Heidegger thought in the phrase 'ways of the region' he had first worked out in *Beiträge zur Philosophie*, his second major work, after *Being and Time*. In *Beiträge* he worked out the phenomenological-hermeneutic thinking of *Ereignis* in terms of the history of being. *Beiträge* refers to thinking in terms of the history of being as '*Gedanken-gang*': 'a pathway of thought which runs through and lights up the hitherto concealed realm of being's unfolding and obtains this realm in its ownmost character as *Ereignis*' (GA 65, p. 3). The 'work of thinking' which occurs as thinking in terms of the history of being can and must be 'a *pathway*, with all the ambiguities of that word: a going and at the same time a way – thus a way which goes itself' (GA 65, p. 83). And this way is the way of access to being as *Ereignis*. Of course, being the way it is, this way is freed up by the appropriating throw of the truth of being; and only as 'always freed up in appropriated projection can it be grasped and gone.

For this reason the way of thinking's projection 'does not have the firm contours of a map' (GA 65, p. 86). Instead the land/region *emerges* only *through the way*, granted that this way 'is determined by being itself', i.e., is freed up in the appropriating throw as a projectible and goable way (GA 65, p. 80).

In making this sharp distinction between way and method, Heidegger is not engaging in self-criticism regarding his initial account of the 'phenomenological method'. From the outset Heidegger's understanding of method in the 'letting what shows itself by itself be seen from itself' is contrary to the modern understanding of method. The phenomenological method that is worked out in Section 7 of *Being and Time*, as a method of letting what shows itself be seen from itself, is precisely *not* the same as a method which controls the subject-matter of scientific knowing. Rather it is a method which is joined to the philosophical subject-matter, namely the meaning of being as such and the ontological make-up of Dasein, i.e., understanding being. As far as the phenomenological method of *Being and Time* is concerned, the matter for thinking has the first and last word. As self-showing of the matter itself, phenomenological method is completely and diametrically opposed to the modern understanding of method. The modern understanding of method is as far removed as is possible from the basic phenomenological attitude. This understanding of phenomenological method, which Heidegger also calls the *formal* concept of phenomenology, was instituted by Husserl and summed up in the maxim 'to the things themselves'. Heidegger's thinking from beginning to end lives off this understanding of phenomenology – an understanding which the later Heidegger formulated simply as 'letting the matter show itself'. For this reason the only proper way of access to Heidegger's thinking is the way of *phenomenological* interpretation.

(c) *The turning in Ereignis and the circle of hermeneutics*

As it is outlined for the first time in *Being and Time*, phenomenological hermeneutic includes in essence a fore-understanding, given in fore-having, fore-sight and fore-grasping, and – along with this fore-understanding – the circle-structure of hermeneutics. How do both fore-understanding and the hermeneutic circle-structure fit in the *hermeneutic relation* of thinking in terms of the history of being?

We find instructive responses to these questions again in the 'Dialogue on language'. As Heidegger specifically points out, what is discussed in this dialogue – particularly with regard to the question of language's root unfolding – is significant for *all* the issues of thinking in terms of the history of being. In that dialogue Heidegger characterizes the question concerning the root unfolding of language, as well as the question concerning being as such, as putting a question to (*Anfrage-bei*) and asking after (*Nachfrage-nach*). In the question of being we put a question to

being and ask after being itself, i.e., being's root unfolding. In order to initiate this questioning and inquiry, we must open ourselves to a 'regard' or 'sight' which, as Heidegger emphasizes, is not limited to the questions just touched upon (GA 12, p. 164). That to which we put the question and ask after 'must already have been addressed to us' (ibid.). The structure of having already been addressed by what is to be taken into the question is the structure of the necessary fore-understanding within which every question originates.

This regard which must open up questioning as putting-the-question-to and asking-after, in order to see through its own conditions of enactment – this regard we can call the *hermeneutic regard*. Heidegger formulates this in a general way when he says:

Putting the question to something [*Anfrage*] and asking after something [*Nachfrage*] need here and everywhere first to be addressed by that which touches them in questioning and which they pursue in questioning. The starting point of any question always already dwells within the appeal of that to which the question is put.

(ibid.)

In the realm of thinking in terms of the history of being every question receives its essential and necessary fore-understanding from the appeal or that which first of all enables questioning as such. As a putting the question to something or asking after something, questioning would run into a vacuum, were it not guided in advance by what questioning asks about and searches for (cf. *Being and Time*, Section 2). The question of being as such has its fore-having in the appeal of that to which the question is put and which is asked after. As a questioning, this question looks to this *fore-having*, within a *fore-sight* and a *fore-grasping*. This questioning that always already dwells within the appeal is the structure of the *hermeneutic circle*.

If questioning in the realm of thinking in terms of the history of being is so decisively made possible from out of the appeal, then questioning is not 'the genuine gesture of thinking . . . but rather hearing the appeal of what must come into question' (ibid.). Such an *essential hermeneutic insight* into the basic posture of thinking in terms of the history of being does not abolish questioning as questioning, in favour of a mere listening. This by no means denies the questioning character of thinking in terms of the history of being. It is simply and solely a matter of detecting the condition for initiating and enacting the question. If it turns out that the starting point for the question has the appeal of fore-having as its condition, then *mere questioning* can no longer be the basic posture of thinking, but rather an understanding that hears what is offered for questioning and asked after. Only if thinking above all is an understand-

ing hearing of that which lights up as what is to be thought and questioned – only then can thinking begin its questioning in the right manner (as putting a question to something and asking after it) and enact it step by step. In the enactment of questioning, thinking is primarily an understanding hearing of that which thinking inquires into.

The thinking which thus makes its basic posture transparent to itself is not at all a thinking without questioning, but attempts to gain clarity about that which *makes possible this thinking's ability to question*.

Thinking of being which receives its fore-having for its enactment from a hearing understanding of what is offered to it has the character of a *self-joining*. This thinking does not exercise control *over* the matter that this thinking has to think. Rather, this thinking is joined to the matter for thinking which is thrown toward thinking as something to be thought. The basic *phenomenological* attitude of this thinking speaks from out of that joining, in which the matter to be thought shows itself for this thinking's enactment of questioning. But the basic phenomenological attitude of this thinking is at the same time its basic *hermeneutic* character. Hearing understanding of the appeal of that 'to which all questioning is put by asking after the root unfolding' (ibid.) is the same hearing that we are familiar with in the 'hermeneutic relation' as that hearing of the message which brings tidings of it.

Thinking in terms of the history of being accounts for the essential hermeneutic insight into the hearing understanding of the appeal of that which is put into question when, as is the case in questioning the root unfolding of language, this thinking formulates the following directive for the continuation of its questioning thinking: root unfolding of language: language of root unfolding. The expression which follows the latter colon is the formal indicator of the *fore-understanding* of what is asked after. Thus thinking in terms of the history of being is also held within that peculiar movement which *Being and Time* calls the *circle of understanding*.

There is an instructive passage in *Beiträge zur Philosophie* in which – as is to be expected from everything that we have said so far – the *circle of hermeneutics is transformed and re-rooted into the 'turning in Ereignis'*. This passage reads:

The innermost occurrence in *Ereignis* and its widest reach lies in the turning. The turning that unfolds in *Ereignis* is the hidden ground for all other turnings and circles – each one subordinated, unclear in its origin, remaining unquestioned, and wanting to be taken as the 'very last' turn or circle. (Cf. the turn in the contexture of the guiding question and the circle of understanding.)

As presented earlier, *the turning in Ereignis* is the appropriating relation of being to Dasein and the appropriated-projecting belonging of Dasein to the unfolding of the truth of being. The appropriating relation, or as Heidegger puts it in *Beiträge*, 'being's breakthrough [*Anfall*] as appropriating the *Da*' (ibid.) is that appeal which has always to be heard and understood before thinking can put a question to being or ask after it. Questioning as putting-a-question-to and as asking-after gets enacted according to the hearing understanding of the appeal as a thinking projection. Only what is projected in the hermeneutic project out of hearing the appeal can be interpreted in the narrower sense as a thrown-projection. The *circle of understanding* is rooted in the turning which unfolds in *Ereignis* as the counter-movement of the appropriating-throw and appropriated-projection.

Thinking in terms of the history of being which thinks the root unfolding of being (being as such) as *Ereignis* and as the turning in *Ereignis* – and which is understood in its character of enactment as appropriated from out of *Ereignis* – is a phenomenological and then a hermeneutic thinking. Not only does phenomenological hermeneutic or hermeneutic phenomenology think the root unfolding of being as *Ereignis*, but it also has its enabling ground in *Ereignis* and in the turning that belongs to *Ereignis*.

The interpretive glimpse into the basic phenomenological-hermeneutic feature of thinking in terms of the history of being leads to this insight: in its manifold ways Heidegger's thinking can be appropriately and adequately interpreted only if each stage of interpretation heeds the *basic hermeneutic-phenomenological* character of this thinking. We owe hermeneutic phenomenology as *phenomenology* to Edmund Husserl's original establishment of this basic philosophical posture. Only one who has thoroughly mastered Husserl's phenomenology in the sense of its actual maxim 'to the things themselves' and who has worked through this phenomenology by enacting it – only such a one is called upon and capable of entering into a philosophical dialogue with Heidegger's thinking, as caretaker of this phenomenological-hermeneutic thinking and of the two ways of elaborating the question of being.

Looking metaphysics in the face

Jean Greisch

So sind wir zum letzten Mal in all diesen umwegigen Versuchen einer Kennzeichnung der Metaphysik gescheitert. Haben wir dabei nichts gewonnen? Nein und ja. Gewonnen haben wir nicht eine Definition oder dergleichen. Gewonnen haben wir wohl eine wichtige und vielleicht wesentliche Einsicht in das Eigentümliche der Metaphysik: dass wir selbst ihr gegenüber ausweichen, uns von ihr selbst fortschleichen und uns auf Umwege begeben; dass aber keine Wahl bleibt, als uns selbst aufzumachen und der *Metaphysik ins Gesicht zu sehen*, um sie nicht wieder aus den Augen zu verlieren.¹

My title was suggested by the poster of a congress on 'Heidegger and metaphysics' carrying a sketch by Paul Klee of a human face whose principal feature was an enormous eye. The phrase 'looking metaphysics in the face' is not my own invention but comes from Heidegger himself, who uses it several times with marked emphasis in the introduction to *The Basic Concepts of Metaphysics*, a course given at Freiburg during the Winter semester 1929–30. It occurs in the text I have chosen as epigraph:

So for the last time in all these circuitous efforts at a characterization of metaphysics we have failed. Have we gained nothing in the process? No and yes. We have not gained a definition or anything of that sort. But we have gained an important and perhaps fundamental insight into what is proper to metaphysics: that we ourselves edge away from it, side-step it and embark on detours; but that no choice remains except for us to set forth anew and to *look metaphysics in the face*, never to lose sight of it again.

Metaphysics, if we take these statements seriously, would then be essen-

tially a matter of looking, a particular optical system. This was indeed the sense in which Heidegger envisaged it from the time of his Habilitation thesis, at the end of which we find the following statement: 'Philosophy cannot in the long run do without its proper optics, which is metaphysics.'²

1 An exposed reading of Heidegger

Later we will examine the context of our epigraph, clarifying in particular the reference to certain 'detours'. For the moment let us focus on a twofold question: What does it mean – for Heidegger and for us – to 'look metaphysics in the face'? Was Heidegger himself able to fulfil the aspiration expressed in that formula, or did he himself not progressively and increasingly lose sight of metaphysics? These are not random questions; they emerge from a concrete hermeneutical site, a precise moment in the history of the reception of Heidegger's problematic. Otherwise it would be arbitrary to single out from the vast stretch of thinking covered in the 1929–30 course a brief formula which might after all be no more than professorial rhetoric. What defines the site for the reading I present here is an *exposure* – in every sense of the word – to the powerful initiative of Emmanuel Lévinas in developing the theme of the face of the other, a theme which is both phenomenological and metaphysical. Read in this light, Heidegger's apparently harmless reference to 'the face' claims our attention as something that deserves to be thought about, and that should not be allowed to slip by unquestioned. It may be that a rigorous confrontation between the thought of Lévinas and that of Heidegger – doubtless the two most empathic thinkers of our time – is the royal road to grasping in terms accessible to contemporary thought the invitation which Heidegger at a given epoch in his thinking addressed to his hearers and his future readers: 'look metaphysics in the face'.

To make progress in this line of questioning, it is essential to respect on both sides the singularly complex *données* of the problematic, instead of confining ourselves to convenient clichés. In dealing with Heidegger there is a temptation to fall into the cliché that has been canonized during a whole phase in the reception of his thought, namely the hasty reduction of the relation between 'Heidegger and metaphysics' to a clear-cut and massive opposition – 'Heidegger *against* metaphysics'. Of course it cannot be denied that the latter slogan has a certain legitimacy; it is warranted by too many texts of his to allow it to be ignored. It is true that from a certain period – roughly from about 1936, the time of the famous turn (*Kehre*) in his thinking – Heidegger, after long study of Nietzsche, makes much of the exhaustion (*Verendung*) of metaphysics and postulates the necessity of another beginning for thought

(*andersanfängliches Denken*). However, the complexity of the terminology he chooses (*Verwindung-Überwindung*, relinquishment-overcoming) shows that 'to lose sight of metaphysics' is not a simple business. The process of overcoming is regularly described as nothing less than a conversion to another way of looking, or as exposure to the gaze of the *Ereignis* (appropriation), of which we had been hitherto unaware. This theme of the new way of looking is richly orchestrated in a major text, surely destined to play a decisive role in the future interpretation of the genesis of Heidegger's thought: the *Beiträge zur Philosophie* (*Contributions to Philosophy*) recently published in the *Gesamtausgabe* on the occasion of the centenary of the philosopher's birth.

The central theme of this new post-*Kehre* way of looking is expressed at the conclusion of the essay '*Überwindung der Metaphysik*', which is devoted to the problematic of the *Verwindung* of thought's previous way of looking:³ that which we must look in the face is the *Ereignis* which itself is looking at us.⁴ Precisely because we know that Heidegger thus turned his gaze in another direction than that of metaphysics, it is of great importance to us to be clear on what looking metaphysics in the face meant to him at an earlier phase of his itinerary. The concrete hermeneutical site of my inquiry is further defined by this conviction: that what is most needed for a lucid grasp of Heidegger's achievement today is not so much to reflect more deeply on the nature and difficulties of the Heideggerian *exit* from metaphysics as to grasp correctly the conditions of his *entrance* into metaphysics. Instead of confining ourselves exclusively to the question: how did Heidegger (or did he) succeed in *leaving* metaphysics, we should take up the more opportune and promising query: how, for what reasons, did Heidegger (or did he) succeed in *entering* into metaphysics? Or to put it more dramatically: it is by the gate of life rather than by the gate of death that we can best enter into the issue of Heidegger's relation to metaphysics.

2 From Husserl's eyes to the gaze of the *Ereignis*

The question thus formulated may occasion some surprise. For is it not obvious that in the first period of his thought Heidegger was a metaphysician? But just this is what is open to question, not only for the interpreters of Heidegger, but, in my opinion, first of all for Heidegger himself! Instead of immediately imputing to him a metaphysics, we must recognize the fact that at the beginning of his philosophical itinerary nothing was less evident for him than that he could install himself in metaphysics! The motives that prevented him from declaring himself a metaphysician are quite complex. The most obvious ones are of a polemical order, and they surface throughout the lecture courses of the period

preparatory to *Being and Time*. The term 'metaphysics' had become too inflated at that time not to inspire mistrust in one who was struggling for an intransigent intellectual probity. It is not surprising that Heidegger does not adopt the analyses of Peter Wüst who was noisily announcing the 'resurrection of metaphysics'. But this polemical antipathy cannot be separated from a more positive and for that reason more decisive philosophical motive. Since we have placed our reflections under the sign of the metaphor of looking, we cannot omit mention of the remarkable avowal of Heidegger in his 1923 course *Ontology: The Hermeneutics of Facticity*: 'My travelling companion in research was the young Luther and my model Aristotle, whom Luther detested. Kierkegaard gave me impulsions, and as for the eyes, it is Husserl who put them in my head.'⁵ If it is Husserl and he alone who gave Heidegger his eyes, it follows that it is with Husserl's eyes, in other words those of phenomenology, that one is supposed to look metaphysics in the face. Now for someone like Heidegger who estimates – sincerely, not hypocritically – that it is Husserlian phenomenology and it alone that furnishes the basis for a radical rehandling of the question of being, to define a metaphysical position could not be a matter of course. For a phenomenological ontology, metaphysics as an academic tradition has ceased to exist. Nor is it at all obvious that it can recover an existence outside academic tradition. Such a recovery demands that one reinvent the phenomenological signification of the term 'metaphysics'. (And here we come on the first basic reason necessitating a confrontation of the positions of Heidegger and Lévinas: both of them, though for dissimilar motives, tackle the same task of giving a phenomenological signification to the term 'metaphysics'.)

My reflections thus far imply a particular reading of the itinerary of Heidegger. I would propose the following perhaps over-schematic periodization:

(1) In a first period, corresponding to the phase of the elaboration of *Being and Time*, the question of metaphysics is posed for Heidegger only in a lateral way, that is, as a question whose primordial importance is sensed and which for that very reason has to be deferred. Other tasks take priority: that of developing a hermeneutics of facticity which would realize all that the philosophers of life had unsuccessfully promised to accomplish; that of an existential analytic permitting the constitution of a fundamental ontology. This first period may be seen as ending in 1927 with the course *The Basic Problems of Phenomenology* which is of capital importance for the explication of the ontological programme sketched in *Being and Time*, especially for the interpretation of the problematic of the ontological difference.

Nothing better indicates the problematic status of metaphysics in this

period than the ambiguity attaching to the status of the existential analytic. Should it be seen as a 'metaphysics of Dasein'? That is what is suggested by several expressions in *Kant and the Problem of Metaphysics*, where we read, for example, that 'Fundamental Ontology is the metaphysics of human Dasein which is required for metaphysics to be made possible'.⁶ Heidegger is indebted to Kant for the realization that before being a theoretic discipline metaphysics 'belongs to human nature', hence the task of clarifying in what exactly this natural disposition consists. This is the specific task of the existential analytic, which thus indeed is pursuing a 'metaphysical' goal. But nothing guarantees that it has already attained this goal. The problematic title, 'metaphysics of Dasein', indicates a task rather than the solution of a problem, and the perception of that task is inseparable from the admission that 'metaphysics is the title of a fundamental philosophical difficulty'.⁷ As we shall see, this dilemma or aporia is connected with the fact that behind the title 'metaphysics' is concealed a more fundamental and decisive problem, that of the status of *first philosophy* (*protê philosophia*).

We are thus obliged at least to put to ourselves the following question: does the existential analytic exhaust the totality of metaphysics or does it represent only a partial aspect, the prolegomena, of a much larger task? But we could go on to ask whether the very nature of the existential analytic does not forbid us to confuse it with metaphysics properly speaking. Warnings against this confusion permeate the reinterpretation of *Being and Time* which Heidegger proposed in 1928 in the course *The Metaphysical First Principles of Logic beginning from Leibniz*. The dominant theme of the twelve leading theses of which this self-interpretation is composed is the neutrality which characterizes the existential analytic and the fundamental ontology associated with it. As a mere *analytic*, Heidegger reminds us, the existential analytic necessarily involves a 'metaphysical neutrality' because in it 'the metaphysics of Dasein is not yet central'.⁸ In other words: let us not seek in *Being and Time* a *metaphysical* position of any kind, because so far there is no question of anything but a mere *analytic*, neutral in respect to every metaphysical engagement and demanding that all questioning of an ethical kind be left aside.⁹ One could also show – and it would not be irrelevant to the confrontation for which I am here preparing the ground – that in the same self-interpretation metaphysical neutrality and ethical neutrality (not to be confused with indifference!) support one another.¹⁰

One could seek a genetic explanation for this alternation between two viewpoints – the description of the analytic in terms of a 'metaphysics of Dasein' and the prohibition, in almost contemporary texts, against identifying the analytic with metaphysics. But this would, I feel, be a futile enterprise. The ambivalence of Heidegger's language must be taken

for what it is: the expression of an aporia which attests to the problematic status of metaphysics and the difficulty of 'looking it in the face'.

(2) The second period, opening at the end of the twenties and the beginning of the thirties, can be said without exaggeration to be devoted to really looking metaphysics in the face. To look metaphysics in the face now means first of all to undertake an enormous labour of reappropriation of the founding texts of the Western metaphysical tradition: Aristotle, Kant, Leibniz, Hegel and Schelling. A passage from the *Beiträge* indicates that this work of reappropriation did not proceed haphazardly but was directed by a systematic intention:

To make visible the unfathomable pluriformity of Leibniz's way of questioning, yet to think Da-sein instead of the monad.

To repeat the principal steps of Kant, yet to overcome the 'transcendental' approach through Da-sein.

To question through Schelling's question of freedom, yet to set the question of the 'modalities' on another foundation.

To bring Hegel's systematic under a gaze that masters it, yet to think in a quite contrary manner.

To risk the confrontation with Nietzsche as the one who is nearest, yet to recognize that he is the one who is farthest from the question of Being.¹¹

Leibniz, Kant, Schelling, Hegel, Nietzsche: it can easily be seen that this series in fact corresponds to the major courses of this second period. In 1936, at the moment of the emergence of another new way of looking, in the most decisive change of all, Heidegger no doubt judged it necessary to reaffirm one last time the systematic purpose that animated the work he had done until then. 'To look metaphysics in the face' all through this period meant chiefly to ask himself about the *possibility* of a metaphysics! That meant to re-enact, in all its strangeness and outside the reassuring limits of an academic discipline, what one may call the '*meta*' function. An external, but revelatory, symptom shows the change of climate from the first period: in the course of this second period the term 'phenomenology' disappears from the titles of the courses – which of course does not mean that the cause of phenomenology is abandoned! – to be replaced by the term 'metaphysics'. After *The Basic Problems of Phenomenology* Heidegger first interests himself in the logic of Leibniz, but choosing to read it as the proposal of a metaphysics, as the title of the course shows: *The Metaphysical First Principles of Logic beginning from Leibniz*. Then comes *The Basic Concepts of Metaphysics*, 1929–30, which provided our basic formula. All these changes of title conceal deeper changes in the way of approaching the issues, changes sufficiently

important to be announced in the language of the turn, *die Kehre*, a term which now makes its appearance in the Heideggerian vocabulary. It is important not to confuse this with the famous turn in the question of being evoked in the *Letter on Humanism*, a turn situated around 1936 as the marginal notes of that text make clear.

(3) The interpreter who accepts the validity of this Heideggerian self-interpretation must thus deal with two turns: the 'metaphysical' turn of 1928–30 and a later turn which coincides with the discovery of the *Ereignis* and the exit from metaphysics. This second turn brings with it a mutation in the way of looking. One recalls the well-known passages from *Identity and Difference* which show – not only as an etymological exercise – that the *Ereignis* is an affair of looking,¹² because it is it which has always been looking at us.¹³ On their own such passages might seem too allusive to be exploited, but a careful reading of *Beiträge zur Philosophie*, now the principal document of the new turn, shows the degree to which throughout the discussion of the *Ereignis* the issue is one of discovering 'another way of looking'.

To learn this unprecedented way of looking is the task which from now on prevails more and more exclusively in Heidegger's thinking to the end. In the absence of a detailed analysis of this transformation of the way of looking, I shall content myself with a few summary notations, important for my thesis. I note first a negative declaration bearing on his relationship to metaphysics: 'In the domain of the other beginning there is neither "ontology" nor "metaphysics".'¹⁴ These lofty titles, each of which in its own way resumes the destiny of Western thought, are now no more than 'transitory names'. Moreover, since ontology has always been closely associated with logic, the other beginning signifies the rupture of that alliance almost as old as thought itself. But how is one to replace logic, especially the most accomplished logic produced by the history of philosophy, that of Hegel's *Science of Logic*? To this question Heidegger's response is curious, not to say paradoxical: the essence of logic consists in a *sigetics*.¹⁵ In thesis form: the logic of the *Ereignis* is a *sigetics*. I attempted to trace the contours of this paradoxical logic in my work *La parole heureuse*. My guiding hypothesis in that analysis was that the 'philosophy of language' of Heidegger's last phase should in reality be understood as an attempt to define the 'logic' of the other beginning of thinking. What was a mere working hypothesis in that work now finds explicit confirmation in Heidegger's statements in the *Beiträge*, for instance in paragraph 89, 'The transition to the other beginning': '“Logic” as a doctrine of correct thinking transforms itself into meditation on the essence of *language* as inaugural naming of the truth of being.'¹⁶ Numerous statements in the same work confirm, if that is still necessary, that the key figure in this transformation is Hölderlin

and that this poet occupies a unique place in the history of being grasped in the light of the *Ereignis*, so that 'the historical determination of philosophy culminates in knowing the necessity of creating a hearing for Hölderlin's word'.¹⁷

3 Beyond the science/*Weltanschauung* alternative

After this summary account of the genetic hypothesis which underlies the following reflections, I would like now to attempt a kind of reading backwards, through defining in a more precise way the state of the problem in the intermediary period which, for reasons which will progressively appear, seems to me the most promising for the confrontation for which I am preparing the ground. To do this I shall recommence from the text about 'looking metaphysics in the face'. The formula occurs in the long preliminary discussion which opens the course of the Winter semester 1929–30, *The Basic Concepts of Metaphysics*. The first chapter of the preliminary discussion is entitled: 'The detours in the direction of the determination of the essence of philosophy (metaphysics) and the unavoidable necessity of looking metaphysics in the face'.¹⁸ This talk of detours makes sense only on the premise that metaphysics is no longer what it was for the venerable tradition prevailing at least since Suarez and until Wolff: a firmly established discipline of philosophy, of which one could undoubtedly question one or other affirmation but of which the existence and the identity were not open to question. The first fundamental prejudice which Heidegger attacks at the opening of his course is just this conviction that metaphysics is an established discipline of philosophy.¹⁹ Contrary to appearances, metaphysics does not exist, it must be invented! This slogan, no doubt a rather cavalier one, sums up the message Heidegger wants to impress on his hearers at the outset. This unprecedented open-endedness of the question of the nature of metaphysics, no longer simply a matter of defining the epistemological status of an already existing discipline, makes it necessary to deal with various 'detours' which suggest themselves as we try to determine the essence of philosophical thinking. These detours take many forms and are of unequal value; but in each case one proceeds by a comparative method, that is, one tries to understand what metaphysics is through a comparison with what it is not. Heidegger insists that the first decision one must make is to refuse to be bound by the conventional alternative: either metaphysics is a science or else it is only a world view (*Weltanschauung*). Metaphysics as the *epistèmè zêtoumenê* (the science which is sought) which Heidegger wants to found can be neither of these. Against the upholders of absolute knowledge and against the neo-Kantians, it must be clearly asserted that philosophy (metaphysics) owes

nothing to science and is not comparable with it. But it must be said equally firmly that this does not condemn philosophy to be only the expression or elaboration of a world view.

This is not the first time that this alternative has occupied Heidegger's attention: the problem of the relationship of philosophy and world view comes up as early as 1919 in a course corresponding to the 'War need semester for war participants' which forms the first part of *GA 56/7* and carries the significant title: *Towards the Determination of Philosophy*.²⁰ Whether because Heidegger was conscious of addressing an audience traumatized by the experience of war or because he wanted to tackle a problem that was in any case a topical issue since Dilthey, this course, the earliest of those which have been preserved, begins with the *Weltanschauung* issue. For a disciple of Dilthey this term was not yet synonymous with ideology, though there is some overlap. The same issue occupies a considerable place in most of the introductions to the later courses up to *The Basic Concepts of Metaphysics*, where it is directly linked with the question of the possibility or impossibility of finding a definition of philosophy. In 1919 it seems to be connected rather with the 'philosophico-political' problem of university reform. Heidegger takes a stand in this debate at the start when he declares:

the much-discussed reform of the university is entirely misled and is a complete misconception of every authentic revolutionizing of the mind, if it now expands itself in proclamations, protest meetings, programmes, leagues and federations: means hostile to mind at the service of ephemeral ends. We today are not ripe for *genuine* reforms in the domain of the university. And becoming ripe for this is the affair of a *whole generation*. Renewal of the university means rebirth of genuine scientific consciousness and ordering of life.²¹

Against the phraseology of a philosophy degraded to 'ideology', it is above all important to recover the originary idea of science. Now this refusal to let himself be harnessed to the cause of an ill-conducted university reform is motivated by the notion that Heidegger has formed of philosophy in the proper sense, of which the primary and fundamental vocation is to realize itself as proto-science, *Urwissenschaft*. In his eyes, science understood in this originary sense is inseparable from a certain form of life. The *Urwissenschaft* is rooted in what he designates as an 'archontic form of life', that of 'the researcher who lives absolutely in the pure contents and origins of his problematic'.²²

Heidegger is aware that this bold position obliges him to match himself against a universal prejudice according to which 'every great philosophy perfects itself in a world view',²³ which proposes to give directions for living. What is the philosophical value of this universal need of a world

view which can be found just as much among the peasants of the Black Forest as among religious believers or factory workers, political militants or even scientists who advocate a 'scientific world view'? Can or should the philosopher recognize himself in this type of need? Two philosophical positions seem to be present here. On the one side, the widespread attitude that entirely ratifies the equation, philosophy = world view. On the other, the more nuanced position of the neo-Kantians, whom their obsession with the epistemological problem kept from making the world view the true immanent task of philosophy, and who saw in that notion rather an exterior limit of philosophy. But for Heidegger both positions are insufficiently radical. Going against all previous philosophy, he advances a still more radical personal thesis: the world view is a phenomenon foreign to philosophy, in other words: philosophy (correctly understood) has strictly nothing to do with a world view (correctly understood).

Hence the importance of clarifying the notion of philosophy 'correctly understood'. As we have seen, it has been designated *Urwissenschaft*, proto-science. This title seems to include a paradoxical demand, implying a vicious circle: how can one found such a science of the 'ultimate principles' which 'are to be grasped only from themselves and in themselves'?²⁴ To begin with, one must become aware that this circle is unavoidable and that the various efforts to bypass it lead to so many impasses. For there is no lack of attempts to locate on another ground this foundation of the science of foundations. The most facile of these has recourse to the genetic approach to the history of philosophy. If this has the merit of recalling that 'philosophy in the course of its history has always stood in a some determinate relation to the idea of science'²⁵ and has given itself the task of matching itself against scientific knowledge, the historical method on its own cannot resolve the specific problem of understanding which decides access to the idea of philosophy as a proto-science. Heidegger registers a first negative finding which contains a problem to be elaborated in later courses:

there does not exist a genuine history of philosophy, unless it be for a historical consciousness that itself lives in genuine philosophy. All history and history of philosophy in a capital sense *constitutes* itself in that life in and for itself which is itself historical – in an absolute sense.²⁶

The comparative approach which works out a typology of attitudes – in the manner of Karl Jaspers – is still more impracticable, since it brings us back directly to the *Weltanschauung* problem, as shown by Simmel's view that 'art is an image of the world, seen through a temperament; philosophy, on the contrary, can be apprehended as a temperament, seen through an image of the world'.²⁷ If then the only business of

philosophy is to create a world view, one has lost sight of the very idea of a proto-science. Heidegger, in these early days, rejects as well the way of 'inductive metaphysics' (Külpe, Messer, Driesch),²⁸ which relies on the particular empirical sciences in order to derive a philosophical idea of science as such. Must we conclude then that the viable interlocutors for the philosopher are the theoreticians of the teleological critical method invented by such major neo-Kantians as Rickert, Windelband and Lotze? It is indeed against these, some of whom were his own teachers, that Heidegger had first to match himself, as we see in his courses at the beginning of the twenties.

Heidegger saw from the start that it was not enough to adopt the opposition established by Rickert between the 'law of nature' as principle of explanation and the norm as principle of judgment which was at the heart of the so-called teleological critical method. Even if this method was a considerable improvement over a purely genetic one, it turned out to be incapable on its own of furnishing a criterion adequate to found philosophically an axiomatics.²⁹ The great neo-Kantian masters did not really succeed in bridging the gulf between empirical fact and universal validity. Or rather, they succeeded in doing so only by adopting a very special formulation of the method, namely the *Wissenschaftslehre* of Fichte for which 'the ought is the foundation of the is' (*Das Sollen ist der Grund des Seins*).³⁰ But as the fate of the Fichtean doctrine itself showed, the price to be paid was a heavy one: 'his teleological method turned about to become a constructive dialectic.'³¹ It is precisely because they could not agree to this option and had discovered 'the internal impossibility of a dialectic-teleological deduction of the system of the necessary forms and operations of reason',³² or in other words the sterility and unproductivity of dialectic, that the neo-Kantian theorists of the teleological critical method found themselves obliged to have recourse to the empirical sciences, psychology or history, in order to find a material 'cellaring'.³³ At least Heidegger owes this much to the great neo-Kantians: they closed off the path of dialectic to him for ever.

Heidegger turns his critical gaze on these experiential data which are necessary presuppositions of the teleological method. Does not the obligatory reference to them destroy the method of founding an axiomatics on the *ought* alone? It is maintained that the ideal norm is itself given independently of the real psychical elements that provide the material 'cellaring', and this trans-experiential *Sollensgegebenheit* would even be the originary objecthood, *Urgegenständlichkeit*?³⁴ But this decisive phenomenon, the very core of the method, remains entirely obscure, and the reference to it also further undermines the pretensions of the method to be a purely theoretical formation. Thus:

When without the least disquiet, because of an absolute blindness to

the world of problems enclosed in the phenomenon of the ought, one applies the ought as a philosophical concept, the result is unscientific chatter, which is not ennobled by the fact that one makes this ought the foundation stone of an entire system.³⁵

Rickert is the chief target of this polemic. Heidegger proceeds to quiz him with a view to clarifying the play of presupposition inherent in the apparently so obvious notion of *Sollenserlebnis* (sense of the ought). What is the relation between the notion of the ought and value? Are they synonymous or does one ground the other? Why insist that only a value can give any ought its basis? 'An ought can also be based on something that is' (*auch ein Sein kann ein Sollen fundieren*).³⁶ Moreover, the phenomenon of realizing that 'something has meaning' has its own originary constitution, not reducible to the ought.³⁷ These criticisms do not amount to a fundamental rejection of the legitimacy of describing knowledge in terms of the ought. Heidegger himself takes over the opposition between a derivative *Für-Wert-Erklären* (designation as value) and the originary phenomenon of *Wertnehmen* (apprehension of value).³⁸ But he presses the question as to whether truth itself can be said to constitute itself as an originary apprehension of value. He rejects the equation of *validity* with *value*, which Rickert wanted to make the point of departure of all philosophy, thus justifying the primacy of practical reason over theoretical reason. 'To end the confusion about the problem of validity it is essential to keep the phenomenon of value at a distance',³⁹ though truth may be a value in some wider context. In any case the numerous unjustified presuppositions that have come to light show how premature is the attempt to make first philosophy a philosophy of values. At most the status of the philosophy of values will be a derivative and partial one.

Heidegger agrees with Rickert that the one-sided domination of the theoretical should be overcome. This is not to be achieved by declaring a primacy of practical reason over theoretical reason, but rather by investigating how the proto-science which is sought – thus one might name a future 'metaphysics' – constitutionally needs to have recourse to a pre-theoretical sphere: 'the theoretical itself as such refers back to something pre-theoretical'.⁴⁰ That presupposed material basis of the theoretical is to be sought in the psychical in the widest sense. This prompts immediately another fundamental question: 'what, basically, is the psychical?' This question clearly goes beyond all questions about the epistemological status of empirical psychology; it asks whether there is a way to consider the psychical which would make of it the originary sphere in which the proto-science which is sought could establish itself.⁴¹ But this implies the necessity of dwelling descriptively in this sphere, renouncing theorems and opinions about it, so as to see how the

significations of things are constituted there and according to what mode of givenness.

Recalling the importance of the motif of the *es gibt* (there is, there is given) in the later thought of Heidegger it seems to me altogether remarkable that from the beginning of his teaching the question of the mode of givenness of phenomena is already formulated in terms of *es gibt*. 'Can there really be anything, if there are only things? In that case there are no things at all; there is not even *nothing*, because in a universal dominance of the sphere of things there is not any "there is" either. Is there a "there is"?'⁴² This question which at first sight seems a clumsy professorial play on words in reality marks the threshold which gives access to the identification of phenomenology as the 'theoretical proto-science'. And it is indeed to this first major philosophical decision that the science/*Weltanschauung* alternative brings us, for phenomenology and it alone makes it possible to transcend that opposition. But in Heidegger's eyes that represents a decision which has the allure of a true philosophical conversion, rendered still more solemn by the emphatic declaration:

we find ourselves at a methodical crossroads which decides the life or death of philosophy in general, before an abyss: either into nothingness, that is, the absolute domination of things, or else we manage to leap into *another world*, or more exactly: for the first time into the world as such.⁴³

So *hic Rhodos, hic salta*: every hearer of Heidegger is supposed to grasp that the first decisive choice is that for phenomenology as proto-science against the neo-Kantian philosophy of culture and values.

4 Towards grasping metaphysics without detour

In 1929, in the introduction to the course on *The Basic Concepts of Metaphysics*, the choice just mentioned has long become a reality, so that now the question can be posed as to where this choice allows one to go. It is all the more remarkable that Heidegger still feels the need to present this alternative once again to his hearers. But now the refusal to be bound by the science/*Weltanschauung* alternative has a different meaning: it is directly linked to the question of the possibility of metaphysics. Heidegger here embarks on what could be called, in Schelling's language, a 'tautological' determination of metaphysics, that is, one that tells directly what metaphysics is, one that attempts to grasp 'without detour' that which renders metaphysics incomparable with anything else.

One might well doubt whether this is possible, a doubt scarcely dispelled by the fact that, having set aside the twofold impasse of science

and world view, Heidegger proceeds to embark on yet another detour: the comparison with religion and art. This comparison played a major role in the thinking of some neo-Kantians, especially Rickert. The detour it inaugurates is qualitatively different from the preceding one, for while the passage through science and world view is unfaithful to the distinctive character of metaphysics, 'an unwarranted disparagement of its essence', the comparison with art and religion represents 'a fully warranted and necessary placing of its essence on an equal footing'⁴⁴ with them. It might be said that the first detour is in every case a road that leads nowhere, a *Holzweg*, while the second, though it too is closed off, seems none the less to promise a fruitful encounter. Another detour suggests itself: research into the history of the word 'metaphysics' – 'a remarkable history of a remarkable word'⁴⁵ – and of the discipline it names. This approach also fails to yield experience of the thing itself, for 'philosophy does not allow itself to be apprehended and determined by detours and as something other than itself'.⁴⁶

Rather surprisingly, the discussion now continues as if it devolved on the utterance of a poet, Novalis, to supply the password of a tautegorical interpretation of metaphysics and with it our capacity 'to look metaphysics in the face, never to lose sight of it again!'⁴⁷ 'Novalis says once in a fragment: "Philosophy is essentially homesickness, a drive to be at home everywhere" ' (*Die Philosophie ist eigentlich Heimweh, ein Trieb überall zu Hause zu sein*).⁴⁸ It is this statement which enables Heidegger to characterize the fundamental affect of metaphysics. Philosophy wants to be at home everywhere – which implies that it has no other home than this 'everywhere', in other words that its 'element' is none other than that uncanniness evoked in connection with anxiety in *Being and Time*. Novalis also intimates that something drives philosophical existence and keeps its quest going; it is this drivenness (*Getriebensein*), and not some limitation of its cognitive powers, that is the true mark of its finitude. Finally, the saying of Novalis has value only if assumed in the first person; the adventures it launches are always singular ones. The fragment thus prompts three questions: what is the world? What is finitude? What is singularization, that is, the solitude of *Dasein*? Taken together these three questions define the space within which metaphysical thinking proceeds.

Note that this poetic way of access occasions yet again a comparison between science and philosophy which is unfavourable to the former: while poetry is the 'sister' of philosophy, 'all science in relation to philosophy is perhaps only a handyman'.⁴⁹ Even if one makes allowance for the element of pedagogic exaggeration in the introduction to a course, this distribution of roles poses a riddle: why, on the basis of what criteria, is the poetic word not also a mere detour – at best an 'illustration' – on the way to metaphysics? In virtue of what does it yield

access to metaphysics? One might ask a still more sceptical question: what are the criteria which allow one to say that it is a poet which speaks in the fragment quoted and not a mere philosophical dabbler?

Be that as it may, once the fundamental mood (*Grundstimmung*) of homesickness is introduced, all the elements seem to be in place to characterize not only the major themes of metaphysical thinking but also its style or economy. Of this style Heidegger gives a twofold characterization – in two variations, so to speak, on the semantics of the German term *Begreifen*, to grasp, conceive, comprehend. On the one hand, metaphysical concepts or conceptuality presuppose that one has oneself already been grasped by a fundamental mood (*Ergriffenheit*).⁵⁰ On the other, metaphysical thinking should be conceived as ‘*inbegriffliches Denken* [thinking as total grasp] in this double sense: going to the whole and penetrating one’s existence’.⁵¹ Thus from a double point of view metaphysical thinking eludes the logic of conceptual representation. It plunges into an *Ergriffenheit* of which representation is not capable and, contrary to the habitual notion of it as a conceptuality reduced to abstract generality, it embraces all in itself, including in the first place the existence of the one involved in this activity. This implies that it is a ‘high-risk’ activity to which there inevitably attaches an element of ambiguity. Here Heidegger indulges in a third variation on the semantics of *Begreifen*, passing to the theme of *Angriff*, attack: ‘in philosophizing the Dasein in man directs its attack against man’.⁵² This means at least that the religious associations of *Ergriffenheit* must be left aside. Whatever else about metaphysics, it will never be a ‘beatific vision’, but is rather ‘the combat with the insurmountable ambiguity of all questioning and of all being’,⁵³ which is not of course to be seen as despairing activity, quite the contrary!

By this unconventional approach to his subject, Heidegger creates a problem which occupies him for the rest of the introduction to the course: why must recourse be had to the history of the term ‘metaphysics’ in order to characterize the functioning of the thinking just described? Or again: why not leave the term ‘metaphysics’ to itself? The question is all the more warranted in that the history of the word ‘metaphysics’ teaches us that it is not in fact an *Urwort*, a word of origin, one that ‘has formed itself out of a fundamental and originary human experience as its utterance’.⁵⁴ This is the case for such terms as *physis*, *logos* and *aletheia*, but the complex and eventful history of the term ‘metaphysics’ which Heidegger is intent on tracing has no such originary dimension.

At the end of his reconstruction of this history, Heidegger is faced with the following choice: once one had rejected metaphysics as a philosophical discipline, why still keep that which is most accidental – one is tempted to say most nominal – namely the term ‘metaphysics’? And his response is again quite disorientating: whatever about the history of this

word, it retains after all a link with that which should most deeply interest the thinker, namely the Aristotelian project of a *first philosophy* which is for him not the Aristotelian designation of one philosophical discipline among others but the characterization of philosophy in the proper sense. We could say that *metaphysics* is a name, doubtless misleading, but none the less unavoidable, to signal the fact that in speaking of *first philosophy* it is in reality *fundamental* philosophy – or rather fundamental philosophizing – that one seeks to determine. Such is the true nature of the task Heidegger assigns himself in this matter: instead of letting oneself be led by the traditional signification of the title,

*to first supply its signification to the already existing title starting from an originary understanding of the protê philosophia. In short: we should not interpret the protê philosophia starting from metaphysics but should rather, inversely, justify the expression 'metaphysics' by an originary interpretation of that which is afoot in the protê philosophia of Aristotle.*⁵⁵

In this sense the expression ‘“metaphysics” is the title of a problem’⁵⁶ and nothing else. And the only question one can address to the historical tradition of metaphysics is the question of the reasons for which this problem has never been perceived as a problem so that one has been content with a merely *exteriorizing* treatment, which consisted in making the supra-sensible a being-at-hand (*Vorhandenheit*) of a superior order, thus *confusing* continually supra-sensible being and the non-sensible characteristics of beings, and finally installing oneself in a complete *indifference* to the problems.⁵⁷

5 The chiasmus of the gaze

If then our dealings with the notion of metaphysics in reality concern the identity of *first philosophy*, we discover the true reason which makes the confrontation between Heidegger and Lévinas absolutely unavoidable. For the famous question of Lévinas, ‘is ontology fundamental?’,⁵⁸ makes sense only if we understand it as an effort to promote ethics to the rank of a first philosophy and thus place metaphysics above ontology. Implicitly present from the first pages of *Totality and Infinity*, the thesis of the primacy of ethics over ontology is formally enunciated in a version which puts directly in question the Heideggerian conception of the ontological difference: ‘Before the unveiling of being in general as the basis of knowledge in general, there pre-exists the relation with the being that expresses itself; the ethical plane comes before the ontological one.’⁵⁹ My working hypothesis on the capital point of difference between the

two thinkers is then the following: this debate, or *Auseinandersetzung*, between the positions of Lévinas and Heidegger is as necessary and as inevitable at the level of a post-Husserlian philosophy as that between Plato and Aristotle was necessary and inevitable at the dawn of metaphysics.

Let us try to make more precise the meaning of this confrontation and its stakes. As the quotation from Heidegger mentioned above makes clear, it was the jolt of the Aristotelian *einai pollachos legetai* discovered through the work of Franz Brentano thanks to the friendly and paternal complicity of Conrad Gröber which decided the direction of his philosophical itinerary. In Heidegger's self-interpretation the reference to that central motif of Aristotle's ontology plays a capital role, as attested by the 'Dialogue with a Japanese', the 'Le Thor Seminar', and the following passage from the *Zollikon Seminars*:

The impulsion of all my thought goes back to a statement of Aristotle which says that being is enounced in a multiplicity of ways. To tell the truth, that statement was the lightning-flash which triggered the question: what then is the unity of these multiple significations of being, what is the meaning of 'being' as such?⁶⁰

At first sight there is nothing of this sort in Lévinas's intellectual career. However, there is another text in the classical metaphysical tradition which occupies a similar place in his thought to that occupied by Aristotle's phrase in Heidegger's, the place of an epigraph and leitmotif which decides an itinerary. I refer to the famous Platonic motif of *epekeina tês ousias*, beyond being (*Republic* 509B). Already at a very early date, as we see from the first preface to *De l'existence à l'existant*, we find Lévinas invoking this motif to postulate the necessity of an 'exit from being and the categories which describe it'. In his eyes the Platonic formula means

that the movement which brings an existent to the Good is not a transcendence by which the existent raises itself to a superior existence, but an exit from being and the categories which describe it – and *ex-cendence*. But *ex-cendence* and Happiness necessarily stand on a basis of being and that is why it is better to be than not to be.⁶¹

Thus referred to the history of metaphysics the issue controverted between the two thinkers becomes a fundamental question bearing on the very nature of first philosophy: is metaphysics first of all an 'agathology' which places the good above being or is it rather in the first place an effort to elucidate the various senses of the word 'being'? Are these two approaches necessarily hostile to one another and if so for what

reasons? More exactly: what becomes in Heidegger of the motif of *epekeina tês ousias*? Inversely: how does Lévinas on his side interpret the Aristotelian motif of *einai pollachos legetai*?

These are assuredly vast questions. But the play of contrast between the historical epigraphs adopted by the two thinkers throws a decisive light, in my opinion, on the meaning of the choice between 'ontology' and 'metaphysics' as the name of first philosophy. That play is rendered more complex by the fact that in both cases the choice has to meet the requirements of a phenomenological *Ausweisung* (evidencing). There can be no question in the present context of opting definitively. Before resolving the alternative in one direction or the other one must meditate on it as such. Placing myself on the Heideggerian side, I would like to conclude by at least indicating some elements of a reply which are no more than altogether provisional benchmarks in view of a more thorough reflection.

If it is really first philosophy that is responsible for the 'problematic word' (*Problemwort*) 'being' the thinker is obliged to thematize the horizon whence the question of being arises. This is what Heidegger indicates in *Kant and the Problem of Metaphysics*, in a series of interrogations which are guided by the metaphor of looking:

How is the question 'What does Being mean?' to find its answer if it remains obscure as to from whence in general we can come to expect this answer? Must we not first ask: From whence in general do we lay hold of the point of view from which to determine Being as such and thus to win a concept of Being from out of which the possibility and the necessity of the essential articulation of Being becomes understandable? Hence the question of 'First Philosophy', namely, 'What is the being as such?' must drive us back beyond the question 'What is Being as such?' to the still more original question: *From whence in general are we to comprehend the like of Being, with the entire wealth of articulations and references which are included in it?*⁶²

What is striking in this cascade of interrogations is its progressive radicalization commanded by the question: 'in which direction should one direct one's gaze?' Once it is articulated, this question must draw the thinker irresistibly to some 'beyond being', giving a certain inevitability to the encounter with the Platonic *epekeina tês ousias* to which Heidegger devotes considerable space in the 1927 course *The Basic Problems of Phenomenology* as well as in the Leibniz course of the following year.⁶³

These references are more than a formal nod, as their insistent recurrence shows. There is nothing incidental about their appearance, which occurs in discussions of the key concept of Heidegger's ontology, namely the concept of understanding. To make of ontology the discourse in

which is deployed the *understanding* of being implies the need 'to find a sufficiently original concept of understanding'.⁶⁴ This concept entails the existential structure described as '*to project oneself upon a possibility*'.⁶⁵ And what holds for existential understanding must hold a fortiori for ontological understanding in turn: 'We understand a being only as we project it upon being. In the process, being itself must be understood in a certain way; being must in its turn be projected upon something.'⁶⁶ This understanding of being is inseparable from a fundamental mood which makes itself felt as a pre-understanding to be explicated in what Heidegger still calls a 'scientific ontology'. 'It is in the objectification of being as such that the basic act constitutive of ontology as a science is performed.'⁶⁷ But this constitution of ontology as a science (in a sense that lies beyond the science/world view alternative), in other words as an explication of the ultimate conditions of possibility of the understanding of being, implies the necessity '*of inquiring even beyond being as to that upon which being itself, as being, is projected*'.⁶⁸ It is in the course of this attempt 'to get beyond being to the light from which and in which it itself comes into the brightness of an understanding'⁶⁹ that Heidegger encounters the Platonic formula designating the Good as *epekeina tês ousias*. 'The understanding of being is rooted in the projection of an *epekeina tês ousias*'⁷⁰ he states explicitly. Far from adopting this formula in isolation, he immediately indicates that his interpretation demands a new reading of the entire allegory of the cave:

We, too, with this apparently quite abstract question about the conditions of possibility of the understanding of being, want to do nothing but bring ourselves out of the cave into the light, but in all sobriety and in the complete disenchantment of purely objective inquiry.⁷¹

'What we are in search of is the *epekeina tês ousias*.'⁷² What is the bearing of this search? Does it refer the understanding of being to an ethical transcendence? To the contrary, what is astonishing to the contemporary reader aware of Lévinas's use of the same motif, is that in all these reflections Heidegger scarcely adverts to the fact that the light of understanding comes specifically from the idea of the Good. That theme is touched on only towards the end of the analysis, but is instantly dismissed for a precise reason: the Platonic idea of the Good is itself tributary of an ontology of production (*Herstellung*) which makes of the Good 'the demiourgos, the producer pure and simple'.⁷³ And Heidegger wants to hear nothing about a demiurgic ontology! That is why his own interpretation – that is, his attempt to find a phenomenological signification for the *epekeina tês ousias* – quickly turns its back on the idea of the Good to introduce another motif, of which the least one can say is that it does violence to the Platonic text: it is originary temporality that

becomes for him the true name of the *epekeina tês ousias*. This shift is comprehensible if one recalls that understanding as such is structured temporally and that 'the instant [the *Augenblick*, the twinkling of an eye]⁷⁴ plays a signal role in it.

In the course on Leibniz, the same movement is repeated, though now the leading problem is that of the essence of transcendence. 'Dasein itself is transgression' (*Das Dasein selbst ist der Überschritt*).⁷⁵ Transgression, the act constitutive of Dasein, is not presented as the abolition of a limit – as it would be for Hegel: the transgression of the finite/infinite difference – but is a stepping beyond beings.⁷⁶ In other words, transgression is nothing other than the putting into operation of the ontological difference itself. This new concept of transcendence, which Heidegger opposes to the deficient epistemological and theological concepts of transcendence,⁷⁷ leads inevitably, once again, to a confrontation with the *epekeina tês ousias*. This time the critique of Plato takes a different course: the Platonic formulation of the ideas errs in making intuition – *theorein* – the act in which transcendence is supremely realized. Plato himself, under pressure from the phenomena themselves (!), was obliged to see that true transcendence exceeds the correlation idea/intuition.⁷⁸ A more originary transcendence emerges in the *epekeina tês ousias*. But again Heidegger shrinks from the idea that this more originary transcendence could announce itself through the idea of the Good. This time the reason for his shrinking is clearly indicated: it is the fear of falling back into the rut of a philosophy of values. Thought can make progress in this domain only by untiring phenomenological patience which attends to the mode of donation of the phenomena. From being an idea, the Good must return to being a phenomenon. Then it can manifest its true structure, as *Umwillen* (that in view of which we will). Thus in a *coup de force* Heidegger connects the transcendence of excess that emerges in the idea of the Good to the concept of world.⁷⁹ The idea of the Good then merely confirms the fundamental fact that Dasein is nothing other than the freedom to project a world. So again the way is cleared that leads to originary temporality as ultimate response to the riddle of transcendence. It is not the idea of the Good that allows Dasein to understand itself; on the contrary: 'Dasein as temporality poses to itself the task of understanding itself in its temporalization.'⁸⁰ And it is for this reason alone that one may say – what Kant already wanted to show – that metaphysics is part of human nature as such. Heidegger creates a forceful synthesis of the Aristotelian *hou eneka* (*Umwillen*), the Platonic *epekeina tês ousias* and the *potius quam* (rather than) of the Leibnizian principle of sufficient reason⁸¹ to make of the productive transcendental imagination (which is the other name of originary temporality) 'the first instant in which metaphysics tries to liberate itself from

logic⁸² and, we may add, borrowing the terminology of a later course, the instant in which ontology is obliged to change into *ontochrony*.⁸³

But can such an invocation of an originary temporality in favour of which the idea of the Good is eclipsed really be the last word on the riddle of transcendence? Or to put the same question in a more phenomenological way: is this all that can be said about the structure of the *Umwillen*? Is there not also an *Umwillen* which cannot be reduced to the projection of a freedom but which consists precisely in exposing oneself to the other? Such questions bring into view the gap between the Heideggerian and Lévinasian treatments of the Platonic motif. When it is a matter of determining the relations between metaphysics and transcendence,⁸⁴ Lévinas, too, allows himself to be guided by the word of a poet, in this case the voice of Arthur Rimbaud declaring that 'real life is absent'.⁸⁵ This poetic utterance places us at the antipodes to the statement of Novalis quoted above, in so far as it implies a fundamentally different determination of metaphysical desire: 'Metaphysical desire does not long for a return, for it is the desire of a country in which we were not born.'⁸⁶ It is because metaphysical desire is oriented to the absolutely other who is the other person that it becomes necessary to say that 'metaphysics precedes ontology'⁸⁷ and that ontology – including Heideggerian ontology as first philosophy – is suspected of being a philosophy of power and injustice.⁸⁸

It is to Plato's credit that he glimpsed the 'non-nostalgic character of desire and of philosophy',⁸⁹ despite the insufficiency of eros to manifest its true essence. In introducing the idea of the Good separated from the totality of essences, Plato obliged thought to articulate the relation between separation and the absolute. It is in this sense that the motif of *epekeina tês ousias* confronts us with a question which is quite central for any first philosophy worthy of the name: that of the articulation of transcendence and intelligibility. Thus for Lévinas the transcendence which the idea of the Good unveils has the sense of a separation from, a rupture with all forms of participation in a totality. To retrieve this sense we must step back from neo-Platonism to Plato himself:

Plato did not in any way deduce being from the Good: he posits transcendence as surpassing the totality. It is Plato who, alongside needs which are satisfied by filling an emptiness, glimpses as well aspirations which are not preceded by suffering and lack and in which we recognize the pattern of desire, the need of one who lacks nothing, the longing of one who does not fully possess his being, who goes beyond his plenitude, who has the idea of the infinite. The place of the Good lies beyond all essence in the most profound teaching, the definitive teaching – not of theology, but of philosophy.⁹⁰

The task of the phenomenologist as Lévinas conceives it and as he tries to carry it out in the rest of his book is to show in what sense 'the excess measured by desire is face'.⁹¹

'Looks which cross give birth to strange relations' says Paul Valéry in *Tel quel*. Nothing allows us to imagine that in coining this phrase Valéry was thinking of what Lévinas calls 'the oddnesses of the ethical'.⁹² But a little farther on when he is discussing the 'exchange' of looks and notes that it produces 'a transposition, a metathesis, a chiasmus of two "destinies"', we may ask ourselves if this is true only of the looks that we exchange with others. Are we not entitled to transfer the same remark to the look which thought turns on its own history' to read there – perhaps – a destiny. The confrontation of Heidegger and Lévinas seems to me in this sense not only a chiasmus between two 'destinies' but equally one between two possible destinations of thought.

The power of revelation of affectivity according to Heidegger

Michel Henry

As with Scheler, so also the thought of Heidegger is characterized, in counter-distinction to classical philosophy, by the importance which it accords to the phenomenon of affectivity ontologically grasped and interpreted as a power of revelation, as well as by the fundamental meaning which Heidegger's thought recognizes in it. This meaning is immediately apparent and shows itself in the fact that affectivity is not merely taken as a power of revelation in the ordinary sense of the word, a power of revealing something, this or that thing, but precisely *the power of revealing to us that which reveals all things, namely, the world itself as such, as identical to Nothingness*. The fact that the fundamental ontological and peculiarly decisive meaning of the power of revelation peculiar to affectivity most often remains unnoticed and does not call it in question merely shows that this power is in principle indifferent to the manner in which thought understands and habitually interprets it, to the manner in which the subject understands himself, the subject who experiences a feeling and then interprets it in order to hide its true meaning and what is in each instance agonizing in this meaning.

Nevertheless, in anxiety this meaning appears: 'Anxiety is the fundamental feeling which places us before Nothingness', thus opening to us the Being of everything which is, for 'the Being of a being is comprehensible . . . only if *Dasein*, by its very nature, maintains itself in Nothingness'. That anxiety places us face to face with Nothingness and thus opens Being itself to us, this is what confers upon it its fundamental and decisive character, and not the intention of arbitrarily making it a privileged tonality among others: 'Anxiety is declared to be the decisive fundamental faculty [736] [*Grundbefindlichkeit*], not in order to proclaim, from the point of view of some *Weltanschauung* or other, a concrete existence-ideal but solely with reference to the problem of Being as such.'¹

The specifically ontological fundamental character of anxiety is nevertheless not peculiar to it; in anxiety, affectivity itself is envisioned together with the power of revelation which in general belongs to it, viz. the power of maintaining itself face to face with Nothingness. For this reason, such a character is found in every affective disposition; regardless of what it is, this disposition opens the world to us in every case, its meaning in all cases is ontological. Fear opens the world to us as that through which the undeniable object whose approach arouses fear comes to us. In the same way, hope projects the space which separates it from that in which it sets itself to hope and wherein first the hoped-for thing shows itself to it. Hope and fear certainly do not discover the world in the same way that anxiety does; they do not hand us over to Nothingness in the same way. The discovery of fear is inauthentic, it takes place according to the mode of *Verfallen*. By this we must understand that fear guards against a being which it fears and not against its origin, namely, against the world as such; in fact, it hides from this, from the origin of all fears behind a being which it attends to. Attention to a being presupposes the discovery of the world and moves about in it. The inauthenticity of fear is a mode of this discovery, a mode of anxiety and its disguise. *The different tonalities are none other than modes according to which in various ways, whether authentic or not, either by making it apparent or by hiding it, the revelation peculiar to affectivity takes place, namely, the discovery of the world as such and its Nothingness.*

Transcendence is what discovers the world in the very act whereby it projects it beyond a being as its horizon. [737] *To the extent that affectivity opens the world to us and places us face to face with Nothingness, its power of revelation resides in transcendence itself and is constituted by it.* The following evidence henceforth presents itself without delay: *The essence of revelation peculiar to affectivity and taking place in it is completely lost to Heidegger, confused by him with the essence of the ontological understanding of Being to which it nevertheless remains heterogeneous both in its structure and in its phenomenality.* Thus stripped of the power of revelation which properly belongs to it and whose essence is in no way recognized, affectivity keeps its ontological meaning, and more specifically, the power of revealing something only insofar as, confused with transcendence, it works after the fashion of transcendence and in the manner of an act taking place in the milieu opened by transcendence, regardless of the mode, whether authentic or inauthentic, according to which such an act takes place: 'One's mood discloses in the manner of turning thither or turning away from one's own *Dasein*.'² Because affectivity, to the extent that it accomplishes the work of revelation, works after the fashion of transcendence, namely, on the foundation in it of the ontological power of the understanding of Being, a given feeling and every possible feeling in general, can be no more than a brute and blind

fact, of itself foreign to the element of phenomenality, a fact only through the mediation of this power and as a mode of understanding. 'Every *Befindlichkeit*', says Heidegger, 'is one in which one understands.'³

To the extent that the power of revelation which is thought of as belonging to the ontological understanding of Being and residing in transcendence, affectivity, in keeping with the *eidos* of this power, necessarily reveals something other than itself and its own essence, something other, namely (1) the world, i.e. the pure milieu of otherness, and (2) a being which [738] manifests itself in this milieu in the form of Being-other and as an object. Nevertheless, this is a far cry from limiting the power of affectivity to the revelation of the world. Each *Befindlichkeit* 'discloses the total Being-in-the-world in all those items which are constitutive for it'.⁴ Disclosing the total Being-in-the-world in all its items, affectivity reveals the world as co-belonging to this total structure and carried along by this structure, but also and in a more essential manner, carried along by Being-in as such, existence itself ontologically interpreted and grasped as constituted by this 'Being-in', by transcendence. Nevertheless, affectivity does not float in thin air, as an abstract power separated from existence and burdened with grasping it; it is the affectivity of existence and belongs to it as its most essential determination. That affectivity reveals the total Being-in-the-world in all its items consequently means that in it, in each of the tonalities in which existence exists and realizes itself, is revealed existence itself, existence as ontologically interpreted and grasped as Being-in and as transcendence. Here the radical meaning of the power of revelation peculiar to affectivity is discovered, viz. that of revealing, not merely a being, not merely the world wherein a being appears, but the very power which discloses the world to us in the projection of Nothingness. With affectivity there comes a sort of possibility which transcendence has, by revealing itself to itself and hence maintaining itself in itself within the structure of this revelation and its unity, of constituting itself as a coherent and concrete essence.

Such a possibility for transcendence, for existence, of revealing itself to itself and hence of constituting itself as a coherent and concrete essence, the possibility for the ontological foundation of every possible manifestation in general of founding itself, is neither theoretical nor abstract; because it defines the essence of existence and its ultimate foundation, this possibility is visible in it as its affectivity [739] and can be recognized in each of the dispositions and tonalities in which existence exists and realizes itself. For example, fear reveals not merely or primarily the object whose menacing approach arouses fear nor the milieu in which this approach takes place and in which the menacing object arises; this object could not be menacing and could not arouse our fear unless existence, rather than simply surpassing itself toward the object as toward an exterior reality which would not really concern it, permits it to turn

back as it were, back to this existence which is handed over to the object at the very interior of the relation which it maintains with the object, unless in fear existence originally reveals itself to itself as handed over to the world and bound to it. This revelation of existence to itself in fear – existence in fear – it is true, hides fear from itself; it hides the anxiety which harks to existence handed over to the world; fear projects this anxiety onto a being to which it attends and which it takes as its origin or cause. The flight of existence toward the object of its fear nevertheless presupposes, as flight from itself, its revelation to itself, the original self-revelation of existence such as takes place in its very affectivity. Nevertheless, it pertains to the original self-revelation of existence in affectivity that, as revelation of the world which is consubstantial and contemporaneous with it, it can take place either in an authentic or in an inauthentic way.

The original self-revelation of existence in affectivity takes place in an authentic way in anxiety. In anxiety, existence ceases to lose itself in the intramundane being about which fear is anxious; rather, this being has moved into the shadows of indifference; the tasks which it calls for and through whose mediation it presents itself to us in a mode of life fallen into daily banality appear deprived of meaning; now there alone appears, as its true Being, the Nothingness of a being, the world as such. Moreover, anxiety, in its encounter with the world and its Nothingness, does not merely reveal the world, it finds itself returned to Being-in-the-world as such, to existence [740] itself as handed over to the world. To the extent that it is handed over to the world, existence is first of all handed over to itself; this is precisely what reveals to it its anxiety; this anxiety brings existence face to face with itself, it reveals it to itself, it reveals to it the fact of its existence and at the same time what it is, i.e. its Being handed over to itself as Being handed over to the world. That the revelation of existence itself, of its Being handed over to itself in order to be handed over to the world, takes place in an inauthentic manner in fear and likewise in the ensemble of affective tonalities of existence, while it takes place in an authentic manner in anxiety, this means that *this revelation is not peculiar to anxiety; like the revelation of the world, the revelation of Being-in-the-world, the revelation of existence to itself is the fact of affectivity as such.* For this reason, such a revelation takes place in each of the affective tonalities of existence, tonalities which precisely represent diverse modes according to which this revelation takes place, viz. *the modes of revelation to itself of existence as originally and essentially constituted by its affectivity.* Each affective disposition, says Heidegger, 'brings Dasein more or less explicitly . . . face to face with the fact that it is'.⁵

The ontological determination of the power of revelation peculiar to affectivity is identical to that of affectivity itself, to the determination of

its nature and the essential structures which constitute and define it. Because in its affectivity, in each of the tonalities in which existence exists and realizes itself, while it reveals the world to which it is related and handed over, existence reveals itself to itself such as it is; feeling, on the foundation in it of this essence which constitutes feeling and determines it, permits itself to be determined as what it is, as a feeling which is never merely or primarily a feeling with regard to the world and to what manifests itself in the world, i.e. a feeling with respect to an object, but also and [741] necessarily, in this revelation of existence to itself which constitutes its affectivity, a way for it to sense itself, to experience itself, a feeling of self. Hence it is that pleasure, for example, 'is not only pleasure in something', or the pleasure of possessing it, 'but also a state of enjoyment – a way in which a man experiences joy, in which he is happy. Thus, in every sensible (in the narrow sense of the term) or non-sensible feeling, the following structure is to be found: feeling is a feeling *for* . . . and as such is also a way of feeling oneself.' And further on: 'Feeling is having feeling for . . . so that the ego which experiences this feeling at the same time feels itself.'⁶

Nevertheless, upon what is the structural determination of feeling as feeling of self founded? What is the essence of existence insofar as it reveals itself to itself in its affective dispositions? *In what does the power of revelation peculiar to these dispositions, the power of revelation of affectivity, consist?* 'In every mood wherein "things are this or that way" with us, our own *Da-sein* is manifest to us. We have, therefore, *an understanding of Being* even though the concept is lacking. This pre-conceptual comprehension of Being, although constant and far-reaching, is usually completely indeterminate.'⁷ The power of revelation of affectivity consists in the ontological understanding of Being. The essence of existence insofar as it reveals itself to itself is transcendence. When, therefore, in anxiety, for example, existence, no longer being able to lose itself in the object of its concern and coming into conflict with the world, finds itself returned to itself, to the *in-der-Welt-sein* as such, then its revelation, the revelation of existence to itself, credited to anxiety, is the fact of transcendence and finds its essence in the structure of the ontological understanding of [742] Being and takes place as a mode of this understanding: 'But when our "*Verstehen*" has come up against the world, *it is brought to in-der-Welt-sein* as such through anxiety.'⁸

Because in anxiety existence finds itself face to face with itself, the in-the-face-of (*Wovor*) of anxiety turns out to be identical to the about-which (*Worum*) existence is anxious, namely, its own existence. Because the revelation of existence to itself takes place in anxiety as a mode of the ontological understanding of Being, the *Worum* of anxiety is not merely identical to its *Wovor* as having the same object; it further finds in it, in the structure of a mode of presentation which it essentially

achieves as a presenting in-the-face-of its own structure. It is in this ontologically radical sense that the *Worum* of anxiety is identical to its *Wovor*, insofar as it itself takes place as a *Wovor*, as a mode of transcendence. To put existence in the presence of itself, to confront it with itself in such a way that this 'bringing-in-the-face-of' does not merely mean 'to reveal' in some undetermined manner, but designates the mode according to which this revelation takes place and also its internal structure as constituted by transcendence, this is the fact of affectivity in general.

Because this bringing of existence into the presence of itself takes place in each instance in affectivity as a mode of transcendence, it is likewise in every instance and necessarily invested with the form of an ecstasy. The ecstatic structure of the relation to self of existence in affectivity is visible in all its tonalities, including those wherein this relation takes place according to the inauthentic mode of 'decadence'. If fear reveals existence to itself and consequently is essentially determined in its very possibility as a fear for self (*Sichfürchten*), it is a 'specific ecstatical unity [743] which makes the *Sichfürchten* existentially possible'.⁹ In the same way hope, to the extent that it is never merely the awaiting of a future good but first concerns, as hope for self, him who hopes, presupposes the ecstatic relation of existence with oneself as the only possible ontological foundation of 'hoping for something for oneself' which really constitutes 'the affective character . . . of hope itself'.¹⁰ If the relation of existence to self, i.e. its revelation to self in affectivity, takes place in every case as a mode of transcendence and for this reason is invested with an ecstatic structure, this is because this revelation is not the fact of affectivity considered as a specific power, distinct from existence and serving as its foundation, but that it rather belongs to existence itself as identical to transcendence. It pertains to transcendence, to existence, upon the foundation in it of its own structure, namely, precisely as existence, as transcendence, to relate itself to itself at the same time that it relates itself to the world. 'It is essential to *Dasein* that along with the disclosedness of its world, *it has been disclosed to itself, so that it always understands itself*'.¹¹ Here we see in its full light the fundamental ambiguity of the Heideggerian *Erschlossenheit*. The revelation of existence to itself is ontologically homogeneous with the revelation of the world; the power of affectivity whether it be understood as the power of revealing existence or of revealing the world is the same, it is the power of transcendence.

The power of the revealing of existence to itself, thought of as the power of affectivity, is not merely ontologically homogeneous with the power of revealing the world; it is not merely a question of the same power either, as if this power could freely 'wheel and deal' either with existence itself or with the [744] world; *it is through one and the same*

act of this unique power that there takes place conjointly and necessarily in affectivity, the revelation of existence and of the world. The unique power whereby there takes place conjointly and necessarily in one and the same act of this power the revelation of existence and of the world is time. Time, in its original temporalization, is the movement whereby existence, projecting the horizon of the future in advance of itself and coming into confrontation with it, turned back by it and brought back to itself, discovers in the unity of this twofold movement, in the ecstasy of the project 'in advance toward' contemporaneous with the ecstasy of the return 'back upon', both the world as finite world and its own existence to which it is handed over. *The power of revelation of affectivity is precisely the power of time.* It is time which, in fear, opens up the horizon wherein the menacing object to come arises; it is time which permits this object to turn back to the menaced existence and in this turning back to it, uncovers existence to itself in the ecstasy of its inauthentic past. It is time which causes the pure horizon of the future to arise in-front-of 'anxious existence' as a finite horizon, as the horizon of its death; it is time which, permitting this existence to turn back to itself starting from this horizon, uncovers existence to itself in the ecstasy of the authentic past as a finite, fallen existence handed over to the world as to its own death. That the revelation of existence to itself, and in parallel fashion the revelation of the world, takes place in affectivity in an authentic or inauthentic fashion, results precisely from the fact that it pertains to temporality to temporalize itself in principle in different ways, whether authentic or not. Nevertheless, temporality is only transcendence itself in the mode of its effective and concrete accomplishment such that its temporalization necessarily occurs in an ecstatic form so that the different ecstasies which constitute it and in which it takes place, constitute diverse modes of realization of transcendence itself. Consequently, that the power of revelation of affectivity is [745] that of time means that the power of revelation of affectivity is the power of transcendence.

When it is understood as the power of transcendence, the power of revelation peculiar to affectivity is lost – together with the very nature of affectivity as constituted by this power. *The existential ontological interpretation of affectivity as temporality brings about the disappearing of what properly constitutes the affective character of what is affective and loses this character in principle; it loses in principle the essence of affectivity as such.* Heidegger had a presentiment of this truly essential lacuna in the philosophy of affectivity as presented in *Sein und Zeit*: 'If we are to interpret *Befindlichkeit* temporally, our aim is not one of deducing *Stimmungen* from temporality and dissolving them into pure phenomena of temporalizing. All we have to do is to demonstrate that except on the basis of temporality, *Stimmungen* are not possible in what they

“signify” in an existentiell way or in how they “signify” it.”¹² However, just what are these *Stimmungen* independently of what they ‘signify in an existentiell way’, independently of their power of revelation understood as the power of transcendence? The thought of Heidegger is characterized, at least this is one of its most remarkable traits, by the deliberate rejection of psychologism considered as one of the modes of thought of consciousness which clings to a being without asking about its Being; it is characterized, as far as feeling is concerned, by the refusal to consider it as a ‘fact’, a ‘psychic fact’, a ‘state of the soul’, a ‘lived state’, all of which are determinations in which the Being of affectivity, the essential and fundamental meanings with which it is invested as an original power of revelation, are lost, whereas feeling itself, fallen to the level of an object, henceforth presents itself as the simple correlate of a thought or an action.

This ‘falling’ of feeling is particularly obvious in [746] the modern world of technology where the will, treating everything in its relation to itself and in this way considering it as the object of its will and its action, renders thought blind to what takes place and encloses the event in its blindness in such a way that nothing, not even suffering, precisely because the latter is itself reduced to the condition of an object on which one can act, is capable of producing any change: ‘Even the immense suffering found all over the world cannot directly inaugurate any change because we experience it merely as suffering, viz. passively, as an object for action and consequently as lodged in the same regions of Being as action: in the region of the willing of the will.’¹³ Furthermore, this is why at this time when metaphysics is ‘breathing its last’, in this world of technology which constitutes the last step of metaphysics and finds in psychologism as it does generally in the extraordinary development ‘of the human sciences’ to which technology gives rise a remarkable illustration among others ‘under the reign of the will’, therefore, ‘it almost seems that the Being of suffering as well as the Being of joy is closed off to man’.¹⁴

However, the surpassing of the metaphysics of the will and the surpassing of the psychologism cannot take place with regard to feeling, this latter cannot be anything more than a state viz. the ontological element of manifestation, and hence, as Heidegger explicitly states, ‘a mode of self-consciousness’, a ‘pure feeling’,¹⁵ unless this ontological element which constitutes the Being of feeling is grasped as being its own, as its own essence. Nevertheless, what element does the philosophy of transcendence possess in order to sketch an ontological interpretation [747] of the Being of feeling, unless it be transcendence itself? *To the extent that he rejects psychologism, Heidegger finds himself forced to found the Being of feeling on the ecstatic relation of Being-in-the-world and to understand it as a determination of this relation.* ‘Freedom’, says

Vom Wesen der Wahrheit, 'means participation in the revealment of what-is-in-totality, freedom has attuned [*abgestimmt*] all behavior to this from the start. But this attunement [*Gestimmtheit*] or mood [*Stimmung*] can never be understood as "experience" and "feeling" because, were it so understood, *it would at once be deprived of its being* [*Wesen*] and would only be interpreted in terms of, say "life" and "soul" – which only *appear* to exist in their own right [*Wesensrecht*] so long as they contain any distortion and misinterpretation of that attunement. A mood of this kind, i.e. the ex-sistent exposition into what-is-in-totality, can only be "experienced" or "felt", as we say, because the "experient" without having any idea of the nature of the mood, is participating in an attunement revelatory of what-is-in-totality.'¹⁶

The reduction of the essence of affectivity to the essence of transcendence takes place in two ways. First of all, affectivity is understood as a determination of transcendence in such a way that transcendence, the ex-sistent exposition into what-is-in-totality, is invariably affected by a tonality, bound to it and always accompanying it, transcendence takes place as an affective attunement. 'All understanding', says Heidegger, 'is accompanied by a state-of-mind.'¹⁷ Or again: '*Dasein* is constituted by *Erschlossenheit* – that is, by an understanding with a state-of-mind.'¹⁸ Because understanding always takes place in a certain affective situation, it is logical for the problematic to ask, [748] when faced with a determined mode of its accomplishment, 'which *Stimmung* corresponds to this understanding'.¹⁹ The *Erschlossenheit* of *Gewissen*, for example, may thus be characterized as the understanding by existence of its abandonment, an understanding to which anxiety corresponds as its specific tonality.²⁰

Nevertheless, on what is the correspondence of understanding and the *Stimmung* in *Erschlossenheit* founded? Why does transcendence necessarily become reality in an affective form? The impossibility of permitting the affective character of transcendence merely to subsist side by side with it as an unfounded determination and as a gratuitous presupposition, explains why an attempt is made very quickly – in spite of the affirmation of the irreducibility of *Stimmungen* to the pure phenomena of temporalization – to give a foundation to these *Stimmungen*, not merely their existentiell meaning but specifically their affectivity, on the very Being of understanding which they determine in each case, i.e. on the ecstatic structure of temporality. The reduction of the essence of affectivity to the essence of transcendence now takes place in such a way that it leads to their pure and simple confusion. This confusion is obvious when it is said that we must 'exhibit . . . the ontological structure of having-a-mood in its existential-temporal constitution', that more precisely, '*Befindlichkeit* temporalizes itself primarily in having-been', that is to say 'in the *Geworfenheit*', that 'the existentially basic character of *Stimmungen* lies in bringing one back to something', in brief, that the properly ontological

element of affectivity, its Being, resides in the ecstatic structure of transcendence and in the concrete modes of its temporal accomplishment. Because its Being, that which is properly ontological in it, resides in the very structure of transcendence, affectivity is not merely juxtaposed [749] to transcendence and henceforth as an unexplained determination, but the affective character of understanding ceases to be a presupposition without foundation and it is possible to comprehend 'how the ecstatic unity of one's current temporality will give any insight into the existential connection between one's *Befindlichkeit* and one's *Verstehen*.'²¹

That the ontological structure of affectivity resides in its existential-temporal constitution is not something that can be merely affirmed. Heidegger undertakes to show it. If the simple waiting for a menacing object which approaches is not fear, this is because 'it is so far from being fear that the specific character which fear as a mood possesses is missing'. This character resides, according to Heidegger, in the fact that the waiting of fear concerns existence itself; it is not a simple waiting but a sort of 'anticipation', it resides in the fact that 'in fear the awaiting [anticipation] lets what is threatening come back to one's factually concerned potentiality-for-Being', namely, to come back to existence itself, co-discovered by itself in this movement of turning back to, namely, in the ecstasy of the past. 'The awaiting which fears is one which is afraid "for itself", namely, fearing in the face of . . . fearing about; *therein lies the character of fear as mood and as affect*.'²² *However, the discovery of existence by itself in the ecstasy of the past as 'factual' existence which is approached by the menacing object coming back to it from the future, as such, i.e. as a transcendent perception homogeneous to the simple perception of the menacing object in the future, no more than this latter, does not contain anything affective, or anything which can constitute something like an affective characteristic such as the characteristic of 'Stimmung' of fear. Such a discovery could very well take place in a purely theoretical consciousness, in a consciousness which is indifferent – or better a-tonal – to its own existence [750] and to the object which comes toward it. Moreover, it is as a consciousness of this sort, viz. as a purely theoretical consciousness, indifferent and a-tonal, that the discovery of existence to itself would take place, if it were to take place in the ecstasy of the past or, in a general way, as a mode of transcendence. Founded solely on the ecstatic relation, no fear is possible.*

No anxiety is possible either. Never could a grasping of an existence abandoned and doomed to death, as to that which dominates the very horizon of its world and its time, be able to arouse the *Stimmung* of anxiety if it were to take place under the form of a simple apperception and as a mode of understanding, as an ecstatic relation. Actually, such an apperception is of itself no more than the indifferent presentation of an indifferent object, and the understanding of existence as Being-unto-

death in no way determines this understanding as anxiety. This it cannot do; *the abandonment of existence handed over to the world in death is not terrifying or agonizing, unless the power which discovers this abandonment is capable not only of discovering it – in what is of itself the a-tonal opposition of the ecstasy – but of being terrified, of being anxious, unless this power is not merely an understanding but is once and for all constituted in itself and prior to everything which it can understand, as affective and capable of being determined affectively, as affectivity.* Understanding is assuredly affective and for this reason the a-tonal consciousness of the simple apperception here postulated by the problematic as that of ecstasy, namely, of opposition, never takes place, or takes place only as an indifferent consciousness. The affectivity of understanding resides, not in itself nor in the ecstatic structure which the understanding develops in each case, but in the anti-structure of this structure, in the anti-essence of transcendence. The entire ambiguity of the philosophy of transcendence consists in presupposing the affectivity of understanding, a presupposition which does not merely presuppose the essence of affectivity but which, by reducing it to that of the understanding itself and confusing it therewith, denies it. [751]

The preceding remarks are valid, let it be understood, for all species of feelings including those which, like resentment, presuppose opposition and seem to find in it a principle of sufficient explanation. Let us consider revenge. According to Nietzsche, it is 'the resentment of the will toward time and its "there was"'.²³ Actually, the will comes into conflict with time, with its 'passing' and with what takes place in it and with the past, as a thing before which it is powerless and from which it suffers. The suffering impotence of the will determines in it the spirit of revenge whereby it belittles everything which happens and even life itself, while at the same time it posits the absolute of supraterrrestrial ideas. This spirit of revenge determines man's meditations, namely, the manner in which he understands his relation to the Being of a being and lives this relation. Because this spirit of revenge determines man's relation to the Being of a being, Nietzsche, says Heidegger, 'from the outset thinks revenge metaphysically'.²⁴ What is important in revenge is not so much that to which it is opposed, namely, time and its 'there was', but the very fact that it is opposed to it, i.e. opposition as such. This is why the spirit of revenge endures when, rather than despising it 'a man who suffers much takes life under his wing',²⁵ lives it as a broadened experience (Dionysius) and absolutizes the becoming in the eternal Return of the identical.

The fact that in vengeance opposition as such is important, this is precisely what makes of it a metaphysical characteristic. 'Metaphysical thought', says Heidegger, 'rests on distinction'.²⁶ Actually, not on the distinction between what truly is and what is merely apparent, but on

the distinction whereby existence [752] relates itself to Being as constituted by this very distinction, as opposition. Opposition to Being understood as time – whether this opposition be instituted in order to ‘value’ or devalue it – is Being itself, is time. With the metaphysical thinking of revenge, there arises the possibility of an exhaustive existential-temporal interpretation of the Being of this feeling, for revenge is completely explained by time when it designates a relation to time constituted by time itself. However, that which is lacking to this existential-temporal interpretation of the Being of revenge is no less than the affective character of the relation whereby existence relates itself to what takes place and assumes an attitude regarding it, is nothing less than the affective character of revenge. Because such a character never resides in opposition as such, so neither can opposition explain other feelings which seem to find in it and in the separation which in each case constitutes their natural origin, viz. the suffering of separated-Being, i.e. nostalgia. It is true that transcendent Being – and the world in general – which never finds the condition of its presence and its proximity except in the remoteness of separation arouses our suffering: ‘Nostalgia’, says Heidegger, ‘is the pain which the proximity of remoteness causes us.’²⁷ But the transcendence of the world, if it constitutes the foundation of the separation from which nostalgia suffers, never constitutes the foundation of the suffering characteristic of this separation, i.e. nostalgia itself and its affectivity, which does not reside in the act of this transcendence, but in its original auto-affection and in the very essence of affectivity.

That transcendence never constitutes the foundation of affectivity and does not constitute its essence we see in the fact that it likewise does not found that to which affectivity is bound by virtue of an essential connection, namely, ipseity. Such a connection can be comprehended in the existential-temporal interpretation of affectivity where the [753] power of revelation of affectivity, understood as the power of time, no longer concentrates on the world, but on the existence handed over to it, in such a way that this existence takes first place as the peculiar, and so to speak, specific content of this power, in such a way that it is existence itself which in affectivity discovers itself and reveals itself to itself. That this revelation to self of existence, its original relation with self, and ultimately its Being-self, presents itself as an essential determination of its affectivity and as consubstantial with it we see still more clearly when it is said, with regard to hope, that its ‘character as a mood lies primarily in hoping as hoping for something for oneself’, which, adds Heidegger, ‘presupposes that he has somehow arrived at himself [*ein sich gewonnen haben*].’²⁸ The ‘having arrived at self’ of existence, presupposed in it as the very possibility and essence of its affectivity, because it constitutes this essence, can be seen in each of its tonalities: in fear to the extent that it is originally and necessarily determined as ‘fear for

self'; in anxiety which, in the same way, is possible only as the anxiety of *Dasein* confronted with its own existence and as anxiety for it. *It is precisely because the having-arrived-at-self of existence and its original revelation to itself, plus that which in every case determines it as a self, find their foundation in the ecstasy of the past that the past plays, in the ontological interpretation of affectivity as temporality, the role peculiar to it and ultimately presents itself as the foundation peculiar to affectivity and its essence in such a way that the different tonalities appear as diverse modes of its realization, that, for example, the 'Befindlichkeit' of anxiety is explicitly presented as constituted by a specific ecstatic mode of the past.*²⁹ However, in its relation to itself such as takes [754] place in the ecstasy of the past, existence can relate *itself* to whatever it is related only to the extent that it is henceforth constituted in itself as a self; it can relate itself as *to itself* only to the extent that this Self, cast into the milieu of otherness opened by the past, and yet presenting itself in this otherness as a self and as its own self, is nothing other than the objectification of its original Self and its representation.³⁰ No more than opposition in general, and precisely because it is a mode of this opposition, can the ecstasy of the past constitute the ipseity of existence consubstantial with its affectivity or constitute its foundation; rather it presupposes ipseity as its peculiar condition.

The impotence of opposition as constituting of itself the essence of ipseity becomes obvious when the problematic undertakes to determine the 'transcendental, fundamental structure of the transcendence of the moral self'.³¹ It is noteworthy that the question of this determination of the Being of the self starting from transcendence intervenes interior to an analysis explicitly oriented toward grasping the essence of respect and through it toward the essence of feeling in general. How does this determination of the essence of ipseity starting with transcendence take place in feeling, and more especially in respect? How does respect constitute in itself the Being of the Self? Insofar as it reveals this Self. 'In respect for the law, the ego which experiences this respect must also, in a certain sense, become manifest to itself. This manifestation', adds Heidegger to emphasize its essential character, 'is neither subsequent [to the acts] nor is it something that takes place only occasionally.'³² *In what does it consist? In no way in respect itself nor in what makes it what it is or in the original revelation of its Being to itself which is as such constitutive of its affectivity as well as of its Being-self [755] and of the essence of ipseity in it.* The revelation of the ego to itself in respect, as Heidegger and Kant understand it, is only indirect; it takes place through the mediation of a complex process which, far from founding the Being of the ego, rather presupposes it as the very condition for its accomplishment. Such a process is nothing other than transcendence itself. The revelation of the ego to itself taking place 'in respect', but in fact through

the mediation of transcendence, breaks down as follows: Respect uncovers the law in such a way that this uncovering is precisely the task of transcendence; nevertheless, the law is the law of action, it commands action; consequently it implies and presupposes an ego which submits itself to its commandment and accomplishes it. To this simple presupposition of an acting self submissive to the law is actually related the entire content of a proposition such as the following: 'Respect for the law – this specific way of making the law manifest as the basis of the determination of action – is in itself a revelation of myself as the self that acts.'³³ Thus, the order of factors, the hierarchy of essences, is reversed: From opposition taken as self-evident, from the representation of the law, viz. ultimately from the simple concept of the law, is deduced the real existence of an ego who nonetheless constitutes the ontological condition for the possibility of and the foundation for this representation, for this concept as for all opposition in general, while this deduction is baptized with the name of a 'disclosure'.

Far from being able to be deduced from the representation of the laws and as that which is submissive to it, the ego rather constitutes the ontological condition for the possibility of and the foundation for this representation, for opposition in general; this we see in the fact that reason presents the law to itself³⁴ in such a way that the Being of this [756] reason, and prior to this, its Being-self, i.e. that which allows it to present the law to *itself*, is again simply presupposed in such a way that the ego which presents the law to itself, for lack of appearing in respect and of being grasped in respect as its very affectivity, is now no more than some condition 'x', some metaphysical reality. Between the metaphysical reality of the ego of reason which posits the law and the empirical reality of the ego which submits to it in respect a difference now intervenes which stems not merely from the fact that the first ego eludes the sphere of experience in which the second is plunged but from the very nature of the relation which is established between the two, insofar as this relation, mediated through the representation of the law and constituted by it, is constituted by the difference itself as such.

Because the two egos, the one which posits the law and the other which submits to it, are defined starting with the difference of the representation and consequently as essentially different, the affirmation of their unity, the affirmation according to which 'respect for the law' (with regard to the metaphysical ego wherein it finds its origin) 'is respect for oneself'³⁵ also remains without foundation. The ontological interpretation of the Being of the ego starting with transcendence, here more precisely starting with the representation of the moral law, presupposes in each case not merely the ipseity of the two egos which it is led to posit starting from this representation but also the ipseity of the ego as such, *and*

furthermore it likewise causes the break-up of this ego into an unthinkable plurality of different and irreducible egos.

To the ego of experience which encounters the law and to the metaphysical ego which posits it, there is now added a third, the one which becomes real in the submission of the first to the second and through it: 'I am myself in this act of submitting to myself.'³⁶ Such an ego, [757] progressively realizing itself in the free and contingent submission of a first ego to a super-ego is the authentic and true ego, 'the true Being-self', as if this did not first of all have to designate the very essence of the ego and its possibility, as if this essence or any essence in general could ever realize itself progressively and be something which becomes. Because it rests ultimately on the same foundation or rather, as far as the essence of ipseity is concerned, on the same absence of foundation, the philosophy of transcendence joins classical mythology and reaches its achievement in it. By submitting itself to the law which becomes for it the law of pure reason, the ego raises itself to the latter, raises itself to itself as being free in such a way that it is henceforth impossible for it to despise itself. 'Consequently, respect is that mode of being-as-self of the ego which prevents the latter from "rejecting the hero in his soul".'³⁷ Thus a definition of the hero is substituted for the ontological determination of the essence of ipseity. Since it is not able to reveal itself as itself and in its essence, it 'reveals the ego in its "dignity" ',³⁸ and a feeble ontology once again yields to moral enthusiasm.

That the interpretation of the Being of the self, starting with the representation of the moral law, and in general starting from the essence of transcendence, should inevitably fail as does the interpretation of the essence of affectivity starting from the power of revelation peculiar to transcendence, namely, starting with transcendence itself, these confirm the problematic in its acquired results, which means that the essence of ipseity and likewise of affectivity which founds this essence and is consubstantial with it, cannot be founded on transcendence or understood starting with it but only by starting from what it really is; the essence of ipseity can be understood only as immanence. [758]

An interpretation of Heidegger's Bremen lectures: towards a dialogue with his later thought

Kōhei Mizoguchi

The positive reception of Heidegger's philosophy in Japan can be roughly divided into two types. The first focuses entirely on the earlier period of Heidegger's thought, as does the great majority of Europeans who appreciate his philosophy. The other views the later Heidegger as of extremely positive value, and tries to reinterpret his early period from this latter standpoint, as Heidegger himself does. This tendency in Japan is probably due less to a desire to follow Heidegger himself very closely than to a recognition of an affinity with Oriental thought, and especially with Zen Buddhism, in the later Heidegger. This evaluation is largely attributable to the Kyoto School established by Kitarō Nishida, who tried to universalize and rationally explain his Zen Buddhist experiences through his encounters with Western philosophy.

The European philosophy which Kitarō Nishida critically confronted and assimilated was extremely broad-ranging, but Nishida only had occasion to learn of Heidegger's early thought, and therefore he could not help but be critical of Heidegger's failure to escape from what he perceived as a subjectivistic locus.¹ This position of Nishida's was intensified by his coinage of the term 'the logic of place' in his later years, wherein he anticipates Heidegger's 'turning' (*Kehre*) and goes beyond him, reaching the standpoint of 'absolute nothingness' (which for Nishida is also absolute realism and absolute objectivism, transcending the polar opposition of subject and object). Nishida's 'absolute nothingness' goes beyond the standpoint of Hegelian abstraction (*Idee*); it is a philosophy of fundamental place, which lets things be the self-limitation of this place, and which accepts the reality of things as they are, established from that basic standpoint. According to this philosophy, the working of the self-limitation of 'place' is at the same time the self-consciousness of the historically grounded human self having a concrete physical body.

If we may be allowed a comparison, the thought of absolute nothing-

ness, as far as its form is concerned, has the character of a synthesis of the 'topological' thought of the later Heidegger and the 'existential' thought of the early Heidegger. Thus the Kyoto School, which tries to follow the tradition of Nishida, naturally esteems very highly the topological thought of Heidegger after his turning. In addition to structural similarities, of course, the existence of common terms and elements also plays an important role in making possible the dialogue between these two different traditions. But at the same time, the danger of lapsing into subjectivity (or losing our objectivity) always lurks within the posture of such a cross-philosophical dialogue. This danger increases in the philosophies of Nishida and Heidegger, which are both grounded in basic experience, and also try to go beyond the usual styles of thinking and forms of expression. To retain our objectivity, therefore, we must always be conscious of their differences. This should be a fundamental precondition of our mental attitude towards the appeal of any foreign philosophical tradition, and serve to shock us out of preconceptions which might otherwise lead us into subjectivism. With these provisos in mind, then, this essay will attempt to interpret Heidegger's Bremen lectures, *Einblick in das was ist* (1949), which both express the fruits of his middle period and serve as an approach to his later thought.

Heidegger gave four successive lectures under the above title: 'The thing' (*Das Ding*), 'The enframing' (*Das Gestell*), 'The danger' (*Die Gefahr*), and 'The turning' (*Die Kehre*). Taken as a whole, these lectures connect the shift from the 'being-historical thought' (*seinsgeschichtliches Denken*) of his middle period with the notion of 'Event' (*Ereignis*) which is central to his later thought. To put it a little differently, these lectures suggest certain relations between Heidegger's topological-transcendental side and his being-historical side, which constitute the most difficult problem in understanding both Heidegger and his appraisals by the Kyoto School. While Nishida and the later Heidegger show some similarities in their topological and transcendental standpoints, there is a discrepancy between their views on the historicity of thinking itself, most visible in their specific critical analysis of the contemporary historical world. For Heidegger, the modern technical world is analyzed and characterized concretely as the Enframing, which is a privative form of the coming-to-pass (*Geschehen*) of Being itself, and this analysis comes from his being-historical thought and his topological investigations. Nishida also treats the world as a concrete historical bodily presence. But even if he formally emphasizes the historical world, since he sees history in an abstract and formalistic view as the 'self-limitation of absolute presence', he fails to look specifically at historical periods and analyze them. The presence or absence of this critical analysis will not ultimately be due to whether they treat history as a central issue, but to how radically historically grounded they see themselves as being. I want to focus on this problem

of the historicity of thought as one of the noteworthy differences between us and Heidegger. In the following interpretation, I shall treat the problem of the historicity of thought as a problem of the relationships between event (*Ereignis*) and Enframing (*Gestell*). In particular, I shall focus on an analysis of the internal structure of Heidegger's thought, as an attempt to lay the groundwork for a concrete philosophical dialogue.

I

The overall title of the lecture series which we are considering here, *Insight Into That Which Is* (*Einblick in das was ist*), is itself significant. This title has a double meaning, which suggests the twofold nature of the lectures' contents. First of all, 'that which is' signifies the things which exist and present themselves to us. But of course it does not just refer only to the various things and events before our eyes. As Heidegger says, 'Without Being . . . all beings would remain without being'.² Thus, beings have to be seen from the perspective of Being. Moreover, we must take the relative pronoun 'which' (*was*), following Heidegger's technical vocabulary, as referring to the active expression of essence (*Wesen*). Then 'that which is' expresses the 'belonging together' (*Zusammengehörigkeit*) of Being itself and the particular things which are for us within it. 'Being could not come to presence without beings'.³ So 'Insight into that which is' implies firstly the investigation into and thinking about the coming-to-presence of Being, in terms of beings that are proximally present. Heidegger treats the primary mode of the being of beings in terms of technology (*Technik*). Enframing (*Gestell*), in turn, refers to the destiny (*Geschick*) of Being which controls in and through the form of technology. If we follow the structure of being-historical thought, then the things which are must be taken from the assembling (*versammelnde*) presence of history, and thus Enframing is understood as the ultimate completion or fulfilment of metaphysics, the collective state of Western traditional metaphysical essence. In this sense, for Heidegger, the interpretation of the present period and of historical thought becomes one. So 'Insight into that which is' is firstly an inquiry into technology, namely a philosophical investigation of the nature of technology, or Enframing.

If Heidegger's thought had stopped at the standpoint of the traditional ontological questions, *Insight Into That Which Is* might have finished with the question concerning technology. This is because ontological issues tend to take as their central theme the study of the being of beings; their enterprise begins and ends there. In fact, the system of ontological-metaphysical inquiry treats truth as fixed and static, overlooking the ever-changing reciprocity between truth and the being of the

people who are inquiring into it. As far as the being of truth is concerned, the being of the inquirer is not necessarily essential to the being of truth itself. However, for thinking which takes as its basis the dynamic reciprocity of truth and the 'historical' (*geschehende*) being of its inquirers, truth becomes something whose appearance (*Erscheinen*) is dynamically modified through that reciprocity with existence.⁴ Therefore a philosophy which looks into the essence of technology, witnesses or experiences the essential modifications of Being as it is presented to human beings, within the belonging together of human beings and Being (*Zusammengehören von Mensch und Sein*),⁵ which in other terms is the mutual reciprocity of thinking and truth. It is here that the relative pronoun 'which' (*was*) in his title takes on the secondary meanings of an active verb. The philosophy which would look into the essence of technology – that which is – by experiencing the presence of that essence, gains the possibility of witnessing a new world different from that technology. In this sense the 'that which is' (*was ist*) no longer signifies the modern technological way of being, but the coming-to-presence (*Wesen*) of the new, modified world. This modification of the world does not of course mean a change in the subjective perspective of beings. The entire mutual interrelationship between Being and beings undergoes a revolution. In my view, 'that which is' means in Heidegger 'what truly is', and this means 'what essentially is' (*was west*), and that is the essential being (*Wesen*) of another new and authentic world as Event (*Ereignis*).

It is true that at the end of his lectures, Heidegger himself views 'that which is' as the presence of Being itself.⁶ But even Being itself is not something independent of beings, but refers to the whole, including both elements in their belonging together. If that were not the case, Being itself would, Heidegger emphasizes, again become something structurally similar to a metaphysical substance. We must also interpret from this perspective his position that the thing has no special elemental status in the Fourfold (*Geviert*), when he develops the Fourfold in his lecture 'The thing'.

Heidegger takes this changing world (it is still a potential world) as the world in which things themselves each express their own peculiar characteristics (*dingen*). It is a presence (worlding) of the world itself in which the four elements of earth and heaven, mortals and divinities, are constantly and reciprocally reverting (*enteignen*), particularized into their individual being, and at the same time unified (*vereignen*) in their nature – a world of mirror-play (*Spiegel-Spiel*). He calls this world the Fourfold, and these kinds of happenings 'Event' (*Ereignis*).⁷ Thus this 'Insight into that which is' is a philosophical inquiry into things, and things as they come to express themselves as things. But if we take the modifications of this world as the movement of Being itself, then an 'Insight' (*Einblick*) does not simply mean an insight from the human side. Rather, it refers

primarily to a 'flash' (*Einblitz*) of the whole turning of affairs.⁸ Thus *Insight Into That Which Is* is also 'The turning' (*Die Kehre*).

Especially in this case, the relationships between Enframing and Fourfold are not clear and distinct, but harbor problems. While both can be seen as the presence of Being itself, Enframing should be taken primarily in terms of a refusal of the world as the neglect of the thing (*die Verweigerung von Welt als die Verwahrlosung des Dinges*).⁹ On the other hand, the Fourfold, as the preserver of Being (*Wahrnis des Seins*), is also regarded as the truth of the presence of Being (*Wahrheit des Wesens von Sein*). Fourfold and Enframing are not similar (*das Gleiche*), but are the same (*das Selbe*). Yet in another place, Heidegger calls Enframing the prelude (*Vorspiel*) of Event.¹⁰ Furthermore, the world as Fourfold is never a single mode of Being. Here, we once again confront the distinction between authenticity and inauthenticity from *Being and Time*, and the eschatological dimension of Heidegger's middle and later periods. Whether Heidegger's thought can contribute to modern philosophy depends largely on how we interpret this relation between Fourfold and Enframing.

Thus *Insight Into That Which Is* comprises first 'The enframing', then 'The thing', and then 'The turning'. What is then the relation of these to the remaining lecture, 'The danger' (*Die Gefahr*)? If we follow Heidegger, the Danger means the essence, coming-to-presence itself, of Enframing, which is the essence of technology. Heidegger tries to explain this curious relationship between the Danger and Enframing from the Old High German etymological root *fara*, which connotes both urging forward and exposing to danger. Leaving aside the accuracy of this derivation, we can explain the essence of the dominant function of the setting (*Stellen*) within 'Enframing' as urging (*Nachstellen*), and that urging as Danger (gathering of urgings). At the same time, the extremity of Danger which we feel within the word we read as 'Danger' points to a peculiar privative 'hiddenness' (*Verborgenheit*) in the nature of Being itself. The Danger also expresses the coming to presence of hiddenness which is a fundamental tendency of Being itself. 'Enframing comes to presence as Danger'.¹¹ Therefore Enframing, as the Being of beings, refers to the present unhiddenness (*Unverborgenheit*) of beings which are.

Then 'The danger' refers to the coming-to-presence of Being itself which withdraws itself by conferring Enframing, namely the experience of the coming-to-presence of Being itself in the period in which Enframing dominates. In other words, 'The danger' comes to refer to a constellation of hiddenness and unhiddenness as a whole, or the simultaneous presence of both elements. From another perspective, if we can say that Being itself can turn, then Being itself can turn in that constellation. This is the terminus of the correlative circular movement of thought and experience itself (both of which progress from technology to Enframing). It

expresses the extreme experience of Being itself, under the domination of technology. Here we have the conclusion and gathering of the workings of the being-historical thought (*seinsgeschichtliches Denken*) which Heidegger had carried out through his middle period. So 'The danger' is 'The turning' from 'The enframing' to 'The thing', and that which gives form to the point of contact of that move. The locus of this movement, which is given form and opened by the Danger, is the one and only place where we can treat the problem of the relations of Enframing and Fourfold. It is here that the experience of the domination of Enframing, as oblivion of Being, as distress, and as pain¹² (*Seinsvergessenheit*, *Not*, *Schmerz*), comes to take on a definite meaning, because this experience first proclaims the possibility of the modification of the world. Thus Heidegger's lectures on *Insight Into That Which Is* are formulated on the necessary internal relations of each lecture, and as a whole, they point to one 'occurrence' of Being – or in Heidegger's words, the Event.

Now as we noted before, these lectures occur in the order: 'The thing', 'The enframing', 'The danger', and 'The turning'. But if we follow the above interpretation, considering their internal relations, the lecture on 'The thing' ought to come last. Then why is it put first? For the time being, we can think of two reasons. One is based on the peculiarly cyclical nature of Heidegger's thought, on the insight that 'Primordial [*anfänglich*] earliness shows itself to man only at the end'.¹³ Thus the world of Event presented in 'The thing' is at once the last element and the earliest origin, and so is placed at the beginning as the origin. The second point is a problem of methodology which is essentially related to the first issue. In order to accomplish the fore-project (*Vorentwurf*) in terms of the hermeneutic circle, 'The thing' is placed first and so gives from the start to the subsequently developed thought a horizon which becomes a locus where the thought is achieved, and can later serve as a criterion. In this case, too, that which is placed first can also be placed last.

As has been often pointed out, the world of the Fourfold as Event articulated and developed in 'The thing' is a Presocratic Greek world dominated by myth (*muthos*), and is thus the oldest and earliest world. But Heidegger's philosophy does not assert simply its recurrence. If we follow being-historical thought, the oldest things endure in hidden form and are gathered even into the present age, as having been (*Gewesen*). For Heidegger, the oldest thing is at once the beginning and therefore the origin (*Anfang und Ursprung*). Those ancient origins which are now hidden are in fact the truth of Being itself. So if we want to think about the truth of Being, we first have to recollect the past (*das Gewesene*) itself. That is at the same time not only the oldest of things, but when we think about it, it must become the first thing to stand in our memories.

In other words, we have to 'pre-think' (*Vordenken*) against the arrival of the earliest origins again in the future. Heidegger writes: 'Recollecting the past is pre-thinking into that which is unthought and should be thought. Thinking is recollecting pre-thinking [*Denken ist andenkendes Vordenken*].'¹⁴ Thus the position of 'The thing' as the first lecture is most significant.

There arises here another confusing problem. Even if the world of Event is based upon the past, as long as it is pre-thought to be in the future, then it is no more than a possible world and not the real world of experience and actual occurrences. Moreover, the object of this kind of thinking has the danger of becoming merely a kind of thought-construction or idea. In one dialogue Heidegger mentions the arrival of Event as follows: 'I don't know if this will ever happen or not! But within the essence of technology, I see the first glimmer [*Vorschein*] of a much deeper mystery, of what I call the "Event"'.¹⁵ Does it suffice that we treat this as simply another case of Heidegger's often-touted prophetic personality? If we take Heidegger as being merely prophetic here, then we learn nothing from this statement, for there is no ultimate conclusion nor universal theory of Being within this view of his forward-looking thought of Event. Rather, it is precisely at this point that we find the most basic characteristic of Heidegger's perpetual inquiry into 'that which must be thought'. We may say that this is the integrity of Heidegger's thinking. Thus an interpretation which over-emphasizes the notion of Event is in danger of mistaking the basic direction of his thought. It is here that we see the decisive gap between Heidegger, who follows the process and direction of historical thought, and Nishida, who tries to draw out all reality based on a dialectical theory from absolute nothingness as the ultimate ground. Heidegger tries to ground the forward-looking character of his thought in a historical process. Therefore it is more appropriate to take his thought as the unification of the present, the future, and the past, based on the entirety of his *Insight Into That Which Is*. This entails a re-examination of the meaning of the lecture. 'The thing' in its relation to the whole, from the standpoints of the cyclical nature of his thought and the structure of the hermeneutic circle.

II

The ontological hermeneutic circle, as presented in *Being and Time*, must be taken for the basic and necessary structure of human thought of which the basis is the mutual interdependence or correlativity between historical existence itself and the object of thought.¹⁶ In the working of the hermeneutic circle, a fore-project takes over the past as legacy, and

is revised through concrete interpretation and then concretely articulated. If we apply this kind of structure to the present case, then the world of the Fourfold presented in 'The thing' covertly plays the role of fore-project for Heidegger's thought, and as a criterial horizon, through a concrete interpretation of the present world as Enframing it itself becomes concretized, resulting in a new expression of the world of Event.

The world of the Fourfold as Event is not simply a world prophetically anticipated, rather it is the criterial horizon for the ontological interpretation in a broad sense of the present technological world. This may be recognized at several points. For example, only by using the world of Event as a criterion can we perceive the deficiencies of previous Western metaphysical systems which return into Enframing: 'oblivion of Being', 'neglect of the thing', the loss of true closeness (*Nähe*) in 'uniform distance' (*das gleichförmig Abstandslose*).¹⁷

The being-historical thinking of Heidegger's middle period had continually seen that kind of negative, privative structure within the history of Western metaphysics, and thus tried to interpret and accomplish the fore-project of Event by making this Event a criterion and clue. This fore-project of Event was already made within a limited realm and covertly through Heidegger's turning. Of course this is not something concrete or thematized from the beginning; it shows its concrete form first through the process of circular practice.

Moreover, the criterial characteristics of the Fourfold go so far as to take the privative characteristics of Enframing as the coming-to-presence of Being itself. For example, this can be seen in the case of *The Question Concerning Technology* (*Die Frage nach der Technik*). In this treatise, Enframing is regarded not only as the coming-to-presence of Being itself, but also as a derivative of the producing and exhibiting (*Her- und Darstellen*) seen in the ancient Greek *technē*.¹⁸ For there is a similarity between Enframing and the revealing (*Entbergen*) as bringing-forth (*Her-vorbringen*) seen in *technē*. Thus we can interpret the present world of technology as the working of the revealing of Being. On this point as well, the world of the ancient Greeks again functions as a fore-projected criterion for drawing out an interpretation of Heidegger. But in this case, the world of the Fourfold as Event which takes ancient Greece as its model is again the recurrent conclusion reached through a hermeneutic circle. Here we have to reflect more closely on that circular structure.

The horizon of meanings (*Sinnhorizont*) which bears the role of the fore-project in the movement of the hermeneutic circle does not exist independently in itself, nor is it derived or invented purely from thought. If we follow the thought of the earlier Heidegger and of other hermeneutic philosophies, the horizon of meanings originates and is derived dialogically from the past as history which already forms its present basis.¹⁹ In this regard, insofar as Heidegger tries to take over the ancient Greek

experience of Being as the true past, that Greek experience becomes the criterion and the fore-project underlying all interpretation of Being. But the situation is not so simple when the problem concerns the ontological horizon of meanings itself, since the ontological horizon of meanings has already been transmitted in some form or another from the past, before meeting with the past clearly and thematically. Gadamer calls this transmitted horizon of meanings 'prejudice' (*Vormeinung*).²⁰ Here the horizon of meanings itself as prejudice is already a historical past condition, upon which the thematic engagement with the past can for the first time take place, and based on which dialogical circle a modified horizon of meanings becomes possible. The immediate past horizon of meanings, as 'prejudice', is the primarily transmitted horizon of meanings of the present period, but it is not necessarily either self-conscious nor are its origins clearly discerned. Rather, it is because those origins are unknown that that prejudice wields its power.

But when Heidegger started down the road towards the question of Being in *Being and Time*, the first problem he encountered, in trying to clarify its meaning and origins, was the ontological horizon of meanings as just this prejudice. He did not start his analysis from the authenticity of Dasein, but rather from 'everydayness'. This shows that he took the prevalent prejudice for the fundamental reality, and therefore for the basic issue. Now if we want to look at prejudice for what it is, and treat it as a new problem of its own, then we need a new horizon that is not under the sway of prejudice. Again following the ideas of hermeneutic philosophy, that new horizon must be formed out of the dialogical interaction of prejudice and tradition. In Heidegger's case, the formation of a new horizon of meanings whereby to take prejudice for itself does not come immediately out of the encounter with the tradition of ancient Greece. Ever since *Being and Time*, the early Greek experiences of Being were a leading thread to which Heidegger continually referred.

This is not to say that the form and expression of ancient Greek experience directly guided all the concepts and analysis of *Being and Time*. Rather, what first contributed to forming the horizon of prejudice was traditional Western metaphysics, which he later was to characterize as privation – especially the philosophy of the eighteenth century onwards – which had already confronted and criticized such traditional metaphysics from a limited realm. (We may consider, among others, the names of Kant, Hegel, Nietzsche, Dilthey, and Husserl in particular.) But it is Heidegger's horizon that becomes a problem again in terms of its prejudices; it is here that the clear and dialogical encounter with ancient Greece first takes place. Thereafter, within this encounter, prevalent prejudice and traditional Western metaphysics, which help form the horizon by which that powerful Greek tradition is interpreted, become a single great historical prejudice.

What does all of this clarify? First, insofar as we continue to have a limited perspective on the structure of the hermeneutic circle, then the new horizon formed from Heidegger's central encounter with ancient Greece must be formed from a dialogical encounter between Greece and the (later Western) metaphysical tradition as the prevalent prejudice. So of course we cannot call this new horizon objectively and historically equivalent to the ancient Greek experience of Being. Heidegger himself achieves 'the effort to think through original thinking more originally',²¹ and recognizes this point when he calls that which must come 'the other beginning' (*der andere Anfang*). Secondly, the newly-formed horizon becomes a criterial horizon for the interpretation of both ancient Greek experience and the traditional and currently predominant interpretations of Being; but insofar as this new horizon is formed from a kind of fusion in the encounter with these two traditions, we cannot imagine that either will be completely adequate for a self-interpretation of this new horizon as a whole.

To put it a little differently, it is not the case that of the two – the ancient Greek experience and the predominant modern interpretations of Being – one would become a standard of truth, and the other merely a derivative. So, we cannot take the Fourfold of ancient Greek experience presented in 'The thing' as referring simply either to Heidegger's 'protection of the truth of Being', nor to a unique form of the coming-to-presence of the world itself (worlding), nor to the expression of that which is awaited in the future. Rather, the fore-projected horizon leading Heidegger is not yet adequately and concretely articulated. So the world of the Fourfold as Event presented in 'The thing', even if it appears to take the final form of a fore-project itself, in the movement of the hermeneutic circle, is nevertheless in its basic nature something different. Nor can we say that the world of the Fourfold is a criterion by which the Enframing comes to be interpreted. As Heidegger tried to express their relations above, both are identical in their revealing (*Entbergen*), and with respect to the coming-to-presence of Being, not equivalent but the same. At the same time, Enframing is the privation of the Fourfold, and the 'luminescence of things to come'. But these complicated expressions show us rather that their relations are not yet adequately experienced or understood. Heidegger could not achieve a dialogue synthetically fusing the classical Greek experience of Being and the traditional Western metaphysics which presently wields power in our prejudices; he was not able adequately to structure a horizon of meanings fusing the two. If that were possible, then from the viewpoint of the Fourfold, Enframing would be something other than mere privation; it would be given a concrete basis. Similarly, the world of the Fourfold would be locatable within the united whole of the present Enframing

and the Fourfold and not need to be based in some future state separate from the present.

If we can make the comparison here, Nishida's standpoint of 'absolute nothingness' tries to combine at one stroke both authenticity and inauthenticity, by locating it in the self-development of the dialectical self-determination of absolute nothingness. While this move of Nishida's philosophy bypasses metaphysics in its traditional sense, by grounding everything at once in absolute nothingness, it retains the metaphysical character of affirming everything in its hierarchic order of Being. Conversely, everything is ultimately reduced to the absolute presence of absolute nothingness, by which it takes on a trans-historical position. Certainly Nishida himself thinks of the historical world as 'the self-determination of the absolute present', and 'immanence as transcendence'.²² But the specific historical contents of that self-determination are the focus of the world and neglected within 'unlimited creativity'. Even if the philosophy of absolute nothingness talks about historical determination, it fails to look at itself within that context. The world of technology which appears privative to Heidegger is indiscriminately given a positive valuation as the active intuition of absolute nothingness in Nishida's philosophy.²³

By contrast, because he wants to ground his thought in history and to avoid placing the authentic Event within a transcendently absolute present, Heidegger tries to base his thought on the historical future. We do not have time to examine the implications of these differences here, but if we limit ourselves to Heidegger's side, we might make the following conjectures. The fore-project guiding Heidegger's thought may best be sought within the 'and' linking Enframing and the Fourfold – and the domain opened up through their relationship might provide for the first time a criterion for interpretation. It is perhaps this question which covertly guided Heidegger's thinking on this issue.

Contrary to our original intentions, we have here abandoned the standpoint of looking at *Insight Into That Which Is* as a complete movement of the hermeneutic circle for which 'The thing' is both fore-project and result. The lectures in their entirety constitute an attempt at a dialogue between current prejudices and ancient Greek experience, in the progressive pursuit of the formulation of a new horizon of Being. From this perspective, 'The danger' and 'The turning' express the hidden points of contact in the dialogue between 'The thing' and 'The enframing'. This also sheds light on the role and position of the world of the Fourfold as Event, which are full of mysteries uninterpretable at a glance. Heidegger's pre-thinking is not towards the world of the Fourfold, but rather towards the unifying and fusing dialogue of Greek and modern thought hinted at in the 'and' linking the Fourfold and Enframing.

Based on this understanding of the internal relations and the overall

meaning of these complicated lectures, we can gain a better perspective on our own activities of interpretation. There has been hardly any work done on the internal criticism of Heidegger's idea of Event, which is central to his later thinking, nor of his lectures on *Insight Into That Which Is* taken together – except for the work of Otto Pöggeler. This may be partly due to the fact that these lectures were not published as a whole, but more importantly to the fact that his thinking about Event takes a form which hardly admits of any criticism. That difficulty of criticism rests rather in our own tendency to view Heidegger's thought on Event as his ultimate teaching. If so, then the way to the idea of Event is closed to us, insofar as any approaches to Event are not indicated by Heidegger except through the 'Turning of Being' and the 'Leap' (*Sprung*). For by what kinds of criteria, in what way can we criticize a philosophy of something we have never even approached, much less experienced?

At this point, we can simply point out certain questions which arise. If the thought of Event originates in the dialogue with Greek philosophy and takes ancient Greece as its model, is it not always something progressively self-determined, and not the ultimate conclusion of Heidegger's philosophy, nor adequate to express the entire domain of his problem? If this question is appropriate, then it gives us another chance and indeed a sounder ground upon which critically to re-examine the dialogue which Heidegger is conducting. Such a critical re-examination would start, not from a one-sided use of ancient Greece as a criterion, but from the possibility of the fusion of the Greek experience with the present horizon of meanings. Then we come to wonder whether it is necessary for the present horizon of meanings to include a dialogue with ancient Greece – or, to put it differently, whether the 'dialogue with ancient Greece' itself is not already one of Heidegger's prejudices, which needs to be reconsidered. The possibility of this criticism in turn prepares the way for the dialogue with Nishida's philosophy.

The end of philosophy as the beginning of thinking

Samuel IJsseling

In the middle of the sixties, Heidegger wrote a few texts which take the end of philosophy as their express theme.¹ They can be read as the development of earlier texts which deal with the overcoming of metaphysics and in a broader context they can be understood as a development and radicalization of what in *Being and Time* and in the 'Marburg Lectures' was still characterized as the destruction of traditional ontology. What is at issue in this discussion of the end of philosophy, Heidegger tells us, is 'the attempt, repeatedly undertaken since 1930, to reformulate the questions of *Being and Time* in a more original way'.² The carrying through of the destruction of the ontological tradition in which, according to *Being and Time*, 'the question of being first achieves its true concreteness', belongs essentially to this posing of the question.³

The frame of reference into which Heidegger fits the problem of the end of philosophy, generates, on the one hand, a thinking exchange or dialogue with Hegel and, up to a certain point, also with Husserl and Nietzsche; on the other hand, it gives rise to reflection on, or an entry into, the essence of technology and modern science and, before all else, of computer science. The opposition Heidegger establishes between philosophy and thinking also belongs within this frame of reference. And finally, there belongs within this framework the attempt to achieve 'a determination of the matter of thinking'. And – as we hope to show – *one* aspect at least of this matter of thinking is, for Heidegger, what remains concealed in the end of philosophy, that is, what really happens when philosophy comes to an end. It belongs to the matter of thinking to ponder what is peculiar to the end. We want to try and throw some light on these three points.

In the frame of reference in which Heidegger poses the problem of the end of philosophy, there belongs, in the first place, the thinking exchange, or the dialogue with Hegel. What is astonishing is not, as Heidegger notes in *The Fundamental Problems of Phenomenology*, that

philosophy is, 'in a certain sense, thought to an end by Hegel';⁴ and that the theme of the end of philosophy is expressly raised. In the Preface to the *Phenomenology of Spirit*, Hegel sets himself the task of 'bringing philosophy nearer to the form of science – that goal whereby it can lay aside the name of love of knowledge and be actual knowledge'.⁵ In actual or absolute knowledge philosophy arrives at its completion. According to Heidegger, this completion is the radicalization and realization of the whole original project of philosophy since the Greeks, and in particular of the Cartesian philosophy. Theme and method have become one and the same, and in absolute knowledge the being of beings as presencing has, in the form of substantiality and subjectivity, reached the fully developed certainty of self-knowing knowledge. According to Heidegger, there is a tendency to suppose that philosophy has achieved its highest perfection here at its end. Heidegger is of the opinion however, that it is not possible to talk of perfection. He writes:

Not only do we lack any criterion which would permit us to evaluate the perfection of one epoch of metaphysics as compared with any other epoch. The right to this kind of evaluation does not exist. Plato's thinking is no more perfect than Parmenides'. Hegel's philosophy is no more perfect than Kant's. Each epoch has its own necessity. We simply have to acknowledge the fact that a philosophy is the way it is.⁶

For Heidegger, completion of philosophy does not mean perfection but rather 'being gathered in its most extreme possibility'.⁷ It may be noted here that in *Being and Time* the 'most extreme possibility' of Dasein is death and that it gives expression to the finitude of Dasein. If Heidegger talks about the completion of philosophy as 'being gathering in its most extreme possibility' the finitude of philosophy is also announced therewith.

A thinking conversation with Hegel oriented around what is peculiar to the end of philosophy is not a matter of criticizing Hegel, or even of contradicting him. In the essay 'Who is Nietzsche's Zarathustra?' Heidegger says: 'The business of mounting refutations never succeeds in getting on the path of thinking. It belongs to that smallness of spirit whose expression is required for the maintenance of publicity'.⁸ And a few pages earlier he says: 'The unique thing that thinking is capable of saying can be neither logically nor empirically proved or disproved'.⁹ It is a matter not of mounting refutations but of a 'dialogue', as Heidegger calls it in the appendix to the Nietzsche volume in the *Gesamtausgabe*.¹⁰ There he tells us that this dialogue is not a fault-finding or an underlining of failures. It is the establishment of limits, not with a view to denying the latter as limiting or to doing better or trying to show that one has done

better. The limits belong to its greatness. The limits of anything great are the margins of what is other and created. These limits are constitutive for philosophy and belong to the finitude of philosophical thinking. This finitude – again itself an aspect of the end of philosophy – is not based solely, or in the first instance, upon the limitedness of human faculties but upon the finitude of the matter of thinking or upon the finitude of being itself.¹¹

In this connection Heidegger speaks of the unthought, of the unthought *in* thinking. Here too the 'reference to the unthought in philosophy is not a criticism of philosophy'.¹² The unthought is not a lack but belongs essentially to philosophy. In *What is Called Thinking?* Heidegger writes: 'The more original a thinking is, the richer will its unthought be. The unthought is the most precious gift that a thinking has to convey'.¹³ And in *The Principle of Reason* he writes:

The greater the work of a thinker, the richer is what is unthought in this work, that is to say, what initially and exclusively through this work emerges as having not yet been thought. Of course, this unthought has nothing to do with what a thinker might have overlooked or not mastered and which his more knowledgeable successors have to make good on.¹⁴

The unthought increases, so to speak, to the extent that more is thought. For this very reason, according to Heidegger, the unthought is greatest with Hegel, who thought everything that could only be thought. In my opinion, a reading of Heidegger is not possible in which this unthought does not in any way possess a positive content. It is true that with Heidegger the unthought is sometimes ambiguous and there are texts which convey the impression that it is something positive. In any case, it is never what in the metaphysical tradition is called the *ineffable* or what surpasses our thinking. It is rather what reveals itself in anxiety, in the depths of boredom, or at and in the end of philosophy. This becomes still clearer with Heidegger's deliberations about the essence of technology and modern science.

The end of philosophy manifests itself most evidently in modern technology or, as Heidegger expresses it,

as the triumph of the controllable institution of a technologically scientific world and the social order which corresponds to this world. The end of philosophy means: the beginning of that world civilization which is founded in Western European thinking.¹⁵

The end of philosophy is therewith now understood as the *resolution* of philosophy into technical science. In a certain sense, a first step towards

this resolution is the *release* of the sciences from philosophy and the institution of their independence.¹⁶ A technologically scientific interpretation of thinking is bound up with this. Thinking becomes philosophical and the latter is conceived and developed in a technologically scientific fashion. This already comes to light in the Greek era as a decisive trait, as a direction. Many other steps are important in this development, as, for example, the translation of Greek thought into Roman, which is imperialistic and has the character of power-oriented knowledge – truth is what holds out and possesses power – and further on, the translation of Roman into the Roman-Christian, in which the being of beings is understood as brought into being in the sense of creation. A decisive step is the formulation of ‘The principle of sufficient reason’ with Leibniz, which latter required a long ‘incubation period’, as Heidegger tells us, but which was already announced in certain features of the entire metaphysical tradition. From now on, everything is in principle susceptible to calculation and control, planning and mastery. *At the End* now means this, that being is no longer understood as subject or object, as was the case with Descartes, Hegel and Husserl, but as disposable reserve. The so-called subject–object schema as the basis for an explanation of all appearances loses its significance. Industrial society is, as Heidegger tells us, neither subject nor object,¹⁷ and what is known as the enframing (*Gestell*) no longer belongs within the horizon of representation, and so remains foreign to traditional thinking. Today’s world is guided by technological science in which truth is equated with efficiency and in which, through such cybernetic key-words as information, regulation and feed-back, primary concepts such as ground and consequence, cause and effect, subject and object, theory and practice, concepts which played a leading role in science hitherto are transformed in an almost uncanny manner. A new basic attitude comes into being, a new relationship, and the key word for this basic attitude is *Information*, whereby Heidegger remarks somewhat cynically that we have to hear the word in its American-English accent.¹⁸ This information, as for example the data stored up in DNA which determines the manner in which the organism develops, can be understood neither as subject nor consciousness nor as object nor matter. It is neither the same, as was the Platonic εἶδος nor the Aristotelian μορφή nor *forma*. All of our philosophical categories have lost their meaning. It is a monstrous, uncanny possibility, a ‘most extreme possibility’, that all philosophical concepts have become meaningless. This possibility belongs to the essence of the end of philosophy.

To reject or to criticize Hegel is as unimportant for Heidegger as it is to pass judgment upon technology or the entire development which has led to it, although Heidegger is sometimes the victim of his own rhetoric. He writes in *Identity and Difference*: ‘To be sure, we cannot repudiate the technological world of today as the work of the devil nor should we

destroy it, assuming that it does not do this to itself.¹⁹ There is no evil genius of technology but only the secret of its essence. This essence is being itself²⁰ which, to a very large extent, remains ambiguous. It is, so to speak, that which makes possible and permits the appearance of what we today call reality, but it also conceals within itself the most extreme danger. We cannot destroy technology or overcome it, let alone reverse it, but it can destroy itself, either through a nuclear war or through the total destruction of the environment, as Heidegger wrote in 1950. It can also bring with it the needlessness of that complete thoughtlessness which Heidegger takes to be much more dangerous. Technology and science would then lose their meaning. Here we run up against that most extreme limit which can no longer be thought.

Technologized science is that into which philosophy is resolved, and according to Heidegger, that is a *legitimate advance*.²¹ At the end of philosophy, that direction which philosophical thought has been pursuing in the course of its history from the very beginning makes itself known.²² This history is the history of being itself and, in a certain sense, it is the technicians who are most true to this history and who follow its direction most faithfully, although Heidegger never formulated it quite so explicitly. In this history or in the coming-to-its-end of philosophy something still remains hidden: a task of thought. This task consists, in the first place, in *pondering* what really comes to pass at this end. To ponder this belongs to the matter of thinking.

In connection with this entire problematic, the opposition Heidegger draws between philosophy and thinking plays a large role. And here it should be noted that Heidegger often uses the word thinking for philosophy and the word philosophy for what he understands by thinking. Moreover, it is not a matter of an absolute opposition. On the one hand, there remains in philosophy something which is still *always* kept from thinking and, on the other, thinking can probably never occur entirely without philosophy.

Philosophy is for Heidegger metaphysics, or, in the end, ontology. And this then possesses an onto-theological constitution. Metaphysical thinking is an explanatory and a grounding thinking. It inquires into causes and grounds, into motives, conditions of the possibility and it never rests content with the thing itself because it is always looking for something else behind the thing, a more original thing. It is – especially since Descartes – a representational thinking which, because it always understands its subject matter as that of a representing subject or as represented object, is even less capable of sticking with it. It may also assume the form of a reasoning process, a logical progression that also keeps on going right past the subject. Metaphysical thinking can, in addition, take on the form of a conceptualization which seeks to see everything in one large connection or in a unity and which is character-

ized by a making-own (*sich-eigen-machen*) or appropriation (*Aneignung*) or by interiorization. This conceptualization – a word that Heidegger otherwise seldom employs – is directed to the freeing of everything from its alienness, its strangeness and to taking it up into itself as being-with-itself. It is domestication. Philosophy is, above all since Descartes, a seeking after security, after certainty, a safe-keeping. Truth then becomes the complete certainty of self-knowing knowledge. This understanding of truth is characteristic of modern times and so it is also not accidental that modern philosophy begins with doubt and no longer with wonder and moreover with a view to transforming this doubt into certainty as soon as possible. One form of metaphysics at the end is calculative thinking, which has been especially successful since Leibniz and which claims sovereignty over everything, computes everything and takes account of everything. This thinking can, according to Heidegger, proceed better and much more quickly through thinking machines, computers which in one second flawlessly calculate thousands of relationships. In connection with such a thinking, human being is an inconvenience. At the end, or with the completion of philosophy, this thinking will simply become data storage and data processing. At that point, traditional metaphysical concepts have lost their meaning.

This metaphysical thinking with its – according to Heidegger – secretive history and development makes it possible for modern man to master and control everything. At the same time, this very man is mastered and bewitched by this thinking and it is precisely this that slips out of his command and control in an almost uncanny fashion. That means that in this thinking something still lies concealed which remains alien to it, something to which the thinking in question has no access and which escapes it. In other words, metaphysical thinking is enveloped by a limit, by a margin which makes this thinking possible, which limits it and determines it and, at the same time, also continually threatens it.

To metaphysical thinking, Heidegger counterposes another kind of thinking which he calls recollective (*andenkende*) thinking. Under Hölderlin's influence, it is also associated with celebrating, greeting, remembering, thanking. It is an abiding-with, a wonderful tarrying, a holding out, an ability to wait – indeed for a lifetime – a stepping back, an abode. It reminds us perhaps of Far Eastern wisdom which was not alien to Heidegger or of a probing of reality of the kind to be found in Paul Klee, a man who astonished Heidegger and whose theoretical and pedagogical writings the latter perused thoroughly. In my opinion, it can also be understood as the realization and the radicalization of the original idea of phenomenology. Thinking as the enduring of being, as an abiding with beings in their being, an abiding with thinking and precisely in view of the fact that we really do think in this way and finally, as an abiding

with what determines our thinking, what calls us to think, what commands our thinking and so points the way.

One question which keeps on arising is: is such a thinking (still) possible? Does it not once again and necessarily amount to a metaphysico-technical thinking? If we are dominated by metaphysico-technical thinking and, in the end, are solely directed by the key concepts of computer science, is another kind of thinking then still possible? One should not underestimate this difficulty and Heidegger is himself fully aware of the seriousness of this problem. He will contend that this other thinking can *only* be prepared, that it is essentially, and indeed remains, untimely and can *always* only be a task. It requires quite specific strategies to guard it and to protect it against the danger which threatens it to an ever-increasing degree from the side of the sciences and their cybernetic organization within a self-regulating world civilization. Heidegger knows that this other thinking can never be a purely university or academic affair because these organizations, with their indigenous research operations, their conferences and their literary directives are carried along by the metaphysico-technical thinking and themselves belong to world civilization. Still less can it subsist outside of a particular historical, technico-economic, politico-scientific, institutional and linguistic frame of reference. For this reason, the greatest possible care has to be taken to prevent it from being the victim of the attempt to interpret it and to integrate it within the existing frame of reference. Much of Heidegger's rhetoric must be viewed in this light.

Heidegger's strategy – if one may use this word for his path of thought – is a matter of transgressing the limit, a transgression which, in general, is immediately reprovved or neutralized by the dominant thinking. A transgression with respect to which a limit, an end, must first be established and with respect to which, finally, a question has to be asked with regard to the determination of this limit, this end. For Heidegger, a limit is never the place where something comes to an end but, on the contrary, where it begins. A limit is constitutive for what is. The establishment of a limit, its transgression and the question concerning the determination of the limit, belong to the problematic of the end of philosophy. The question concerning the essence of the limit of thinking or concerning the finitude of all thinking is the question concerning the determination of the matter of thinking which – according to Heidegger – is itself finite and whose finitude is much more difficult to experience than the previous positing of an absolute.²³

Heidegger employs many and various names to describe the matter of thinking, as for example, being itself, the event of appropriation (*Ereignis*), ἀληθεία, distinction, clearing, difference as difference, decision and many, many others. All these names and their multiplicity have in turn a strategic significance, that is, they refer not to a positive content but

simply point in a specific direction. They incline the glance. They are *pointers* (*Winke*) or *paths* (*Wege*).

Here, it might be thought that one runs up against a transposition into another language, and into another frame of reference of what, in the Marburg lectures, Heidegger still called the 'phenomenological reduction'. There he distinguishes it markedly from that of Husserl. Whereas for Husserl the phenomenological reduction is a method for leading the phenomenological viewpoint from the natural attitude of human being living in the world of things and persons back to transcendental consciousness and its noetico-noematic experiences (experiences in which the object is constituted as a correlate of consciousness), for Heidegger, the phenomenological reduction leads the phenomenological viewpoint back from the always *determined* conception of beings to the understanding of the being of these beings.²⁴ Whereas for Husserl the wonder of wonders is transcendental subjectivity, a subjectivity 'beyond which it is pointless to question back', and which proves to be 'the one and only absolute being',²⁵ for Heidegger, the *wonder of all wonders*, as one can read in the Postface to *What is Metaphysics?* is 'that entities exist'.

The reduction or the leading back becomes, in the later Heidegger, *way*, or better ways. In the multiplicity and the character of these ways lies the 'step back'. Way and 'step back' cannot be understood here as a method, because the concept of method belongs within the realm of metaphysico-technical thinking. The becoming-a-method of the way – a process which, in the epoch of the completion of thinking, is, in a certain sense, brought to a close in the conclusion of Hegel's *Science of Logic* – is constitutive for metaphysics and for the end of philosophy.²⁶ Way and 'step back' mean here not an isolated movement of thought but the way in which the movement of thought takes place, and a long way which demands a duration and endurance whose scale we cannot know.²⁷

The 'step back' moves out of metaphysics into the essence of metaphysics and is, from the standpoint of the present and the insight one has into it, the step out of technology into that *essence* of modern technology which can now be thought for the first time.²⁸ Metaphysics and, at its end, technology constitute a determinate conception of beings or a determinate way of dealing with things and with human beings. The *essence* of metaphysics or technology – Heidegger calls it what is 'to be thought' – is being itself and points in the direction of ἀλήθεια, of clearing, of difference, etc. Ἀρχή or ἄρχειν, that is, the mastery of metaphysics or technology is what makes possible, determines and limits metaphysics and technology. It is, as it is called in *What is Metaphysics?* the *ground* of metaphysics and technology. At that time, step back still meant 'regression into the ground of metaphysics' – in the words of the title of the Introduction, subsequently added. Later, the word *ground*

becomes problematic, because it still belongs to metaphysical thinking, just as does the word being.

The *essence* of metaphysics is probably also the *end* of metaphysics as what is to be thought, and end is here to be understood in a spatio-temporal sense. In *Identity and Difference*, where the problematic of the 'step back' is extensively handled, Heidegger says that with the step back it is a matter of a step out of the already thought into an unthought from which the thought receives its *essential space* (*Wesensraum*).²⁹ Heidegger frequently thinks the essence and the end of metaphysics in terms of the categories space, spatiality, place, limit. Clearing too, the free openness, is supposedly that in which pure space and everything in it which is present and absent receives its all-gathering and preserving place.³⁰ Space, place and end belong together.

Heidegger writes: 'With the step back philosophy is neither abandoned nor does it disappear into a memorial for thinking human being.'³¹ The step back out of metaphysics into its essence does not mean that the discipline gets thrown out of the cultural circuit of philosophical 'formation'. It is much more a matter of the attempt to make of philosophy an 'over against' with respect to itself, a *factum*, a work, a work of language – I would like to say here: as text, and text must here be regarded as an abode, as a place or a *there* where being occurs as discovering and covering up, as revealing and concealing (both necessarily *and* accidentally). The step back out of metaphysics can for this reason only be carried through as an analysis of metaphysics, as an analysis of technology. And this analysis can only be endless because it is directed towards and upon an unthought which essentially remains unthought and which becomes more extensive to the extent that more is thought and thought in a more original manner. Most of Heidegger's texts after *Being and Time* consist in endless analyses of great texts out of the history of philosophy, analyses whose goal is not to say better what was said there, to criticize, and still less to refute them but rather to get on the track of what *happens* in these texts.

When one tries with Heidegger to approach philosophy as a work, as a work of language, one must avoid at least three things; first, this work should not, and cannot be regarded as the pure product of humankind. That would be a form of subjectivism, whereas the philosopher tries to say what is given to him to say and tries to show what shows itself from itself. Second, the work of philosophy should not, and can not be regarded as a more or less adequate reproduction or presentation of a reality given from outside philosophy. To conceive of truth as adequation may well be correct but belongs to the finite sphere of metaphysics and never succeeds in seeing what is accomplished along the way in philosophy as a work. Third, the words and sentences out of which the work is constructed cannot be viewed as signs or a complex of signs, which is

supposed to indicate a reality given outside the work. 'The essence of speech is not determined out of the sign-character of words', Heidegger writes in *What is Called Thinking?*³² '*Saying is showing.*' Indeed, Heidegger claims that the moment in which the word's *showing* became a signifying was one of the most important moments in the history of truth, of the understanding of truth as adequation and of the understanding of being as present at hand or 'continual presence'. In 'The origin of the work of art' we read:

Where no language prevails . . . there is also no openness of beings and also, accordingly, no openness to what is not and to emptiness. In as much as language first names beings, such naming first articulates beings and makes beings appear. This naming first nominates the entity in its being and out of its being.³³

And another passage. 'Through the word, in language, things first are and become what they are.'³⁴ 'Language first grants the very possibility of standing in the midst of the openness of beings.'³⁵ And 'if our essence did not take up its stand in the power of language, the totality of beings would remain closed to us, the entities which we are ourselves no less than the entities which we ourselves are not'.³⁶ What is said here about language is especially valid for the language of the thinker and for that linguistic work which is philosophy.

Philosophy as a work can be understood neither as a human product nor as a more or less adequate reproduction of a reality present at hand nor as a constellation of signs. More positively expressed, it can be said that every great philosophy is a building, a construction. As a construction, it is not an image or a representation of the world. Rather, it institutes or grounds a world. The building of philosophy stands there as the temple at Paestum stands there and, in this standing there, it opens up a world, confers a visage upon humans and Gods and makes things visible. Philosophy is a finite and limited place where reality is revealed and, at the same time, concealed. On the basis of this revealing and concealing, there arises something like what we call a world. The building that philosophy is cannot subsist without human beings but, for all that, it does not find its origin in human beings. The construction of a philosophy is, before all else, a matter of receiving and remaining open, hearing and listening. In a certain sense, philosophy constitutes itself. It is not however a *creatio ex nihilo* but is necessarily put together out of pre-given material. This material is not, as in architecture or painting, made up of stones or of colours but, as in poetry, of *words*. The fragments and sections which are taken over from, and have to be taken over from, already existing philosophical texts also belong to that material out of which a philosophy is built. Not one work, not one text

stems completely from itself. Rather, it continually refers to other texts to which it is related. A text is always taken up in a context of meaning or a referential totality. The network of references to other works is a condition of the possibility for the emergence and the understanding of a work. At the same time, it also creates the greatest obstacle for this emergence and this understanding, and it establishes its confines. As Heidegger writes: 'Modern thinking is in its basic traits much less accessible than Greek thinking, for the writing and works of the modern thinker are built differently, more intricate, intermingled with tradition and everywhere inserted into Christianity.'³⁷ On the basis of this 'developed state of affairs', philosophy runs the danger of deteriorating into 'groundless chatter' and becoming totally incomprehensible, and that means that instead of *uncovering*, it *covers up*. This danger, or so says Heidegger, is inherent in the language by which philosophy is guided. Language is – according to a famous text from Hölderlin which Heidegger is happy to cite – 'the most dangerous of the goods given to human being'. In Heidegger's opinion, it is the danger of dangers and indeed for several reasons. First, because 'the greatest good fortune of the first, instituting speech is at the same time the deepest pain of loss'.³⁸ Second, because any, even the purest, the most original and the deepest forms of expression can be taken up into a readily accessible way of talking. Words get used, used up in being used, and indeed necessarily so. And third: in the course of reproducing, of repeating, it is never established whether the original words still put into effect what they were formerly able to effect. This belongs to that which Heidegger calls the 'dis-essence [*Un-wesen*] of language' and, as he expressly remarks, it can never be avoided.³⁹

Because philosophy is a construction it can also be subject to a *destruction*, or perhaps better, a de-construction. This leads us to the question concerning the relationship between the end of philosophy and what, in the Marburg period, was called the destruction of traditional ontology. Heidegger has frequently repeated that this destruction will not bury the past in oblivion and that it is not a negation or condemnation of the past to oblivion. It is a critical taking apart of concepts which were handed down and, in the first instance, necessarily applied and, at the same time, it is a regression to the sources from which they were drawn.⁴⁰ In *Being and Time* Heidegger speaks about an investigative exposition of the 'birth certificates' of ontological concepts and he says:

But this destruction is just as far from having the *negative* sense of shaking off the ontological tradition. We must, on the contrary, stake out the positive possibilities of that tradition, and this must always mean keeping it within its limits.⁴¹

It is clear that this destruction can only be carried through as an analysis of the factically present ontology. It runs parallel with the analytic of Dasein which belongs, together with the destruction, to the dual task of *Being and Time*. Dasein's analysis and destruction are two sides of fundamental ontology or the question of being.

The most important, though often overlooked, feature of the destruction is that it is guided by the question: what does really happen in the history of philosophy? What happens when a philosophy constitutes itself as a specific philosophy? The answer to this question runs: being itself happens, ἀληθεύειν as uncovering and covering up, clearing, etc. but that brings with it in the first place ever new questions. More concretely: at the end of his Kant book Heidegger writes with reference to his interpretation of Kant: 'Don't ask what Kant says but what *happens* in his laying of the foundation of metaphysics. The interpretation of the *Critique of Pure Reason* carried out above is aimed solely at the laying bare of this *happening*.'⁴² He says much the same thing with regard to his interpretation of Schelling and Hegel, of Leibniz and Descartes. More generally expressed: Heidegger poses questions like *What is Metaphysics?* and *What is Philosophy?* Here, the *is* must be understood transitively, as he himself remarks.⁴³ That means: what allows the, or a, philosophy to be what it is and to be as it is? Or *What is meant by Thinking?* whereby 'means' is meant something like require, evoke, call into existence, orient, etc. Or again: 'Regression to the ground of metaphysics' and return to the source. These questions question into the *matter of thinking*. And precisely the same problematic, though now thought out in a more original fashion, comes back again in the question concerning the end of philosophy. What happens when philosophy comes to an end, is gathered up in its most extreme possibility? The answer to this question runs again: being itself, here thought as withdrawal, expropriation. In this sense, the problematic of the end of philosophy is the same as that of the destruction of ontology. But there are differences. There is a tendency to see the difference in the fact that, for philosophers, destruction was still a task and that philosophy in the end destroys itself. It is true that the role and responsibility of the thinker in *Being and Time* are greater than with the later Heidegger. But if one formulates the problem in this fashion, one only too readily assumes that the destruction and the end of philosophy are an annihilation. More important is perhaps the fact that the destruction is directed towards reaching an *original level*, a ground in which philosophical concepts are rooted and grounded or a source from which they were drawn, whereas that cannot be the case with the end of philosophy. Still, one has to proceed carefully with words like origin, ground or source in connection with *Being and Time* – in any case, this is my view, though such an interpretation is perhaps disputable. Indeed, the original has always already been lost and refers

in the last instance to a past which never was present. In other words, the origin, the ground or the source is, according to *Being and Time*, Dasein itself, which is essentially finite, never in possession of its self and never really with its self. Besides, the question of *Being and Time* is how something like Dasein is possible. Dasein is the being that is *there*. On the other hand, the question concerning the end of philosophy is also directed towards something more original, towards what makes this end possible. Even here the question runs: what is the end of philosophy?

To conclude, I would like to come back once again to the Heidegger-Hegel relationship in connection with the problematic of the end of philosophy. In the end, one can pose the question whether Heidegger's thinking is an inverted Hegelianism. This is a severe reproach, and all the more so since Heidegger somewhat cynically remarks that 'since Hegel's death everything has simply become a movement in reverse'.⁴⁴ And he specifically wants to get away from this movement. Heidegger: an inverted Hegelianism? Even Derrida hinted at this years ago when he posed the question of whether Heidegger's thinking might not constitute the deepest and most powerful defence of what he sought to bring to discussion under the title 'philosophy of presence'.⁴⁵ Derrida would no longer express himself in this way but the problem remains. Heidegger's thinking – a Hegelianism because he followed Hegel in still trying to think what Hegel's thinking actually makes possible, namely, what it means to say that philosophy reaches its completion in technology and what lies hidden in this end. An inverted Hegelianism, because Heidegger always starts out from history, with the supposition – in opposition to Hegel – that the commencement is what is most strange and powerful, and that what comes thereafter is not a development but a levelling down in the form of simple diffusion, a not being able to remain within the commencement in which philosophy does not proceed toward absolute knowledge but much rather towards technology, a technology which neither understands itself nor masters itself nor calls itself into question nor is even able to call itself into question. It is not difficult to cite texts from Heidegger which say this kind of thing. Everything depends on the question of what Heidegger means by *end* and by *commencement*.

Commencement (*Anfang*) is clearly distinguished by Heidegger from beginning (*Beginn*). One can say that philosophy begins with the Greeks and that calculative thinking begins with Leibniz. This beginning lies behind us. The commencement however lies before us precisely as the to-be-thought and the unthought. It is not a matter however of an unthought which can be thought. It is far more of a *limit* and in this sense also an *end*; a limit which makes thinking possible in limiting. This limit cannot be thought in the sense of an appropriation. But if one pays

attention to precisely what happens when thinking takes place, if one abides by what happens in philosophy when thinking dwells, one runs up against the limit, against the 'other' of thinking. Even the expression 'the other of thinking' which Heidegger intentionally avoids can easily be misunderstood if one views the other in the light of the dialectic, or if one links it up with the limitations of the human faculties. It is much more the finitude of being itself. Just as a distinction obtains between beginning and commencement so also does it between end (*Ende*) and end (*Ende*). The end of philosophy can mean that philosophy ceases, either in the nineteenth century, with the absolute knowledge of Hegel, or in the twentieth century, with technology. This is however not the end of philosophy with which Heidegger is concerned. The end which concerns Heidegger is already there with the Greeks, at that moment in which philosophy establishes itself. In our time, it has reached a culmination or has been gathered into its most extreme possibilities, but it accompanies all thinking.

What remains most questionable with Heidegger is perhaps that he always thinks the outset and the outcome in the light of history and historicity. The concept of 'history' (*Geschichte*) is, in my view, the most questionable in Heidegger's thinking and a concept which can only be phenomenologically justified with great difficulty. Perhaps Heidegger already appreciated that and, for this reason, speaks of 'destiny' (*Geschick*). According to Heidegger, destiny is not to be thought out of a happening which can be characterized by means of a course of events and through a process. Sending (*Schicken*) means preparing, arranging, bringing each thing to that place where it belongs, making room for, assigning. Destiny is what furnishes the temporal play-space (*Zeit-Spiel-Raum*) in which beings can make their appearance and in which philosophy in general first becomes possible. This furnishing is a self-proffering and self-withdrawal and therefore also essentially bound up with commencement and end. The phrase 'destiny of being' is however not an answer but a question, amongst other things, the question concerning the *essence* of history, the *essence* of commencement and end.⁴⁶ To think this belongs to the task of thinking at the end of philosophy.

Introduction

Christopher Macann

We are too late for the gods and too
early for Being. Being's poem,
just begun, is human being

(Heidegger, *Aus der Erfahrung des Denkens*)

Reduction: Construction: Destruction. These are the three key terms in terms of which Heidegger, in his Marburg lectures of 1927, prepared the ground for the programme outlined (though never completed as planned in *Being and Time*). The first of these three terms implies a *backward* reference to Husserl, the master from whom Heidegger was at this very time winning his independence as a thinker. The second, implies a *contemporaneous* reference to *Being and Time*, Heidegger's first (and in a certain sense also his last) great constructive achievement. The third implies a reference *forward* to Heidegger's extensive critical coverage of the history of philosophy, designed to support and confirm the position established in his own philosophical thinking. Though only the third of these three terms is specifically relevant to this volume on Heidegger's approach to the history of philosophy, all three terms require careful consideration since they are used here in a sense which is by no means obvious.

Reduction. The term is taken from Husserl – as is made clear by Heidegger's own mention of Husserl in the following passage:

For Husserl, the phenomenological reduction . . . is the method of leading phenomenological vision back from the natural attitude of human being whose life is involved in the world of things and of persons to the transcendental life of consciousness and to the noetic noematic experience in which objects are constituted as correlates of consciousness. *For us*, the phenomenological reduction means leading

phenomenological vision back from the apprehension of a being, no matter what the character of such an apprehension might be, to an understanding of the Being of this being (projecting upon the way it is unconcealed).

(*Grundprobleme der Phänomenologie (Gp)*, GA 24, S. 29)

In his article on 'The question of being and transcendental phenomenology', John Caputo rightly lays great stress on this passage, and regrets that Heidegger did not have more to say on the subject of the reduction. That Heidegger never again sought to understand his own movement of thought out of the concept of the reduction already indicates that, in reality, this concept did not have much to do with his own conception of phenomenology. And this is confirmed by the very different use he makes of the equivalently phenomenological term 'transcendence', whereby it no longer means either the surpassing of the act side of the correlative procedure to the object side, or the surpassing of the sphere of immanence toward the objectively real which, as such, is transcendent to consciousness. On the contrary, by transcendence Heidegger now means, more or less, the surpassing of beings toward their being – in other words, much the same as he means by 'reduction'. That, for Heidegger, reduction and transcendence mean much the same thing while, for Husserl, the one means the very opposite of the other (a movement from natural objects to transcendental consciousness, on the one hand – a movement from transcendental consciousness towards intentional objects, on the other) simply confirms the irreconcilability of the two conceptions of phenomenology.

Interpreters of the relation of Husserl to Heidegger tend to divide into two camps, those who emphasize the discontinuity and those who emphasize the continuity between two thinkers, both of whom shared the same starting point in phenomenology and one of whom, at least, never ceased to proclaim his commitment to the phenomenological way of doing philosophy. In fact however, in both instances we are necessarily faced with a difference in identity or identity in difference. For example, in his study on social ontology, *The Other*, Michael Theunissen, while conceding the paucity of the references to Husserl in *Being and Time*, pays especial attention to the continuity between the two by talking of an 'anthropological shift',¹ the transformation of intentional constitution into projection² and the transformation of an empty indication into its concrete fulfilment³ – to the point that the theory of being-with can appear as a 'radicalization' of positions to be found in Husserl.⁴

Similarly, in his paper on 'Heidegger and the principle of phenomenology', Klaus Held appeals to the principle of evidence as the link that binds Heidegger to Husserl. At the same time, Held focuses upon the concept of 'world' as the key to any understanding of the transformation

which Husserlian phenomenology undergoes. This focus does a double service. It not only throws light upon the transition from Husserl to Heidegger (from the world-less transcendental subject to the being-in-the-world of *Dasein*) but also helps to explain Husserl's own 'turn' to a later 'genetic phenomenology' of the life world. Indeed, Held presses his case so far that the theme of the world horizon actually also throws light upon Heidegger's own *Kehre*. In place of the structure of 'projection' which, according to Heidegger's own later self-interpretation, still carries Husserlian connotations of 'subjectivism', we find a concept of *Gelassenheit* characterized by a 'self-withdrawal' which creates the leeway for disclosedness. And yet the starting point in a *Daseins analytik* is never entirely lost sight of, even if the order of priority (*Dasein-Sein*) is reversed. 'Clearing', Held tells us, ' "needs" *Dasein* as the place where world emergence can alone come to be.' The significance Held attributes to the renunciation of will-ful-ness certainly helps to explain the anti-voluntarism of Heidegger's late philosophy, even though, in my view, it seems to underestimate the extent to which, for Husserl, the reduction can also be regarded as an overcoming of wilfulness, admittedly, an overcoming which, in the context of Husserl's phenomenology, represents a surrender to 'reason' rather than to 'being'.

In my own independent examination of the relation of transcendental to ontological phenomenology, I sought to bring out the affinity (as also the opposition) between these two conceptions of phenomenology in terms of what might be called an 'inversion effect' (a movement 'upward' from the natural attitude to transcendental consciousness contrasting with a movement 'downward' from the ontic to the ontological). But however successful such an inversion might be in explaining the difference, it could not have accounted for the identity (or affinity) between the two positions without also appealing to what might be called a 'conversion effect'. Critical to an understanding of the conversion of transcendental into ontological phenomenology is a structure which I call the 'ontological transposition'. And critical to my presentation of the structure of an 'ontological transposition' is a shift (only implicit in Husserl's thought, though it can always be made explicit) from a principle of 'presence' to an alternative principle of 'coincidence'. Hence the title of the work: *Presence and Coincidence*.⁵

If a procedure of this kind is indeed legitimate, it means that an alternative way back to the origin is thereby made available. For Heidegger, the way back (and this is also true of Husserl's 'life-world' enquiries into the 'pre-predicative' foundations of natural consciousness) to the origin passes by way of phenomena encountered, in the first instance, upon the 'ontic' plane. I call this an 'objective regression'. The way made available by an 'ontological transposition' I call the 'reflective detour'. The advantage of the long way around (via transcendental consciousness)

lies in the fact that, so far from excluding transcendental phenomenology from the analytical circuit, it actually requires the inclusion of the latter within the movement of return. But if, in the end, and despite the step back effected by the reduction, transcendental phenomenology rejoins ontology in its investigation of the pre-predicative structures of the life-world, this can only be because the method of constitution is nothing but a transcendental re-construction of an originally operative construction. Hence the 'indirect' (Ricoeur speaks of a 'long way' rather than a 'short way') way back, via the 'reflective detour', only takes us back to what was originally lived out in, or by, an anonymous (Merleau-Ponty's term), operative (Husserl's term) intentionality, a *practical cogito* to borrow from Merleau-Ponty yet again.

Such a distinction between the primordial, as originally lived, and the primordial, as conclusively recovered, in turn calls for a distinction between the *order of being* and the *order of analysis*. In the order of being, the ontological sphere is the first – the primordial in the literal sense of that word. But in the order of analysis, it is the last. This discrepancy between the order of being and the order of analysis is one which is certainly implicitly (even if not explicitly) acknowledged by Heidegger in *Being and Time*, for example, in a passage where he says:

Here 'Being-ontological' is not yet tantamount to 'developing an ontology'. So if we are to reserve the term 'ontology' for that theoretical enquiry which is explicitly devoted to the meaning of entities, then what we have in mind in speaking of Dasein's 'Being-ontological' is to be designated as something 'pre-ontological'.⁶

But if the reduction, in any sense whatever, still does open the way to an understanding of the being of beings, how does such a 'step back' out of what is proximally and for the most part simply *given* take place? Husserl furnishes a method. The nearest to such an account in Heidegger is to be found in the phenomenon of anxiety – and it is for this reason that it has often been said that 'anxiety' is Heidegger's reduction. What is important is the recognition that *some such procedure* is essential if the ontic plane upon which Heidegger's analyses take their start is not to capture and absorb the attention of Dasein (as is indeed suggested by the structure of Falling) to such a point that the move back can never actually be accomplished (or its accomplishment accounted for). As soon however as one substitutes the 'reflective detour' for anything like an 'objective regression', not merely the 'step back' out of the ontic plane becomes perfectly intelligible (since it is negotiated along Husserlian lines) but the movement of return also becomes perfectly intelligible (since the radicalization of transcendental philosophy itself enforces just such a movement of return).

Construction. The reduction is complemented by a construction. Some care is needed in the use of this term. For in *Being and Time* the term 'construction' is used in a negative sense to denote the introduction of dogmatic principles from the outside. As John Caputo points out: 'The genuinely phenomenological construction is not impressed from the outside, but is prompted from within by the things themselves.' In other words, the sense in which Heidegger employs the term in his *Grundprobleme* is the sense in which *Being and Time* will furnish the construction that complements the reduction. Since Heidegger's constructive achievement falls within the compass of volume I, let us leave aside the complex question of construction to focus finally on the third of the three terms, the one most appropriate to this volume on Heidegger's relation to the history of philosophy.

Destruction. 'Destruction' here means going back to the historical sources of leading philosophical concepts to see how they got established with the meanings that have become familiar to us as inheritors of the tradition and with a view, more particularly, to uncovering the original founding experiences out of which these concepts arose and which, in the course of the historical development, got covered up or rigidified into false or inflexible 'constructions'. The Heideggerian term 'destruction' thus has much in common with what has lately become known as 'de-construction', with this absolutely critical difference that, for Heidegger, destruction is always, and necessarily, the complement of construction whereas, for the de-constructivists, destruction appears to have become an end in itself, not merely cut off from its constructive complement but actually refusing the very possibility of any such complement.

But if, for Heidegger, 'construction' and 'destruction' do complement each other, it follows that Heidegger's reading of the history of philosophy will be seen to lay the ground for his philosophy, while his philosophy will furnish the necessary hermeneutical clue to a certain way of understanding the history of philosophy. While Hegel alone among modern philosophers accords to the history of philosophy the importance attributed to it by Heidegger, Heidegger's ambition is quite different from Hegel's, indeed, in a certain sense, its exact antithesis. While Hegel looks back at the history of philosophy for confirmation of the developmental logic which he articulates in his pure philosophy and therefore not merely accepts this historical process as such but insists upon the impossibility of working out a developmental philosophy in the absence of the relevant guide-lines furnished by the history of philosophy,⁷ Heidegger sees in the history of philosophy the great obstacle to a proper understanding of being, an obstacle which cannot, for this very reason, be simply circumvented (let alone ignored) but has to be confronted head-on. So far from the history of philosophy exhibiting an ever more perfect approximation to the conclusively correct (Hegelian)

conception of reason, history conceals a truth which was there at the beginning and which has to be rediscovered by first undoing the very process by which it has been concealed from view.

But how far back does one need to go or, more emphatically still, is one *obliged* to go (to uncover the truth of Being)?

The quest for primordality, as Marlène Zarader's paper beautifully shows, led Heidegger to trace the understanding of being back not merely to the Greek but to ever more primordial Greek sources, Aristotle first of all (who saves philosophy from the distortions of Platonic ideation), then back beyond Plato to the pre-Socratics and then back still further to a yet more fundamental origin in the light of which even pre-Socratic thinking takes on the guise of a misunderstanding. For a thorough investigation of the Aristotelian origins of Heidegger's first philosophy, I am indebted to Franco Volpi whose paper treats the subject in a masterly fashion. But the other dimensions of Heidegger's involvement with Greek thinking are also admirably handled by Maly (the pre-Socratics) and Dostal (Plato).

If we follow the Heideggerian principle that the *further* back one goes in the history of philosophy the *nearer* one comes to an acknowledgement of the primordial truth of Being then a very obvious query arises. Why only go back to the Greeks, who were cultural infants at the time when the more ancient cultures of the East had already seen some of their greatest days? Why go back to Greek when a much older language (Sanskrit) attests to a philosophical tradition (the Vedantic) which not only goes back further but goes so far back that it reaches beyond written language to an oral, and for this very reason poetic, tradition which was only later transcribed into writing? This is no incidental question, because the Vedantic tradition is founded on a principle which, if interpreted in a certain, not particularly obtuse, way could well be regarded as the most primordial ontological principle of all: the identity of Atman, or soul and Brahman, or God. And now we are immediately brought face to face with the figure of Sri Aurobindo.

I had hoped to elicit a paper comparing the work of Heidegger and Aurobindo. In the absence of such a contribution I would like to say a few words here. The driving force of Indian philosophical thinking, from its origins in the Vedantic texts right through to present times, has been spirituality – religion in the broadest sense of that word. The greatness of the Indian tradition lies in the fact that, not content with intellectual constructions (which are, nevertheless, to be found in great abundance), they developed a life-practice – meditation – specifically designed to awaken the consciousness needed to engender and confirm the insights expressed in their writings. Indian philosophy is, from beginning to end (and even in its most abstruse extrapolations), an 'empiricism', provided only that one is prepared to extend the concept of experience to cover

a specifically *spiritual experience* recuperated and prompted by way of a specifically *spiritual practice*. This is why Sri Aurobindo had to write his philosophy twice, the first time as a philosophical theology (*The Life Divine*), the second time as a philosophical psychology (*The Synthesis of Yoga*) – though in truth these disciplinary terms ‘theology’, ‘philosophy’, ‘psychology’ meant little or nothing to Aurobindo who was by academic training, a philologist, and by personal vocation, a poet.

The parallels between Heidegger and Aurobindo are not merely extraordinary in themselves but all the more extraordinary for having been developed in complete isolation each from the other. Heidegger is noted for his mastery of the Greek language and his attunement to the inner dynamics of Greek philosophical thought. Aurobindo was not only a classicist by training (he won prizes for Greek and Latin verse compositions both as a schoolboy and as a university student at Cambridge), he then went on to master a much older language (Sanskrit) together with the philosophical tradition that belongs to it (the Vedantic philosophy). Heidegger is noted for his later efforts to bring philosophy and poetry closer together. Aurobindo was not only appreciative of the writings of the poets, he was himself a poet of the first rank and, indeed, the author of the longest poem in the English language (*Savitri*), a poem which can only be adequately compared with Milton’s *Paradise Lost* and *Paradise Regained*, on which it was to some extent modelled. Like Heidegger, Aurobindo was also actively engaged in politics (more actively than Heidegger ever was). But whereas Heidegger (however marginally) was for a while involved with one of the more lamentable regimes of the century, Sri Aurobindo spent a significant portion of his life actively engaged in contesting (verbally) the British occupation of India – a cause whose legitimacy few would question. Indeed, had he so chosen (which means, had he been ready to spend a great part of his life in gaol) he could have been the Gandhi of the Indian independence movement and did indeed live long enough to witness the accidental (?) conjunction of Indian Independence Day with his own 75th birthday (15 August 1947).

More relevant for the specific purposes of this volume, Aurobindo worked out a developmental theory (both of consciousness and of the history of consciousness) which exhibits a quite characteristic trait. For Aurobindo, any examination of what ‘has been’ is always undertaken in view of a prognostication, the anticipation of what is ‘yet to be’, in so far as this ‘yet to be’ is indicative of a spiritually higher attainment. Even the move away from the origin (which Aurobindo interprets somewhat along Heideggerian lines as a spiritual diminishment) is a necessary ‘descent’ without which the new ‘ascent’ would not be possible. For the turning away from the world, characteristic of traditional Indian spirituality, led, in the end, to a spiritual sterility and inefficacy which finds its corrective in Western materialism which, for its part, however blind it

might be to the spiritual destiny of humankind, does lay the foundation for the revitalized spirituality which finds expression in his own work.

We are now in a position to contrast three models for the interpretation of the history of philosophy, with particular reference to the development of a philosophy. The first is the Hegelian model which sees the development of the history of philosophy as a cumulative progress leading up to, and so ending with, the work of the interpreter.⁸ The second is the Heideggerian, which sees the development of the history of philosophy as a persistent degeneration from original sources, ending up with the interpreter as the philosopher who captures the moment at which philosophy is no longer able to continue to philosophize in the traditional manner.⁹

However different these two interpretative models might be (IJsseling talks of an 'inversion'), they do at least agree in thinking that philosophy (Western philosophy, at least as traditionally conceived) comes to an end with the philosophy of the interpreter. But there is a third interpretative model, a model which sees the need for a careful examination of the development of the history of philosophy and, moreover, recognizes the importance of a return to origins – but only as a preparation for a further advance. This is the model represented by the thinking of Sri Aurobindo. In the context of this third model, the task of the philosopher is seen in a very different and, I would argue, more fruitful and certainly more hopeful, light; to master a philosophical tradition, with especial reference to its original sources, to contribute to it, and then to leave that contribution as a legacy to be developed further by those still to come. This means not being the last, the conclusive, the final term but a link in a chain whose backward reach gives one some grounds for speculating about developments yet to come. To the Heideggerian task of overcoming the dichotomy of 'realism' and 'idealism', a dichotomy intrinsic to the Western tradition, Aurobindo opposes a more comprehensive task, the task of overcoming the dichotomy of spiritualism (the East) and materialism (the West). And the reality of such an 'overcoming' resides, for Aurobindo, not so much in a new kind of thinking as in a new way of being, a new spirituality for which Aurobindo invented the term 'supramental' – a term which bears many of the same traits as those brought out by Jean Gebser in his quite independent discovery of an 'a-perspectival world' or an 'integral consciousness'.¹⁰

There can be no doubt that philosophy has moved on beyond the point reached with the Hegelian system. The twentieth century has certainly produced its own great figures (e.g. Husserl and Heidegger to mention only two) of whom one, at least, has done his best to disqualify the Hegelian claim to ontological supremacy and for reasons which Souche-Dagues finds highly suspect (see chap. 25, vol. II of the present work).

In due course of time we shall be in a position to determine the validity of the Heideggerian claim.¹¹

For the time being, it seems more pertinent to raise a question with regard to the very desire to represent a given thinker as conclusive, terminal, the thinker through whom an entire intellectual tradition is summed up and consummated, the thinker whom no successor can think of thinking beyond. Surely, there is something pretentious about the very attempt to voice such a claim, however it may be set about with neutralizing qualifications?¹² It is worth recalling that humankind is a very recent experiment in life. The dinosaurs reigned for over 140 million years and perished of the perilous extravagance of overgrown bodies. We have been here little more than one million years and are surely entitled to hope for an ascendancy of comparable duration, that is, unless we too *soon* perish of the even more perilous extravagance of overgrown minds – by which one can surely only mean one thing, minds that, in some sense or other of that nebulous term (so dear to Aurobindo and yet so resolutely disapproved by Heidegger), have failed to develop the ‘spiritual’ potential inherent in human being.

One thing is clear however. Whether we adopt the conclusive model of the history of philosophy or whether we adopt the transitional model, which sees human being as a ‘being on the way’ (*homo viator*, to use Gabriel Marcel’s phrase), this decision will retrospectively colour the way in which we view the history of philosophy and therefore the way in which we view Heidegger’s own extensive interpretations.

In his paper on ‘Heidegger and Descartes’, Jean-Luc Marion has succeeded in bringing out the continuity of modern philosophy, *despite* the apparent finality of Heidegger’s interpretation. Not content to merely trace the obvious antagonism between Heidegger and Descartes, and to do so in depth and detail, he has tried to bring out the sense in which this nominal antagonism conceals a deep-rooted allegiance to the ‘subjective turn’, the very turn from which Heidegger was himself, at the time, already trying to turn away. This is not only surprising in itself but also helps to explain the further turn away from anything like a *Daseins analytik*. In spite of everything he might have said to the contrary, ‘mineness’, according to Jean-Luc Marion, conceals a component of ‘egoity’, ‘projection’ an element of the a priori which marks Heidegger’s continued affiliation with a tradition he was later to dismiss (and to seek to ‘overcome’) as ‘metaphysical’. But then even this ‘overcoming’ continues to remain bound by the parameters of modernity!

Such a view is fundamental to any understanding of the French response to Heidegger. Again and again, leading figures in the French phenomenological tradition have tried to save the Cartesian heritage of a philosophy of consciousness against Heidegger’s critique and this despite their deep indebtedness to the revolution inaugurated by Heidegger.

That both Sartre and Merleau-Ponty (to cite only the two best-known French philosophers of the post-war era), should have attempted to do just this is too well known to be worth pursuing further. But it is worth noting that a very recent book on the philosophy of Paul Ricoeur is entitled *The Cogito and Hermeneutics*,¹³ precisely because the author (Domenico Jervolino) sees in the life's work of his subject an attempt to reconcile the Heideggerian claims of a hermeneutical philosophy with the seemingly rival claims of a *philosophy of consciousness*.

Although Aristotle was the figure from whom Heidegger drew the inspiration to inaugurate his reversal of the respective primacy of *theoria* and *praxis*, and Descartes the only figure to whom Heidegger devoted a specific section of *Being and Time* (if we exempt the section on 'Hegel's conception of time' in the second part), it is, in my view, Kant whose 'haunting' presence is most evident throughout *Being and Time*. It is not just that, in the celebrated Kant book, published shortly after *Being and Time*, Heidegger was able to put into practice the hermeneutical principles first elaborated in *Being and Time* (see my article in this volume); the very structure of *Being and Time* itself attests to a close assimilation of the procedure adopted in the *Critique of Pure Reason*.

Just as important as Heidegger's indebtedness to Kant for the structures and procedures of *Being and Time* is his conversion of the Kantian, transcendental philosophy into a (proto)ontology. And just as significant as the interpretative transformation he works upon the Critical philosophy is the fact that he does not, as we have already noted, attempt to subject the Husserlian transcendental philosophy to an equivalent transformation but rather distances himself from Husserl's project with a view to reclaiming for himself the right to the very slogan Husserl adopted to characterize his own intellectual endeavour: To the things themselves! While Kant is interpretatively appropriated (for ontology), Husserl is expropriated (from phenomenology), not so much by way of an explicit critique of Husserlian phenomenology (though elements of such a critique are to be found all over the first philosophy) as rather by way of Heidegger's own development of an alternative phenomenology.

Both the ontological *appropriation* of Kant and the complementary phenomenological *expropriation* of Husserl bring with them the same result, a refusal of the transcendental in favour of the ontological, a refusal of 'heights' in favour of 'depths'. But if one takes up a stand outside this decision one can see that *both* options correspond, in a certain sense, to what has been meant by the term 'metaphysics'.

Through a historical accident, philosophy became linked with the nomenclature 'metaphysics'. And yet the name is appropriate in as much as it designates a thinking which passes 'beyond' what is ordinarily taken to be the real, the physical (After the Physics). This straining beyond the ordinary toward the extra-ordinary, this surpassing of the physical,

typically assumes two forms, a movement 'up' or 'forward' and a movement 'down' or 'backward'. These are only metaphors. And yet it is easy enough to clothe these metaphors with the trappings of historical figures. In Plato, we find the first tendency, in Aristotle, the second; in rationalism, we find the first tendency, in empiricism, the second; in Kant, we find the first, in Hegel, the second; in turn, Hegel's attempt to embody logical categories in and through the concrete historical processes through which they manifest themselves gets interpreted by Marx as yet another abstract speculative endeavour which must itself be 'turned on its head' by recourse to the concrete historical situations in which men live and out of which therefore they are obliged to think. Finally, and in this century, we find, in Husserl, a recapitulation of the Platonic vision of the pure forms (*eidōs*) worked out in conjunction with a Kantian transcendental procedure.

In the light of history, it therefore comes as no surprise that Husserl's upward-oriented, abstractive intellectual enterprise gets corrected with the Heideggerian regression to the ground. In fact of course, and as I think every one of the great thinkers themselves always appreciated, both dynamics are essential. The movement upward and forward will become a sterile and vacuous endeavour (Kant's 'light dove' mistakenly imagining that its flight would be still easier in empty space) if it is not constantly brought down to earth again. But the 'plunge' into the depths may not only bring philosophy 'down to earth', but also perhaps lead down to 'infernal' realms beneath the earth, not just the ground (*Grund*), but even, perhaps, the abyss (*Abgrund*). Hence the need not merely to *ask* but also to seek an *answer* to the question concerning the proper relation which obtains between these two, seemingly contrary, directives.

Heidegger is fairly consistent in his choice of the path directed toward the depths.¹⁴ He refuses the terminology historically linked with the heights, the terminology of consciousness, of subjectivity, or worse still, of transcendental consciousness and transcendental subjectivity. The few occasions on which he resorts to the language of *Geist* he does so more with a view to executing a rhetorical flourish than an effective analysis. And yet the refusal of the heights is much more problematic, and indeed much less conclusive, than might appear to be the case. The Husserlian reduction is rejected, and yet we are left with a 'step back'. The Kantian appeal to 'higher faculties' is dismissed, indeed to such a point that apperception hardly figures in Heidegger's assessment of the significance of the Critical philosophy. And yet 'Conscience' calls Dasein back out of its fallenness in the 'They'. The traditional problem of solipsism disappears and yet the style of Heidegger's thinking takes on an ever more self-absorbed and idiosyncratic tone – as Christina Schües has shown in her paper comparing Heidegger and Merleau-Ponty. But if the two *opposed* metaphors of heights and depths leave things antinomically

unresolved, what of the image of the circle, the image of heights transformed into depths and depths into heights?

Despite the obvious inversion, Hegel and Heidegger share one common feature in their respective conceptions of the history of philosophy, not merely that, in reality, they both tend to operate with a linear conception of philosophy and of its historical development (the one moving forward, the other backward) but that they do so despite a *nominal* (indeed almost a logical) commitment to a cyclical conception (the hermeneutical circle/the onto-logical circle). To take Hegel first, the famous passage from the Preface to the *Phenomenology* makes the circular character of ontological reasoning clear.

True reality is merely this process of reinstating self-identity, of reflecting into its own self and from its other, and it is not an original and primal unity as such, not an immediate unity as such. It is the process of its own becoming, the circle which presupposes its end as its purpose, and has its end for its beginning; it becomes concrete and actual only by being carried out, and by the end it involves.¹⁵

But if one turns to the third Part of the *Encyclopedia* entitled 'Philosophy of spirit', and to that division of it which most closely approximates a Dasein's analysis, the first division devoted to subjective spirit, one finds, at the beginning, an 'Anthropology'. As the beginning, this anthropology should surely have been presented in such a way as to lay the ground for the reflective recuperation undertaken in the third Division in the name of Absolute Spirit. But such is Hegel's commitment to a progressive conception of Process that the beginning in the Natural Soul is presented as the 'sleep of the soul' and punctuated with disparaging remarks about the original affinity of man and animal and about negroes being the children of humankind. So far from recommending a recuperation of the origin, the Hegelian conception of history presents us with a *process* which is a uniform *progress* from African pre-civilization, through oriental civilization, to a European cultural culmination which has little in common with its origins and which, for this very reason, is marked by a *superiority* which, philosophically speaking, is attested in its capacity to articulate the logic of the process, initially in a rudimentary way; finally, in a completely finished fashion, i.e., the Hegelian philosophy. This conception of 'progress' was by no means a preconception peculiar to Hegel but a prejudice common to his time.

It was not until the twentieth century made us aware of the destructive implications of scientific reasoning that we found ourselves in a position to re-evaluate the significance of so-called 'primitive' culture and civilization. The closeness to, respect for, and affinity with nature, which we have lost, we find in the Bushman, as the writing of Laurens Van der

Post attest. The sense of the sacred pervading all of nature, we find in the American Indians as also in the Australian Aborigines. The two oldest cultures of all, the Indian and the Chinese, are unanimous in pointing back to an original, archaic civilization which was, or is reputed to have been, in certain respects, a 'golden age'. Here Heidegger would seem to be the surer guide.

With Heidegger, the notion of circularity enters in with the famous question of the 'hermeneutical circle'. But the circularity of the 'hermeneutical circle' does not really consist in an understanding which accomplishes a circle, for which, therefore, going back is only possible by moving forward and for which, equivalently, moving forward brings understanding back. What is at issue is something quite different, something which, in analytical language, might be called 'presupposing what one is supposed to be proving'. It is for this reason that Heidegger frequently presents his position as a response to the logical charge of circular reasoning. 'It is not to be reduced to the level of a vicious circle, or even of a circle which is merely tolerated. In the circle is hidden a positive possibility of the most primordial kind of knowing.'¹⁶ Or again:

If we must first define an entity in its Being, and if we want to formulate the question of Being only on this basis, what is this but going in a circle? In working out our question have we not 'presupposed' something which only the answer can bring?¹⁷

What is presupposed is, of course, that pre-ontological understanding of human being which serves as a guide for the disclosure of the existential structures which will be taken to characterize Dasein. Amongst these structures we find Understanding. 'The circle in understanding belongs to the structure of meaning.'¹⁸ In turn this means that there can be no escaping the circle whose structure is therefore taken to typify the very structure of ontological understanding itself. 'We must rather endeavour to leap into the "circle", primordially and wholly, so that even at the start of the analysis of Dasein we make sure that we have a full view of Dasein's circular Being.'¹⁹ 'What is decisive is not to get out of the circle but to come into it in the right way.'²⁰

So the right strategy consists not in trying to avoid the circle but in getting right into the circle – and, one is tempted to say, moving around it in the right way, except that, for Heidegger, there really can be no moving 'around'. Instead of an 'around', what we find is a linear regression backward, back beyond beings to their being, back beyond the ontic to the ontological, back beyond the existentiell to the existential.

To sum up: with Hegel, we find a more explicit articulation of the circularity of philosophical understanding, but his commitment to 'progress' makes it impossible for him to envisage the 'process' as one

whereby philosophical understanding would have to take seriously its first and most original expressions. Heidegger leaves us in no doubt about the negative implications of 'progress' and therefore makes clear the need to return, but the recuperation of the origin does not bring with it an 'advance' but rather recommends a critique of the 'forward march' of technological reason. At least hypothetically, from these two models a further possibility springs to mind, that of envisaging the discipline of ontology as a procedure whereby the way 'on' is seen to lead 'back', the way 'forward' to culminate in a movement which, of its own accord, leads us 'backward' to the origin.

There are many reasons for insisting upon the appropriateness of the above conception of the circle or, if you prefer, the spiral. First, I would argue that Heidegger's ontological revolution would never have been possible without the intellectual resources made available to him by Husserl. Second, unless some way of accounting for the relation between transcendental and ontological phenomenology is explicitly avowed, we are left in the embarrassing situation of being confronted with two irreconcilable ways of doing what, for good reasons, goes by the same name: phenomenology. Third, if a determined attempt is not made to integrate the two rival conceptions of phenomenology, the discipline of ontological phenomenology may, and especially in the hands of its less well-versed disciples very readily will, take on connotations quite contrary to those intended by its founding father – something akin to a pragmatic, even behaviouristic, interpretation of human reality.²¹ Fourth, the need for a recuperation of the primordial not only serves to remind us of the destructive implications of so-called 'historical progress', it also helps to bring out the constructive implications of what used to be dismissed as 'primitive' – as also the potentially reconstructive implications of scientific technology. The ecological movement is nothing but an extended commentary (written in scientific language) upon a natural attunement which has been lost only because we have temporarily ceased to take account of what once we were (and which we can never finally cease to be) – creatures of nature.

Or, if you prefer, creatures of God – *Deus sive Natura*.

Nobody would have applauded more wholeheartedly than the divinely inspired Aurobindo, the following passage from Heidegger, a passage which, through a commentary on Hölderlin, reproduces the spirit of the poetically voiced citation placed at the head of this Introduction:

It is the time of the gods that have fled *and* of the god that is coming. It is a time of *need*, because it lies under a double lack and a double Not: the No-more of the gods that have fled and the Not-yet of the god that is coming.²²

7 'The same development of thinking which is portrayed in the history of philosophy is portrayed in philosophy itself, but freed from that element of historical externality, purely in the element of thinking.' From the Introduction to the *Encyclopedia*, §14.

8 In truth, Hegel sees the history of philosophy as ending with the philosophy of the interpreter only in the sense that it is in the past, and in the past alone, that the philosopher is able to grasp the essence of the process – *Wesen ist was gewesen ist*.

9 This retrospective vision is, of course, qualified by Heidegger's prospective anticipation of a new kind of 'thinking'. For instance, in his essay, 'The end of philosophy and the task of thinking' Heidegger talks of 'the possibility that the world civilization which is just now beginning might one day overcome the technological-scientific-industrial character as the sole criterion of man's world sojourn'. From *On Time and Being*, tr. Joan Stambaugh (New York: Harper & Row, 1972), p. 60.

10 Jean Gebser, *Ursprung und Gegenwart*, tr. Noel Barstad and Algis Mickunas as *The Ever Present Origin* (Athens, Ohio: Ohio University Press, 1984).

11 Heidegger qualifies his claim by saying that it may take as long for philosophy to reach its 'end' as it has already taken for its entire development up to the present.

12 Heidegger raises this question of pretension in a passage from 'The end of philosophy and the task of thinking'. 'Is there not an arrogance in these assertions which desires to put itself above the greatness of the thinkers of philosophy?' p. 60.

13 Domenico Jervolino, *The Cogito and Hermeneutics*, tr. Gordon Poole (Dordrecht: Kluwer Academic, 1990).

14 What one demands of a philosopher above all else is consistency. That Heidegger's thinking about philosophy and about the history of philosophy fit together is a measure of his ability to respond to the requirement of consistency. However, Hegel's position on the status of the origin is also worth noting. From the standpoint of Nature, the origin is the most concrete. From the standpoint of Mind, the origin is the most abstract because it lacks all those thought determinations through which it will be concretized.

dein Gedächtnis.

Paul Celan

These pages have a double objective. In the first place, to show that the way in which Heidegger interprets the pre-Socratics – in consequence, the way in which he understands their relation to later thinking, whether it is a matter of later Greek thinking or of that which stems from the latter – attests to a notable evolution in the course of the work, an evolution in which it is possible to distinguish three distinct periods, each irreducible to the other. In the second place, to show that, no matter what the period in question, the status accorded to the early Greeks carries with it the main lines of Heidegger's thinking at that time, thereby making possible a division of his entire work. These main lines of thought are to be found variously sketched in each of the periods in question; on the one hand, a certain conception of history as well as the manner in which Heidegger himself stands in relation to this history, on the other, a certain conception of being (more exactly, of the question of being), as well as the way in which Heidegger defines the task of thinking with regard to this question.

This double project implies that I stick to the main lines (my objective being precisely to set them out here), letting go of the more detailed analyses – to which I have devoted a more extensive study elsewhere.¹

I

The first period was that of Marburg. The master work obviously remains *Sein und Zeit*, but the context in which it was developed can now be brought to light more clearly since we are now in possession of several lectures given by Heidegger during the years 1923–8.²

What is the status he attaches to the earliest Greek thinkers? The first point to note is that, in Heidegger's view, no break can be made between the pre-Socratics and Plato. Thought through in a fundamental continuity, they are for the most part characterized by an undifferentiated plural: 'The Greeks'. This is because, at this time, Heidegger was most concerned with what separated 'the Greeks' from the rest; though even here it is not possible to talk of a break, in the strict sense of that word. What is regarded as distinguishing the former from the latter is something in the order of a covering over. The questions which were still 'alive' with Plato and Aristotle have lost their appeal, as well as their urgency, in the 'hardening'³ inaugurated by the tradition. If in this epoch thinkers still play a model role, it is the Greeks', and if it is possible to attribute a leading role to certain figures it is to Plato and Aristotle,⁴ through whom a 'battle of giants over being' makes itself known.⁵

Moreover, this battle will have to be resumed in order to carry it further still than Plato and Aristotle succeeded in doing. The latter are therefore the object of a double critique. On the one hand, they proved incapable of carrying their investigations through to the end, and of bringing them to full clarity and this because they failed to get as far as the crucial question concerning the 'meaning' of being. This is why their investigations have to be prolonged. On the other hand, and more seriously, they already began to formulate an answer by understanding being within the field of *Vorhandenheit*. In this respect they still belong themselves to the very tradition which it is necessary to 'de-construct'.

The task entered into during the Marburg period is therefore characterized by a double movement of 'return to the origin'. On the one hand, a movement backwards, in the order of the historical luminaries, back toward the origin of the entire Western tradition. This movement assumes the form of a return to Greek ontology and by way primarily of the Aristotelian problematic. On the other hand, a movement in depth, in the order of the conditions of the possibility, back towards the Aristotelian problematic, which now finds itself subjected to a new phenomenological inquiry.⁶

It might well appear as though this double move were something like the first attempt – still incomplete, since not pushed back to the pre-Socratics – at that movement towards the origin which characterizes the later works. This is not however the case, and I would like to indicate

quickly the structural differences which make up the specificity of this period.

In the first place, if Heidegger is guided by the double concern of 'climbing higher' (in history) and of 'digging deeper' (in the process of questioning), these two concerns do not, nevertheless, coincide. By that I mean that the phenomenologically inspired movement in the direction of the foundations of Platonic-Aristotelian conceptuality make no claim to rejoining, or recovering, a more original *moment*. The destruction of the tradition certainly brings with it a 'remembrance' (*Erinnerung*) of the inaugural texts (Plato-Aristotle), but the critical work accomplished on these texts does not in any way imply the 'commemoration' (*Andenken*) of another text which would precede it. In climbing upwards into the transcendental field no *trace* is encountered in history.

In the second place, if Heidegger's research aims at a deepening of the process of questioning it does not, for all that, attempt to disengage another question. To be sure, Heidegger makes it clear that the Platonic question has not been posed in a sufficiently radical way, but it is nevertheless this question which remains, in his view, what is 'worthy of being questioned'.⁷

Hence the paradoxical character of this first position adopted by Heidegger *vis-à-vis* ontology. While, in a certain respect, being more critical than it will be later, it is, in the final analysis, much less critical. It is more so, first because it adopts the radical language of 'destruction' (instead of the more prudent language of *Verwindung*), and then because it remains caught in a perspective of denunciation (an unavoidable perspective, once the covering over has been charged to the account of the thinking, without yet having been attributed to being itself). But at the same time it is much less so to the extent that the critical accent bears much more upon the issue of transmission (where the question is no longer posed and therefore implicitly finds itself resolved) than on that of inauguration (where this question, even though inadequately clarified, at least has the merit of being posed). But, as we shall see later, as soon as another 'inaugural injunction' has been issued, it will prove necessary to go back beyond Plato towards another question. It will be this latter question which will then have to be worked out and not the Platonic question.

To put it more broadly, in spite of the renewal inaugurated in the process of ontological questioning, the general configuration within which such a process is inscribed remains unchanged. Throughout these years there is only one beginning for Heidegger (even though the latter is still not considered from the double standpoint: manifest/latent); from which there consequently follows only one single history which is indissolubly linked with that of being and of ontology (in accordance with the requirements of ontology itself, which claims that being is certainly its question).

As a result, Heidegger cannot situate himself other than in the perspective of a continuation of this same history (which has to be brought to its truth). Furthermore, the task of thinking is defined as the 'accomplishment' of metaphysics, and the question of being is reduced to the explicit elucidation of its 'meaning'.

To conclude: the status of the Greeks, in the course of these years at Marburg, is ambiguous. But it is the Greeks, *as a whole*, who are both solicited and criticized at one and the same time. So far from it being the case that remembrance and critique are distributed about distinct figures (the pre-Socratics/Plato), in two distinct moments of history (original/derived), divided into two questions (fundamental/directive) and into two registers (un-thought/thought), none of these splits are operative – in any case, they are not operative *as such*.

I do not want to spend any more time on these early years. A recent article, devoted to Heidegger's relation to the Greeks through the Marburg period,⁸ succeeds in bringing out very well the specificity of this first epoch. For my part, I would simply like to pursue the movement on further and bring it to a conclusion, by showing the nature of Heidegger's relation to the Greeks through the remainder of his itinerary.

II

The second period is far better known.⁹ It begins with the 'turn' (i.e. towards the beginning of the 1930s) and continues throughout most of Heidegger's works. What occurs to Heidegger at this time is that forgetfulness of being, formerly attributed to thought, must be turned back onto being itself: it is being which 'makes itself' forgotten, precisely because the act of drawing back belongs to its development as such, or rather, constitutes the sole means of this development. This entails an immediate consequence. Although it is necessary to distinguish two planes – one in which being develops, and whence it can thus be reached (the *Dasein*), and one in which it is forgotten (history) – the thinker searching for being is henceforward concerned only with one plane: that of history, where being develops specifically *as* forgotten. It is thus within this plane, and to the extent that it is absent, that being might be reached.

Does this mean that the difference between the giving of being and its conjuring away has disappeared from the Heideggerian problematic? Not at all. This difference is shifted within the only plane that subsists, and it is within this plane alone that the double figure now develops. History is in fact not only the site of forgetfulness/withdrawal (the one being identified with the other). It is the site of withdrawal and of forgetfulness: the place where the withdrawal of being takes place (which

is inherent to being itself) and the forgetfulness of this withdrawal (which, all the while being founded on the former, none the less remains within the realm of thought). That is to say that it is the realm of a *double* concealment.

What is to be the position of the thinker with regard to history understood thus? Since there is a doubling of concealment, the task will necessarily be one of duplication. On the one hand, there is no question of tearing it away from its withdrawal, but on the contrary, of retaining it more firmly than ever, that is, of recognizing it as this withdrawal itself. But, on the other hand, how would it be possible to recognize the withdrawal, if not by tearing it away from the forgetfulness in which it was held captive throughout our long history? Thus appears the necessity of a sharing out: the taking over by thought of the first plane of concealment (withdrawal) implies going beyond the second (forgetfulness).

However, if *forgetfulness* can be undone, it can only be so for Heidegger by rediscovering *memory* (I shall come back immediately to this link, which is as rich in consequences as in presuppositions). And whence would the thinker rediscover memory, if not from this inaugural time in which being, while *already* happening in its withdrawal, had not yet taken on the veil of forgetfulness? This is the privilege of the 'Greek morning'; it does not consist at all in being not having withdrawn there yet, but rather in its dispensing itself as what it is in reality, that is, as withdrawing – a withdrawing which was lost as such in later history, that is, forgotten and ever more decisively covered over.

Thus we see something like a genesis of prevalence granted to the pre-Socratics taking shape. It is in order to carry out the separation of the two registers of concealment that Heidegger is led to the split in the Greek world.¹⁰ And it is precisely the link established from the one to the other (a link between a separation in the order of meaning and a split in the historical order – or, if one prefers, a link between forgetfulness, which must be undone, and memory, which must be rediscovered) which constitutes the specificity, as well as the limits, of this second period.

It all happens in fact as if Heidegger, committed since the turn to a thinking which attempts to break with the categories of presence (and which does in fact break off by affirming that being dispenses itself enigmatically as withdrawal), does not manage to go to the limits of his own audacity. Being is certainly understood as withdrawing, thus as forgotten, but *it is necessary* (Heidegger seems to think) that it was not always forgotten, thus that the concealment which constitutes it was not concealed from the start: it is necessary that it be, for an instant at least, revealed outright as the withdrawal it is and that, for this reason, the decisive act through which it *escapes* should none the less have been

given. In other words, it is necessary that the truth of being *should have taken place* – be it only for the time of a flash of lightning.

It is this flash of lightning – or, to put it more rigorously, the idea of its dazzling light which went out as quickly as it came¹¹ – which disappears, as we shall see, from the very first texts. It was only when Heidegger had finished the long turn-around outlined in the beginning of the 1930s that he broke the last ties with the former conceptuality. To remain subject to these ties, in fact, was not only to think being as a presence. It was also to think that the absence, that absence which constituted the true character of being, had given itself at one time to the present, thus marking out a privileged instant in history. When being had become an absence never given as such, an absence understood as having always/already made itself absent, the movement was finished. But, at the same time, the ‘Greek morning’ had lost its privileged position.

Before going on, I would like to make a point clear that might lead to misinterpretation. Heidegger never stated that the first Greeks had *thought* being or truth better than their successors. Consequently, he never envisioned or encouraged any sort of *return* to the pre-Socratics. On the contrary, he unceasingly insisted on the fact that what he is commemorating, on the basis of a renewed meditation on the Greek language, had never been thought – and not even in the beginning. None the less, in his eyes, there is still a difference between the pre-Socratic beginning and what follows it. What does it consist of, then? This is a question too rarely asked and to which the texts offer only one answer in the final analysis: this difference consists of a greater or lesser *nearness* to the unthought, a nearness that finds its meaning completely in the *category* (which one can judge to be risky) of *experience*. What is not thought can in fact be experienced, thus constituting a sort of space where thought moves: this is the case of the first Greeks, and their privilege. It can thus no longer be the object of any experience, that is, it cannot only remain unthought, but even find itself, as such, covered over. It is this covering over which constitutes the long history of metaphysics.

Thus, Heidegger’s interest, beyond Platonic ontology, for what he calls the ‘Greek morning’ is not to be interpreted in the naive perspective of a return. It remains true that throughout most of his work, Heidegger divides up the Greek landscape, formerly seen as unitary, according to a cleavage based on the Platonic idea. Just as we have noted for the first period a (relative) privileging ‘of the Greeks’ – who are supposed to have thought what the later tradition forgot – so what stands out in the second period is a (far more radical) privileging of the ‘first Greeks’ – who *experimented* with what no one had thought, but what the later tradition, inaugurated by Plato, was not even to experience. Here we

see how Heidegger distances himself from the first period (since he recognizes that no one, not even the first Greeks, thought the truth of being), as well as how he remains removed in relation to the third (since he none the less affirms that this truth did have its witnesses in history).

What are the consequences for the ensemble of the second Heidegger's thought of this fundamental position he adopted toward the Greeks? The first, consisting of a new conception of the beginning, immediately entails a second, i.e. a radically new reading of history. That is, by granting the status of 'initial thinkers' to those who were formerly only 'pre-Socratics', Heidegger makes two distinct shifts possible. (1) The departure point is duplicated. It can no longer be reduced to the manifest beginning, which opens up with Plato, but includes a completely different one – hidden, covered over, unrecognized – which appeared with the very first Greeks. (2) At the same time, history is dissociated – it is no longer something which manifests itself on the basis of the Platonic question, but which assumes the form of another question, a hidden question, which emerges with the first Greeks. Thus to affirm, as did the metaphysical tradition, the inaugural character of Socratic-Platonic conceptions is not only to misunderstand the genuine beginning. It is, far more essentially, not to take into account a whole side of history – i.e., to condemn oneself to misunderstanding its essential doubleness.

We must now consider each of these shifts more closely. First, the duality of departure points. What is the precise status of each of them? Two elements deserve to be emphasized. Initially, both of them have a function of inauguration. On the one hand, the Greek morning sets in motion a particular question which, from Plato on, will be forgotten. However, on the other hand, the Platonic act not only stands in relation (misrepresentation) to what goes before it. To the extent that what precedes it was never thought, this act too has an inaugural status. We thus find ourselves in the presence, not of one initial time and of a simply derived stage, but of two initial times. Second – and paradoxically – the one (Platonic ontology) is closely dependent upon the other (the initial setting in motion), since it is only constituted by the recuperation, in the mode of a recovering, of the former time. In this sense, it has a secondary or derived position in relation to the other.

How can we reconcile these two aspects? In other words, how can we explain the fact that Platonic ontology is secondary, while being, in a certain sense, primary? How can we claim that one time is derived from the other without falling back upon the linear illusion, the metaphor of the line (which would eliminate the inaugural duality)? There is only one solution and it is the one Heidegger adopts: he affirms that there are two departure points, but they do not have the same status. The one has an original status, the other only a derived status. The one inaugurates our destiny, though we still cannot define it as the beginning of

thought (since it does not belong to its order), while the other inaugurates the history of thought, without being the source of what is destined to be part of it.

Hence, what we see becoming clearer, in what at first appeared to be a simple doubling of the departure point, is a gap between an unthought origin and a thought beginning, a gap that does have a hierarchy, since the one finds its truth in the other. It is in the light of this doubling and this gap that we can consider the second consequence, i.e. the dissociation of history.

First, the doubling. If, from Heraclitus to Plato, we find not so much a debate about the same question as rather the setting up of two distinct registers of questioning, we are dealing with a double derivation. On the one hand, that of manifest history, that of the directing question (*Leitfrage*): it begins with Plato, and is brought to a high point in the work of Nietzsche, is called metaphysics and is interpreted, in its truth, as the history of the beingness of being. On the other hand, there is a secret history, that of the fundamental question (*Grundfrage*): it begins with the first Greeks, escapes from thought in the very act of its first emergence and is only recollected with Heidegger. It is called the history of being and is interpreted, in its finally unbound truth, as the history of a withdrawal.¹²

Second, the gap. All that has been said up to this point only makes up a first presentation, necessarily temporary. For, in reality, the history of metaphysics is itself, throughout its long development, the history of being. In these conditions, is it possible to sustain the argument that we are dealing with two derivations? Yes and no. No, in the sense that there is in fact only one line. Yes, however, in the sense that this line, in its own particularity, is a Fold, and that it more than allows, namely actually requires, two registers of decoding: our history can be considered in the light of the thought (history of metaphysics) or of the unthought (history of being). Why can we not dispense with this folding? Because it is only by a folding that the line, in its unity, finally becomes thinkable: our history can only be explained in the order of the thought on condition that it is returned to the order of the unthought.

Between these two registers, where does Heidegger stand? At the very heart of their conflictual unity. He is in fact the one who, because he knows how to distinguish, can articulate. In Heideggerian terms: the one who, because he can recognize Difference, can think it as unity.¹³ This leads us to a third consequence, parallel to that noted during analysis of the first period. The question was the following: how does Heidegger define his own position in relation to history? In order to measure the course thus far, let us recall the answer that was given at that time. History still being conceived of in a unequivocal manner, Heidegger located himself then in continuity with it, i.e. within the direct line of

ontological questioning. However, in order to pursue the same question further, he had, on the one hand, to return to his point of departure (the 'reminiscing' about what had formerly been considered as the beginning, i.e. Plato/Aristotle), while, on the other hand, he had to examine the latter 'in depth' and in a line of thinking inspired by Husserl's phenomenology.

In relation to this first picture, the second period carries out a triple shift. First, the critical work done on Platonico-Aristotelian conceptuality can no longer be termed 'examination in depth', because it requires a leap, a passage to another register. Second, this 'leap beyond' does not touch a more fundamental stratum in the order of meaning, but a more original inscription in the order of history: it takes us back toward the other departure point and this is why it is called the *Schritt zurück*. Third, and finally, since this other departure point never belonged to the order of thought, it can no longer be a question of 'reminiscing' about a 'beginning' (even if earlier than the Platonico-Aristotelian beginning aimed at during the first period), but rather of the 'commemoration' of an 'other beginning' (*Anfang*, and no longer *Beginn*). Briefly: what was formerly conceived of as a movement back to the foundations of Platonico-Aristotelian conceptuality now becomes a step back in the direction of the origin.¹⁴

A certain number of other consequences follow from this, consequences which it is best to interpret in the light of those already brought out in the analysis of the first period. First of all, the task of thought. In line with the movement of examination in depth (of the Aristotelian scheme), it was formerly defined as 'realization' (of metaphysics). In line with the movement of the *Schritt zurück* (in the direction of the Greek morning), it is now defined as *Andenken*. It is no longer the conclusion of a question already asked at the beginning, but rather the recollection of another question, unthought from the origin. This definition of thought as memory signals in two directions at the same time. First, while the idea of a culmination indicated that it was a matter of taking a question asked (if insufficiently elaborated in the beginning) further still, the idea of a recollection indicates that it is necessary to return to a question that was never asked as such, even if it came from even further back. This first connotation of the term recollection would thus respond to the question: what must one think? However, on the other hand, the idea of a culmination also indicates that this insufficiently elaborated question allows for a more satisfactory examination, that it could (and must) be brought to the clarity of a concept, i.e. be made the object of what *Sein und Zeit* termed an 'explicit elucidation'.¹⁵ The idea of recollection indicates that this unthought origin toward which one must return can never be grasped, discovered or uncovered, with regard to what it 'is': one can only remember it, or better still, commemorate it, within a 'faithful

thought'. This second connotation of the term recollection would thus respond to the question: how must one think?

These two connotations are obviously not unconnected. If what one must meditate upon is a trace which thought never conjugated in the present, then this can only be meditated upon in the future perfect. The word 'recollection' says both: it says that what we are to be faithful to lies far behind, at the origins of our history, as something always/already withdrawn, and it says that, in order to be faithful to it, thought must transform itself: it must no longer be the grasping of a substance, not even the elucidation of a meaning, but the recollection of a difference.

There is finally a last consequence – which is also, by right, the very first, and which will enable us to close the circle. The question of being transforms itself. It is no longer a question of bringing to light a unity of meaning given at the same time as 'being'; it is a question of directing oneself toward the darkness wherein it takes shelter, i.e. of remembering that which withdraws. What then does withdraw throughout the long, supposedly unequivocal, history of metaphysics? It is precisely this doubleness and its enigmatic unity. That is, being as Difference.

The end of our analysis thus offers the key to all that precedes it. If the entire second period of Heidegger's itinerary can be characterized by a series of cleavages – and cleavages formerly poorly understood, which Heidegger had to construct patiently – it is because being 'is' Difference – and a difference withdrawn from the start, which encourages its own misunderstanding, thus the obliteration of the cleavages.

III

Is there a third period? That is obviously the question which this new treatment of the subject will arouse. Taking the *Kehre* into account and utilizing it to better bring out the fundamental positions adopted in the course of a life's work, both these processes are based upon an interpretation which is largely underwritten by Heidegger himself. However, to affirm that at the end of his development he would have committed himself to another turning point in which positions adopted during the previous decades would have been placed in doubt or seen as out-dated is certainly running a risk: that of proposing a division which, even if it does run through his work, is never made the explicit theme of it.

I do think, none the less that we cannot pass over this new division and that the outlining of a 'third period' is necessary for several reasons. Necessary, first of all, because of the theme we have developed here. The privilege granted to the Greek morning is often projected upon the ensemble of Heidegger's thought, as if, by making the one coincide with the other, the former could be used to define the latter. We have however

seen that *it had not been clearly outlined* at the beginning of his development and we shall also see that *it had already been set aside* by the end of it. A subtle setting-aside that was not always clearly marked out but for which the main evidence is provided to us by Heidegger himself when he *renounces*, on a decisive point, the interpretation which dominates his work. Of course, he utilized this dominant interpretation for some thirty years in any number of texts. The renunciation comes at the very end and in a few pages. Unless we decide (and according to what criteria?) that certain texts will be taken as determinative for the understanding of a thinker while others will be ascribed to accident or a break in the train of thought, it remains difficult for us to take for granted an interpretation which Heidegger himself did not recognize as his own.

Second, if his view of the Greeks cannot be dissociated from a particular way of locating the beginning, defining history and thinking the question of being (as I have attempted to show for the two preceding periods), then we may presume that such a noticeable change in his understanding of the first Greeks must imply – or indicate – an equally significant modification in the ensemble of his thought. Do the later texts (those of the 1960s) indicate such a modification? It is only by being attentive to the difficulties and discordances which characterize these later texts that we have any chance of resolving the question of this third period. Do these discordances, once clearly set apart, agree with one another? Do they make up a relatively homogeneous setting? And, if this is the case, how can this unity of the later texts be structured in accordance with the other ‘periods’ in Heidegger’s development? It seems to me that one of the tasks of contemporary criticism is perhaps to respond to these questions.

We must not forget that, if Heidegger did not really outline this ultimate unity in its specificity and its difference from the other periods, he did nevertheless grant it a place and a name. Its place is in the collection *Zur Sache des Denkens*, which contains the three most significant texts on the new positions: ‘Das Ende der Philosophie und die Aufgabe des Denkens’ (1964), which corrects and modifies the former interpretation of the ‘Greek morning’, ‘Zeit und Sein’, and the ‘Seminar’ devoted to it (1962), which presents the double question of being and history in a new and quite troubling light.¹⁶ The name which delimits a space for a thinking which is still unexplored and with regard to which it is a question, says Heidegger, of ‘committing oneself’, is *Ereignis*.¹⁷

Let us take up again, point by point, each of the shifts carried out in the course of these last years. The gesture which will mark our point of departure is the re-establishment of the previously interrupted continuity between the pre-Socratics and Plato. It was assumed until then that Plato had initiated a change in the essence of truth, making it move from an uncovering (ἀλήθεια) to rectitude (ὁμοίωσις).¹⁸ More generally, it was

assumed that the 'Greek morning' constituted a privileged time in history when something of being stood out in its own truth and was, at least within the register of experience, perceived as such. But here is what Heidegger writes about ἀλήθεια and the 'change of essence' in truth which was thought to have taken place in Plato:

We must recognize that ἀλήθεια, the uncovering in the sense of the lighting up of presence, is henceforth and exclusively [*sogleich und nur*] to be experienced [*erfahren*] as the rectitude [*Richtigkeit*] of representation and statement. But then, even the affirmation of the mutation of the essence of truth [*von einem Wesenswandel der Wahrheit*] which would have led from uncovering to rectitude, is no longer tenable. Instead of this, we must say: ἀλήθεια, as the lighting up of presence and presentification [*als Lichtung von Anwesenheit und Gegenwärtigung*] in thought and word, happens henceforth [*sogleich*] in the perspective of ὁμοίωσις and adequatio, that is, in the perspective of a conformity [*Angleichung*] in the sense of a correspondence [*Übereinstimmung*] between representation and what is present.¹⁹

This text is rich in information. The dividing line between the initial 'experience' and later philosophy is considerably clouded over. Metaphysics, of course, retains its status as a derived construction which cannot be understood in itself. But Heidegger formerly believed one could discover, in the Greek morning, the 'original' figure. He now recognizes that this figure, in its first blossoming and its very first giving, was already derived, that it was *derived from the beginning*, that there was no original nor any covering over. It is this reunifying of the Greek scene which seems to constitute the basic shift. For the moment, we need to examine the various consequences, as we did for the preceding periods.

The first is that it is no longer necessary to retain the principle of a double *beginning*, one more original than the other. Of course, we must look at something which, in some of its features, still resembles an 'origin'. But no one in history, and no time in history, was close to it. What underwrote and legitimized the distinction of the beginnings was precisely this subtle hierarchy of closeness. Once this has been broken down, it is no longer necessary to retain two points of departure: one having opened in the split second of a lightning stroke, without being recognized or thought, and the other, which took place in the decline of this split second, and which was alone to have a posterity in the order of thought. No longer having the room to develop in history itself (even on the threshold of this history), the inaugural bolt of lightning was never really able to *take place*.

If thus 'the Greeks' are again thought of as a unity, if what happens with Heraclitus is only and immediately (*nur und sogleich*) what will be

made thematic by Plato and will continue until Nietzsche, then the initial complication, belonging to the second period, can be abandoned: occidental thought begins with the very first Greeks; Plato limits himself to continuing them; ontology does not begin anything (not anything, in any case, which is of the order of a break); there is only one beginning and it is an errant beginning.

The second consequence: this reunified beginning results in a *history* which is itself simplified. It is best however to be quite precise here. To speak of simplification does not in any way mean affirming that the Fold would disappear. But what is new is that the hidden side is, to a certain extent, let loose: not having ever reached land, even in the beginning, *it loses its anchor point in history*. Of course, as early as the second period, the unthought was recognized as having always been unthought. But, precisely, it did 'reach land', in such a way that the history of thought was not to be assimilated simply to history as such. Beyond the strict register of thought, there were those of experience (*Erfahren*), of premonition (*Ahnen*), still others perhaps – registers which rightfully belonged to occidental history, which were even dominant in its beginnings (the whole meaning of 'morning') and which allowed the unthought to insert itself, even obliquely, *in this history*. While now occidental history, since its very first opening and in all its dimensions, is played out entirely on *one* of its sides. As for the other side, it remains what must be aimed at or thought, but it no longer overlaps anything which takes place; it does not rejoin any historical trace; it has had no witness – *and thus no guarantor* – in history.

The third consequence: how did Heidegger see himself in relation to history thus understood? As long as the unthought retained its anchor point in history, Heidegger had no need to depart from this history in order to think it. He did indeed need to make a 'leap', but it was an intra-historical one, since he made it by moving back from the derived to the original, i.e. from one beginning to another. The movement played itself out less *in history* than *in relation* to it. It is less a 'step back' than a 'step to the side'. History being entirely grasped as a unity, the person who attempts to think it, i.e. to send it back to its unthought truth, can no longer place himself *in* it. There is simply no room left for him in this history, because there is no trace he can insert himself into.

The fourth consequence: the task of thought, the leitmotif of the lecture of this title²⁰ is that it is now a question of thinking 'the lighting up of presence' (*die Lichtung von Anwesenheit*). Is this a shift in relation to the task defined previously? Indubitably. But this shift cannot be accomplished unless we distinguish the different occurrences of the word *Lichtung* in Heidegger's work. *Lichtung* has only one meaning, clearly defined: it names the unapparent opening whence comes that which is given. But by 'what is given', Heidegger sometimes means the present

or being – and in this case, the unapparent opening from which it comes is presence itself. Taken in this context, *Lichtung* denotes being. In the text we are dealing with, by ‘what is given’, Heidegger means presence or being – and in this case, the unapparent opening from which it comes is an even more initial land. In this context, *Lichtung* no longer denotes being, but the whole possibility of its being given – that is, it exactly matches the semantic field of the word *Ereignis*. To sum up, the word *Lichtung*, which indicates a formal movement of withdrawal of giving, receives a different ‘value’ according to the quality of what is given (and thus of what withdraws): *Lichtung von Anwesenheit* is not synonymous with *Lichtung als Anwesenheit*.²¹

Once this confusion has been cleared up, the task of thought as it is defined in the 1964 text (‘Das Ende der Philosophie’) is no longer distinguishable from the one presented two years earlier in ‘Zeit und Sein’. In both cases, the task no longer consists in thinking being (in order to recognize it as difference) or in illuminating history (as the history of being). It consists in thinking their common origin. Their origin, i.e. *that whence* they were dispensed from being as time, thus *that whence* our history could be what it was. But moving back to this land of giving also makes possible a double gesture, for which it is important to evaluate the link.

(1) The claim that this history, as such, is *terminated*. And this, to the precise extent to which it was carried back to that which granted it. If the history of being is, as Heidegger always said, the history of the withdrawal of presence in its different historical periods, it cannot be sent back to that which formulated this withdrawal without coming simultaneously to its closing. It is thus revealed that the history of being only perpetuated itself through the unthought which it enfolded (and not in spite of it) and that, once ‘illuminated’ it lost at one and the same time its secret and its very drive. Thus the first ‘disturbing’ theme of the ‘Seminar’ is legitimized: that of an end to history.²²

(2) The claim that this history (precisely because it was taken back to its provenance and found its conclusion there) can be *abandoned*. It is in this sense once again that the ultimate ‘step back’ becomes the very first ‘step aside’. Having projected ourselves into the land of the *es gibt*, this makes everything which is derived therefrom thinkable, everything which came under the heading of presence and history of being. But this also allows us to see the broader realm of what is not derived, which remains unknown for us, as well as unnamed. This means that it opens onto the possibility of another thought and perhaps of another future which would no longer be a history. Thus the second disturbing theme of the ‘Seminar’ falls into place: our history no longer constitutes what is to be thought.²³

It is in this context that we may best insert the fifth consequence, i.e., the last position adopted by Heidegger in relation to the *question of being*. In fact, it is only the translation of the preceding double statement. Committing oneself to the land of the *Ereignis* is in effect reaching the 'essential provenance' of being, thus taking it back to its 'ownness' – and it is at one and the same time a way of having done with it. The work of explanation being complete, it no longer has a claim upon us. Hence the third disturbing theme of the 'Seminar': that of a 'taking-leave' of the question of being.²⁴

These two statements (the history of being is finished/it can be abandoned) are not only linked together. They are also articulated most closely with the whole series of 'consequences' which I brought out as characteristic features of the last period. The fact of thinking the *end* of history and jointly its *abandonment* (fourth consequence) has the condition of its possibility in the leap Heidegger made in locating himself *outside* this history (third consequence), a leap having its own condition of possibility in the act through which history, formerly split, was *reunited*, this reunification being entailed by the fact that truth – or its trace – was no longer to be inserted *in* it (second consequence).²⁵

What did these last analyses tend toward? Toward showing, first, that a number of disconcerting statements by the later Heidegger have a unity (i.e. are concordant among themselves) in their reference to *Ereignis*, understood as the realm of donation. Second, that this realm proposes answers – *new answers* – to the ensemble of those questions (the beginning, history, the task of thought and the question of being) which formerly allowed us to recognize different 'periods' in Heidegger's itinerary. Third and most important of all, it is in the light of the differentiation between *Ereignis* and the question of being that it is possible to understand the relation of necessity which unites the third period to the two before it. What is more, the status granted to the Greeks enjoys the status of a *privileged sign* even if it does not possess that of a driving force. It only remains to elaborate upon these last two points.

In the second part, we saw that the division of the Greek landscape went hand in hand with a whole series of splits, themselves contemporary with the central attempt: thinking being as difference. What stands out in the third part is that the reunification of the Greek landscape (taken as the point of departure for the analysis) cannot itself be dissociated from a withdrawal from the ensemble of divisions, itself contemporaneous with a new attempt: 'diverting the focus of being'²⁶ (therefore of the difference).

The passage from one period to another thus appears in its necessity. What happens at the end of his work and explains all the shifts we have followed is that the question – i.e., also the task – is henceforth elsewhere. What was divided can be withdrawn under the heading of unity,

because what is to be thought now is the *relation* between this re-established unity and its possible *outside*. In clear terms: what is to be thought is no longer the difference between being and beingness, but the relation between being (which *is* only through its difference to beingness – though it is no longer this which is being insisted upon) and its giving; no longer the difference between metaphysics and the thought of being but the relation between the thought of being (which alone can elucidate metaphysics – though this is no longer what is being insisted upon) and another thought. What is the condition for such a change? I shall propose – with caution – that it consists in the fact that Heidegger, no longer seeing any privileged time in history, can henceforth distance himself from it and consider it as an ensemble.²⁷ And what is its consequence? It is that the relation between this ensemble and its other, that is, between a unity and the outside from which it comes (and to which it can be led back), can become a question. It is indeed this question which moves to the very centre (under the auspices of the term ‘giving’) when thought ‘commits itself to *Ereignis*’. That is, *Ereignis* elucidates not only the internal coherence of the third period but also its insertion into the ensemble of Heidegger’s itinerary.

In these pages, I have attempted to outline a double curve of development. Along the first, we find the little history of the Greek morning with its triple status: first understood as the beginning (hesitant) of what Plato and Aristotle will raise to full conceptuality, then as a starting signal (decisive) for a question that ontology will condemn to forgetfulness, finally as the beginning (henceforth without glory) of this forgetfulness itself. The history of the Greeks in Heidegger’s works is thus that of a unity broken and then re-established, but re-established after an overthrow: if Plato appears in the beginning as a continuation or realization of the pre-Socratics (in the register of truth), at the end, it is the pre-Socratics who appear as a prefiguration of Plato (in the register of misunderstanding).

On the second curve, we find the great history, History itself as it can be grasped through Heidegger’s triple project: first to continue it by delving into it, then to elucidate it by recollecting it, finally to abandon it, by taking leave of it. For me, the principal interest in the outlining of these two curves lies in their articulation: because the one closely adheres to the other, follows it in each of its movements, we are able to bring this movement to light.

However, this revealing is not without danger. By elucidating – in a light which we can justly call relatively stark – Heidegger’s positions, I have partially altered their nature. Left on their own within the text where they had their being, their outlines were not so keen nor their

contrast so marked. By emphasizing, as I have done, the breaks in the itinerary, I have betrayed the continuity. For there is indeed a continuity. Heidegger always moves along the same path, a path one can (and must) grasp as a unity. It is none the less true that this unity is not simple, that it has 'stations' – stations which one can (and must) bring to light as well. This obligation is all the more impelling in that Heidegger, at the end of his life, made an attempt at an auto-interpretation under the heading of unity: emphasizing the continuity of that preoccupation which led him from Brentano to Trakl, or the persistence of the question leading from *Sein und Zeit* to 'Zeit und Sein'. This is a possible (and accurate) light to see it in, but it is not the only one possible, nor the only one that is accurate. For Heidegger's itinerary is at once continuous and discontinuous. By insisting as he does on the unitary aspect, Heidegger left us to come to terms with the differences, without himself carrying out the work of differentiation. It is up to us to take this on, that is to outline the limits that were not immediately evident. As my objective was to make them intelligible, I was forced to *exaggerate* them.

This objective having been at least partially achieved, it remains for me to undo what I have been doing throughout these pages – to recall that the duality of the question was already sketched out as early as *Sein und Zeit*, that the going beyond presence, accomplished in *Ereignis*, was already played out in the very thought of presence as it was developed in the heart of his works; that, in one or other of its dimensions, *Ereignis* is the *accomplishment* of the question of the truth of being which is itself closely contiguous with the question of the 'meaning' of being, etc. Thus, Heidegger's itinerary does not strictly include – except for purely occasional questions – *changes in course*. It does however include, in the strict sense, *turning points*, places where the path curves inward, where the direction is modified and refined, without truly recanting – but in finding its end elsewhere and otherwise. The Greek morning which the prophetic Heidegger neglected at first and which he later sought out and recognized as blind, formed here the site of a *topography of turning points*.

Translated by Cozette Griffin-Kremer

Notes

1 Cf. *Heidegger et les paroles de l'origine* (Paris: Vrin, 1986).

2 The volumes presently available are volumes 20, 21, 24, 25 and 26 of the *Gesamtausgabe* (GA).

3 *Sein und Zeit* (SZ) (GA 2), §6, p. 22.

4 Cf. *Die Grundprobleme der Phänomenologie*, GA 24, p. 453 (French tr., p. 382). Heidegger confirms here that 'at the beginning of ancient philosophy',

being is still taken as beings, that is, 'explained with the help of ontic determinations'. And he adds: 'This way of interpreting being will remain current for a long time in Greek philosophy, even after the decisive progress brought about by Plato and Aristotle in the posing of the problem'.

5 SZ, §1, p. 2.

6 For this double movement the *Logik* (GA 21) should be consulted. Also, *Die Frage nach der Wahrheit* (GA 21) and *Die Grundprobleme der Phänomenologie*.

7 A claim which obviously has to be qualified. If a question is posed in another manner (in a more radical manner etc.), is it still the same question? Without pretending to be able to resolve this question here, I would like nevertheless to propose several components of a reply. (1) It is indubitable that the question of the 'meaning of being', posed in *Sein und Zeit*, is *already more* than that characteristic of ontology, namely, of the 'being of beings' (even if the latter is envisaged from the standpoint of a unity of signification). (2) It could be however that is *not yet* that of the 'truth of being', characteristic of the later texts. (3) Between this 'already more' and this 'not yet' there reigns a difference of *radicality*. It has to do with the fact that in the movement of the 'already more', the word 'being' keeps its earlier meaning – which it loses, by contrast, in the execution of the 'no longer'. What I mean is that what is decisive in the transition from the problematic of 'meaning' to that of 'truth', is that 'being' no longer says the same thing in the one expression as in the other. When Heidegger was pursuing the meaning of being, it was a matter of that being furnished by ontology, even if its meaning, as well as the horizon of this being, was not made explicit by it. When he starts to pursue the truth of being, it is a matter of that being which reveals itself to ontology, and of which it has never spoken, which it never even succeeded in envisaging – the history of thinking then being recognized as envisaging, under the name of being, a different question altogether, namely, that of the beingness of beings.

If these distinctions can today be drawn more finely, it is evidently on account of the publication of the lectures. Previously we were obliged to read the first eight paragraphs of *Sein und Zeit* in the light of writings subsequent to 1930. So naturally we were inclined to project upon it distinctions which, while being certainly pre-figured by it, were however not operative in it. The interest of a text like *Grundprobleme der Phänomenologie* is precisely that of having permitted this to appear in another light.

8 J. Taminiaux, 'Heidegger et les Grecs à l'époque de l'ontologie fondamentale', *Etudes phénoménologiques*, No. 1, ed. Ousia, 1985.

9 We may note that publication of the Marburg courses is quite recent – and still unfinished – and that the texts from the later years, perhaps due to insufficient distance, have remained fairly little analysed by current criticism.

10 Naturally, it is also because he reads the pre-Socratics, and so on. I do not claim to propose a universal key, but am trying simply to bring out *one* dimension of explanation by putting this split back into the horizon of necessity which can, at least partially, give some account of it.

11 Cf. for example *Vorträge und Aufsätze* (Pfullingen: Neske, 1978), p. 221: 'Once, however, in the beginning of Occidental thought, the essence of language burst forth [*aufblitzte*] like a flash of lightning in the light of being. . . . But the flash of lightning went out suddenly.' And, a few pages later (*ibid.*, p. 237), Heidegger takes it up again: 'This first lighting up of the essence of language disappeared immediately, it was covered over.' Taking only the example of the word *logos*, it would be easy to show that, for Heidegger, *all* the 'fundamental

words' (*physis*, *alétheia*, *eon*, etc.) also burst forth in light only to go out immediately.

12 For the distinction *Grundfrage/Leitfrage*, cf. particularly *Einführung in die Metaphysik* (1935, GA 40), as well as *Vom Wesen der menschlichen Freiheit. Einleitung in die Philosophie*, GA 31.

13 i.e. think it, not as a simple *Unterscheidung*, but as an *Austrag*, a term for which Heidegger asks us to understand both the differend and its conciliation. For the development of this terminology (and this thought), see particularly: *Identität und Differenz* (Pfullingen: Neske, 1957), p. 63 and *Unterwegs zur Sprache* (Pfullingen: Neske, 1975), p. 25.

14 Of course, it is understood that the origin in question here is not only in history: it stems from the scheme (transformed, for that matter) of the 'foundation'. In exactly the same way, the *Schritt zurück*, mentioned above, is not only a step backwards in history: it also stems from the scheme (transformed) of 'examination in depth'. I am not affirming at all that we move here from one order (of meaning) to another (of history). I am saying that henceforth the two move together and that it is precisely this conjunction which was absent in the first period.

15 SZ, §2, p. 6.

16 *Zur Sache des Denkens* (Tübingen: Niemeyer, 1960). The collection also contains the short text entitled 'Mein Weg in die Phänomenologie', 1963. It is understood that the later period is not limited to the texts cited. However, if it is brought out in a number of other texts, it is in these that it is most clearly made into a theme.

17 I have shown elsewhere, in a comparative chart of different occurrences of the theme (*Heidegger et les paroles de l'origine*), that *Ereignis* is certainly named in earlier texts, but that is only properly thought out during the decade 1950–60, and is only fully explicated at the end of the decade and the beginning of the next.

18 'Platons Lehre von der Wahrheit', *Wegmarken* (Frankfurt am Main: Klostermann, 1967), pp. 135–9 (*Qu. II*, pp. 152–5).

19 'Das Ende der Philosophie und die Aufgabe des Denkens', in *Zur Sache des Denkens*, p. 78 (*Qu. IV*, pp. 135–6).

20 'Das Ende der Philosophie und die Aufgabe des Denkens'.

21 This structure is developed by Heidegger himself, but in another text and with regard to another term: that of 'letting'. There he distinguishes the two acts of 'letting the present happen' (to the presence) and 'letting presence happen' itself. The distinction is clearer in German, where one can follow the passage from the pair *Anwesend/Anwesen* (characteristic of his 'mature' works) from the pair *Anwesen/Anwesenlassen* (characteristic of later texts). Cf. 'Zeit und Sein', in *Zur Sache des Denkens*, p. 5 (*Qu. IV*, pp. 18–19), as well as the corresponding commentary in the Seminar, *Qu. IV*, pp. 39–40 (69–70).

22 'Seminar über den Vortrag Zeit und Sein', in *Zur Sache des Denkens*, pp. 44–5 (*Qu. IV*, p. 75). For the analogy on this point with Hegel, cf. *ibid.*, p. 53 (87).

23 *ibid.*

24 *ibid.*, p. 58 (93).

25 That is, the very last hypotheses of Heidegger would simply be impossible – even impossible to envision – within the scope of the second period alone to which the ensemble of Heidegger's itinerary is often reduced. One does not abandon that which one holds oneself within; one can only elucidate it differently on the basis of a new perspective made possible by the place occupied in the

space of the within. However, if one is outside, it is the whole of the territory which may be neglected at the same time that it is circumscribed. To sum up, if Heidegger was able to envision the exploration of an 'elsewhere' at the end of his work, it is because he was already there.

26 'Zeit und Sein', in *Zur Sache des Denkens*, pp. 5–6 (*Qu. IV*, p. 19).

27 But have we here really the condition or simply one of the dimensions of the change? I admit I do not see this very clearly.

Reading and thinking: Heidegger and the hinting Greeks

Kenneth Maly

The scope of this presentation is a gathering of reading, thinking and hinting in their evocative possibilities – possibilities opened up within the work of thinking that we call ‘Heidegger’. The early Greek context for this presentation is twofold: Anaximander and Parmenides. The textual context is threefold, three texts of Heidegger’s: ‘Der Spruch des Anaximander’ (called ‘The Anaximander fragment’ in English translation) from *Holzwege* (GA 5), *Grundbegriffe* (GA 51) (whose last section is devoted to Anaximander) and the short text on Parmenides and the ensuing discussion in the ‘Seminar in Zähringen 1973’ from *Seminare* (GA 15).¹

Specifically, the work of thinking attempted here is a weaving of reading, thinking and hinting into and out of those three Heidegger-texts, then a weaving of the texts on Anaximander with the text on Parmenides and finally a weaving of the whole problematic of ‘being’ as it unfolds from out of the questions of reading, thinking and hinting – as they are probed, tested and tried at the fire of this first beginning with the early Greeks.

Thus this presentation, in the process of its unfolding, will be of service to two issues of paramount importance to Heidegger-scholarship at the present juncture in philosophy, exactly one hundred years after his birth: first, by engaging the core issues of Heidegger’s thinking in terms of texts that have appeared in the *Gesamtausgabe*, it participates in that thorough and in-depth reinterpretation and reappropriation of Heidegger’s works that is called for by the ongoing publication of the *Gesamtausgabe*. Second, by engaging texts from different years in Heidegger’s life-work and by letting the one question that runs through all of these texts be seen in its several hues, it shows the ongoing unfolding in the turns and turnings in Heidegger’s work *from within the texts themselves*, rather than from the perspective of textual hermeneutics, comparison of texts, or commentary *on* these texts.

This presentation is not intended as an external commentary on Heidegger's thought – thus commenting *on* Heidegger and then either dividing his thought into 'periods' or placing his thinking here or there within the history of metaphysics. Rather, it wants to go underneath such commentary, underneath to the subtle but very forceful evocation to the matter for thinking (*das Zudenkende*), which is always the same (even a unity, a one?) and which a proper reading of the texts opens up.

This presentation unfolds in a series of imagings, imagings that image or show or let be seen the question that is imaged in the imagings. And finally, since *what* gets imaged in the imaging is always the one question (the question of being/disclosure/self-showing), the imagings are always imaging being as self-showing. Since being as self-showing is itself an imaging, this presentation is a series of imagings of imaging itself.

First imaging: the place of opening

That place where the question opens up for us – what is it? Where is it? How to name, provisionally, that place where the question carries with it and within itself its own energy (*energeia*) or work?

In *Grundbegriffe* (GA 51) Heidegger portrays an unavoidable and unresolvable tension, the tension whereby on the one hand being (or the 'is') is, while on the other hand every attempt to think that being results in its being transformed into a being. Although being is somehow other than beings, when we think 'being as such', we end up thinking it as *a* being, turning everything upside down, perverting, inverting, turning everything topsy-turvy – putting a misleading and inappropriate shape to the question.

In Paragraph 17 of *Grundbegriffe* Heidegger says this place of tension, of unresolvability, in several ways:

- (a) We stand between two equally unsurpassable limits: On the one hand, insofar as we think and say 'being "is"', we immediately make being into a being and thereby deny the proper work (*energeia*) of being. *Being gets disavowed by us*. But, on the other hand, as long as we experience beings, we can never deny the 'being' and the 'is'. (GA 51, p. 80)
- (b) On the one hand being cannot be gotten around; on the other hand, when entered into, being gets immediately made over into '*a* being'. (GA 51, p. 81)
- (c) In every attempt to think being, being always gets turned the wrong way and changed into *a* being – and is thus destroyed in

- what it is in its core. And yet: being in its otherness from beings (being other than beings) cannot be denied. (GA 51, p. 82)
- (d) Being shows itself to be both at the same time: it is put forward as unavoidable and indispensable, even necessary – and at the same time incomprehensible and ungraspable. (GA 51, p. 82)
 - (e) [I add here a quotation from *Introduction to Metaphysics*, where the same tension is expressed]: The word *being* is undefined/indefinite [*unbestimmt*] in its meaning, and still we definitely [*bestimmt*] understand it. ‘Being’ turns out to be (shows itself as) something highly definite, but totally indefinite, undefined – even ambiguous.²

The place of opening, as portrayed and laid out here, is that place where being both is and is not graspable, where being cannot be denied and at the same time gets thought as itself *a* being – and thus no longer itself: being as such – where being is disavowed and at the same time undeniable.

From the point of view of logic, this place is one of contradiction – and often gets dismissed for its impossibility. In dismissing this place, logic renounces and then loses being and its domain. (The uncanny part of this is that this renouncing, which is at its root a loss, gets taken as a gain. ‘Reality’ is simplified, manageable – and its managers are more secure – within this renouncement. No wonder that they blindly call this loss a gain! (cf. GA 51, p. 40).) The discipline of logic will never enter into this domain.

We are presented here with an aporia, a place that is difficult or even impossible to pass through. The mode of metaphysical thinking is to think *about* this aporia, only to realize that there is no way out.

What Heidegger proposes and evokes is a different way of thinking: not thinking as thinking *about*, but thinking as expanding into, having a genuine root connection to this aporia, not as a ‘no way out’, but rather as what is worthy of thought (*denk-würdig*): what calls for, requires, draws forth thinking.

Gathering up: the place of the opening of the question is the aporia (no way out) of being’s always getting turned into *a* being, or of being’s being unavoidable and intrinsic to what is and at the same time being incomprehensible in its ‘is-ness’. Rather than thinking *about* this aporia, we are called to expand into the domain of being in its aporetic and unresolvable character.

It might seem as if what we are describing here is a refined and more subtle shape of the ontological difference. But it is utterly different. Although the words used and the grammar may *seem* to be about the ontological difference, what is being said is in a dimension that is fundamentally *not* that. This can be seen in two ways: first, the being that is

spoken of here (speaks itself) is not the being *of* beings – it is not the difference between beings and the being of those beings. (We will see later that the very word *being* is unsuited for saying this region/domain.) Second, what is opened up in this unresolvable matter/*Sache* is not a difference at all. There is no difference here, even though language and grammar differentiates. Thus I would suggest not using such words as *discord*, *dispersal*, *dichotomy* – or even *difference* – to name this place of opening. This *Sache* in its unresolvability cannot be named *difference*, however one spells or pronounces the word.

Rather it is an opening. At work is an expanding. This gets heard in the *energeia* of the opening. What is called for is a language that says this domain in its folding and unfolding, in the movement that it carries *in itself*. What is called for is to see the aspects and shapes of the tension in the imaging of weaving and nuance rather than in any imaging of juxtaposition or opposition.

Second imaging: entering into the clearing of being

How to enter the question of being, the domain of being? Given that the place of opening is aporetic, *how* does thinking expand into this aporia?

The tension that we have just described in the first imaging – namely that being, in every attempt to think it, gets turned or perverted into a being, thus losing its root character, while at the same time being as other than beings cannot be denied – appears to logical thought as a contradiction or paradox. We, on the other hand, must try to go all the way into the tension of the two ‘equally unsurpassable limits’, into the tension of being’s being unavoidable *and* incomprehensible, into the definite indefiniteness of being, into being’s otherness even as it is always thought as not other than beings, into the tension of the unresolvability.

The word that Heidegger uses for this ‘going all the way into’ is *erfahren*. We usually translate *erfahren* as ‘to experience’. But simply to render *erfahren* as ‘experience’ carries two risks: (1) that we in our thinking will miss the point of this deep penetration or entering into the dynamic of this tension and (2) that by using the English word *experience* we fall prey to a dimension of interiority or subjectivity that the word carries with it in its usual connotation as well as in its etymology from the Latin.

If we take the word *erfahren* back to its roots, we find the verb *fahren* – to travel, to wander; to let go; to ride; to move, go, travel – and then the prefix *er-*. *Er-* has a root connection growing out of the prefix *ur-*, referring to origin or source. *Ur-*: from the source or origin, out-and-

out, thorough, through-and-through. With this connection *er-* means: all the way into, into and out of the origin. Thus *erfahren* means:

to get by going through
 to go all the way into/through
 to move/pass through
 to be drawn through
 to become versed in
 to let go into.

Erfahren means 'to experience', but in the deeper sense of going all the way into and being thoroughly *in* the *Sache*.

Heidegger says that we need 'to go all the way into [*erfahren*] the situation that, placed between the two limits, we are delivered into a unique situation or place from which there is no way out' (GA 51, p. 81). Thus thinking's way into the question is to get all the way into and to stay with the fact that there is no way out of the question. This 'no way out' (*Ausweglosigkeit*) or impasse presses upon us in a twofold manner: (1) how the question or domain of being is both unavoidable and incomprehensible, how we are called to think being in its being other than beings, even as we always think it *as a* being and (2) how, once our thinking has entered this domain, there is no way out. (Again, logic will not help; for it gets out by jumping the fence!)

In presenting the unresolvability of this question, Heidegger opens up a pathway with several clues or steps as to how we in our thinking might enter into this space of unresolvability.

(1) 'this extreme "no way out" might come from being itself' (GA 51, p. 81). 'Being itself unfolds in such a way that *it* brings . . . thinking into this "no way out" ' (GA 51, p. 82). Our entry into the unresolvability is granted by being itself as it emerges in the dynamics of unresolvability. (2) One possible response is to close our eyes to the aporia. Another possible response is to eliminate the aporia by disallowing the question of being. But there is a third possibility: to move into and to stay with the 'no way out' situation abandoning all haste to get out of it (cf. GA 51, p. 82).

Being has cast itself upon us as the 'light' by virtue of which beings appear and get seen. We cannot fight against or refuse this casting of being – nor would we want to, Heidegger says. But at the same time being withdraws when we try to say it – and we are left only with beings. This continual tension is our proper dwelling place; its name is *Da-sein*.

Thus, by staying in and with the 'no way out', we find that, as humans thinking, we are left in a region that simply has/is this utter openness, dynamically in tension. In this context Heidegger says: 'In a strange sort of way being has exploded our own *human essence*' (GA 51, p. 89).

(3) Staying within this domain of unresolvability, the 'recollecting of

being (gathering oneself unto being) is remembering or becoming wakeful to the first origin of Western thinking. This remembering or being wakeful to the first origin is a preparatory thinking [*Vordenken*] into the more originary origin' (GA 51, p. 92). This preparatory thinking needs to be *unbeeilt*: unrushed, needing its own time (not the hasty moving quickly from one thing to another). It also needs to be *ungerahmt*: unframed, not de-fined, needing its own opening and expanding (not the limitation of the space of positions or niches, as in 'this niche' and then 'that niche'). This remembering is being transported into the being itself which still unfolded in that origin and which always still unfolds, even when thinking's focus is on beings alone. Thus being in its originary character is always close to us – as close as can be. Therefore, what seems like being transported *into* that domain is really only remembering and being awake to our being always already there.

(4) To be awake to, being within or expanding into the domain of 'no way out', is to be gathered into being. This 'being gathered into' is, very simply and in each case, a transformation (*Wandlung*) in our way of being. This transformation needs beforehand a preparedness, the state of being prepared (*Bereitschaft*). This preparedness needs beforehand a preparation, getting prepared (*Vorbereitung*). This preparing needs beforehand an attentiveness (*Aufmerken*). Finally, this attentiveness needs beforehand that first reminder of being (*erste Erinnerung in das Sein*) (cf. GA 51, p. 93). All of this remains anticipatory.

In the *Spiegel* interview Heidegger said that this preparing a readiness is really all that we can do. Thinking is awakening the preparedness of awaiting. Central to this awaiting is the character of the domain as showing to those who stay with it that being reveals itself as what we precisely feel the lack of. It shows that we carry a want, we miss something. (Think of *Angst* in *Being and Time*.) Heeding this want – or what we miss – brings us into the simple and straightforward way of a region that is not beings-oriented (cf. GA 51, pp. 4f.).

The dynamics of tension are always at play. The thinking called for in this dynamic, in the claim that it makes upon us in our thinking, is not logical or rationally oriented. It is an other thinking. This other thinking might awaken and clarify this preparedness.

But what kind of thinking is this?

Third imaging: from dialectical to tautological thinking

In a little piece called 'Zeichen' (first published in 1969 in the *Neue Zürcher Zeitung*, now in *Aus der Erfahrung des Denkens*, GA 13) Heidegger writes:

The method of dialectical mediation misses the phenomenon. . . . By itself keen wit cannot get to what still withdraws from our thinking. . . . Dialectic is dictatorship over the unquestioned; and in its net every question is choked off [stifled, smothered] and suffocates.³

Dialectical thinking is the thinking that we in our epoch have to deal with. With Fichte, Schelling and Hegel – prepared for in Kant – Western thinking reached its pinnacle in dialectical thinking. In the historical unfolding of Western thinking, ‘thinking becomes knowingly dialectical’.⁴ But dialectical thinking misses the phenomenon, does not keep open the question that root thinking persists in.

How can we move all the way into (*erfahren*) dialectical thinking – which is the thinking of our historical unfolding – such that it gets shown to be in need? How can we move all the way into dialectical thinking such that our ‘experience’ expands into and calls for another thinking?

What is dialectical thinking? When thinking becomes dialectical, it enters that realm ‘within which it can think itself completely’.⁵ Thinking thinks itself, mirrors itself to itself, is reflective. This can be seen by looking at how dialectical thinking alters the traditional principles of logic. In dialectic the principle of identity, $A = A$, takes on a new dimension. For dialectic $A = A$ has to be more than simply a static identity, an identity of something with itself that cannot be unfolded further. Dialectic introduces something *more* than that. Thus Hegel in the *Science of Logic* writes: ‘There resides in the *form of the proposition* in which identity gets expressed *more* than simple abstract identity.’⁶ In order for A to equal A , there has to be a setting up of an opposite. This leads to contradiction, but now not simply *formally* logical. Rather the contradiction is itself in motion and sets in motion. This movement is essential for the unfolding of spirit. Hegel writes in the Preface to the *Phenomenology of Spirit*: ‘Spirit achieves its truth only in that it finds itself in the absolute split (i.e. contradiction).’⁷

This dialectical thinking is self-enclosed. By being a thinking that thinks itself, is self-reflective in an absolute sense, dialectic cannot reach the strange and estranging character of the unresolvability of the being-question. It cannot reach what is proffered in the phenomenon and that which persists as questionable.

In dialectical thinking reason defines identity, not taking into account movement or transformation that goes beyond it. In dialectical thinking change gets explained in an infinite series of *positions* – one and then the other (as is ‘logical’). As self-enclosed, dialectical thinking takes on a superiority, residing in the subject. In this superiority and priority, given to itself by itself, dialectical thinking shows itself to be in the calculative mode in its heightened form. Dialectical calculative thinking, finally, overpowers human beings, driving them back from their core-

being and reducing them to orderable and disposable items in the 'resource-bank' of the way of 'technique' – disposables within the age of *Ge-stell*. In this domain the flight from another, non-calculating thinking has become hardened (hard and fast) and thus institutionalized.

What is called for in the unresolvability of the being-question, in the thinking that is called to respond to the aporia, in the going all the way through and into unresolvability, is another way of thinking. What is called for is a thinking that thinks the movement or *energeia* in the aporia of being, but not as an oppositional movement. What is called for is a thinking that does not go back and forth between differences, but one that expands into the clearing of the onefold of being in its own unique movement. What is called for is a preparation for preparedness for transformation – awakening the preparedness.

In one of the very last pieces of writing by Heidegger, the short text on Parmenides that he read during the Seminar in Zähringen in 1973, Heidegger names this other kind of thinking: tautological thinking.

Τὸ-αὐτὸ-λόγος.

The Greek word αὐτός means generally: self, the very one, the same. Within these general meanings are hidden some other meanings that open up what tautological thinking might be. Αὐτός also means: of itself, natural, not made. Αὐτός sometimes has the character of the whole, taken together, as in αὐτόρριζος, roots and all. Αὐτοῦ means: in this very place, on the spot, the core movement. Αὕτως means: even so, just as it is.

In speaking of being (εἶναι), Parmenides, Fragment VIII, 29, says: 'ταῦτόν τ' ἐν ταυτῷ τε μένον καθ' ἑαυτὸ τε κεῖται': the self-same, together with itself, just as it is in this very place, is situated within the core movement/tension of itself.

The thinking of τὸ αὐτό is tautological thinking, a thinking that stays with the self-same movement/*energeia*, together with itself. We say that a tautology is a redundant saying, one that repeats the same. Ταυτολογέω: I repeat the said, or: I say the same. Ταυτολογία is a repeating of what was already said. But what happens in the repetition?

It is a saying over again what has already been said. It is a seeking again (*re-peto*) what has already been sought. It is doing over again.

Τὸ αὐτό λέγειν is to say/gather up the same as before, in common, a sharing, in the same place. Emphasis is added in the repeating saying, but the question and its place are the same.

Tautological thinking is precisely a thinking that not only does not demand proof, but is outside the realm of proof. It thinks the same movement/*energeia* that is, together with itself, in the very place where it is the same with itself.⁸

To move from out of dialectical thinking into tautological thinking is *not* a turn or return to identity or unity. Dialectical thinking injected

movement and *energeia* into the principle of identity that it inherited from Aristotle. Still, however, dialectical movement duplicates identity in its very opposition to it, by being self-enclosed and by keeping and enhancing the *positions* in and from which it operates. Tautological thinking does not renounce the movement of difference, but sees another, deeper movement – not merging differences, but thinking from a space where the difference-character of differences does not hold/bind/determine its own unfolding. (Thus tautological thinking *does* call into question the *irreducibility* of difference.)

In tautological thinking and saying there is lack of positions and of certainty. The words of semantic/logical consistency yield a certain certainty, but the imaging of tautological thinking extends and expands beyond the words, always to a 'more', an excess. That excess images the no-position, always ongoing and expanding, of being.

Rather than dialectical, this thinking moves in terms of the preciseness of a point within space, in terms of the point of focus/attentiveness within the expanding opening, in terms of the self-unfolding of the one/same within ongoing connectedness/gathering.

The question remains: is tautological thinking legitimate? Wherefrom does it take its bearings? What is its measure? The single response is: from being, of course. But with the transformation in the shape of thinking, there is a concomitant transformation in the way that being gets said. Along with the move from dialectical subjective thinking to tautological thinking – and part and parcel of that move – is a call for *re-naming* the question of being. This re-naming stems from the ever tighter and more rigorous binding that binds a thinker to the same. In the *Spiegel* interview Heidegger says: 'All great thinkers think the same – this same is so essential (deep) and rich that no single thinker accomplishes (exhausts) it; rather every thinker is bound even tighter and more rigorously [*strenger*] to it.'

Fourth imaging: re-naming the question of being

In persisting in the question of how to enter into the clearing of being, a return to the beginning or origin is called for. In the Seminar in Zähringen Heidegger says:

As I see it, the entry into the root domain of Dasein . . . that entry which would enable going all the way into [*die Erfahrung*] standing within the clearing of being, can take place only with a return, in the form of a detour, to the origin.

(GA 15, p. 394)

Heidegger sees this same, this deep, rich and enriching same that all thinkers are so rigorously bound to – this place of opening, the unresolvability of the ‘no way out’, being situated in the ‘no way out’ regarding thinking being in its suchness (i.e. the enigma that being, when thought, gets perverted into *a* being) – as that hidden dimension that lies underneath all shapings of Western philosophy and functions as the sustaining origin of all these shapings. Thus Heidegger’s thinking returns to the first beginning with the early Greeks, with the provocation that thinking carry a way of being that is *not* reduced or perverted.

Within the network of the historical transformations of being, there is indeed a kind of lineage of being; there is historical variation. However, the question: why did being unfold in a certain way and not in another – or: what ‘caused’ this particular unfolding – is not answerable. But in *each* shaping of the unfolding, reflection can take us back to the original (*das Anfängliche*) – not to retrieve what was then, but to respond to it from here, to think it in its ‘futural’ sense, i.e. as coming upon us (*das Zukommende*).

How is this re-turn (turning back) to the first beginning with the early Greeks possible and appropriate? This re-turn takes place within an echo. It ‘takes place as that hearing which opens itself to the sayings[s] . . . [of this first beginning] from out of our era’ (GA 15, p. 394). This turn is in echo as it turns to the echo of the first beginning with the early Greeks.

An echo is a reverberation. It is a repetition, in which the style or play of the original question resounds – without the emergence of the original question as originally asked. Within that resounding – from there to here – and within our thinking’s response lies the provocation and evocative possibility. In the re-turn, in echo-thinking, to the saying/showing of the first beginning is the possibility (the only one? the most fruitful one?) of entering that place of opening described in the first imaging.

It is in this sense of the place of opening that I read a sentence from ‘The end of philosophy and the task of thinking’:

Accordingly, the day may come when thinking will not shun (will be able to hear) the question of whether . . . the free open [the opening as such, the place of opening as the place of being] may not be that alone within which . . . everything emerging into presence and falling away from presence in them truly occupies the place which gathers and shelters everything.¹⁰

In *Beiträge zur Philosophie* (Paragraphs 81 and 82) Heidegger addresses this return and echo in terms of a *Zuspiel*, literally ‘a pass to (us)’. In its root sense *Spiel* is ‘moving freely’ (as in *Spielraum*: a place/

space in which to move freely). Thus *Zuspiel*: freely moving to, from there to here. This free moving of the first beginning with the early Greeks 'is not a historical contribution or the start of a "new system", but is in itself the root preparation for the other beginning – the preparation that initiates transformation'.¹¹

The earliest name for being is τὸ χρεών in Anaximander, followed by εἶν in Parmenides. In reading these texts from early Greek thinking, Heidegger's own work has been to open up the domain of being as such, to think being for what it is: not defined in terms of beings, but rather told in its own right. Thinking this domain was an ongoing work for Heidegger, enjoining many years and spanning the history of metaphysics, from its start to its extreme possibility in the root-character of technology. Underlying this whole history is the decisive move in thinking whereby beings and being were no longer distinguished, whereby *what* emerges into presence and the emergence as such were no longer thought as different. What was not thought was being or the emerging as such.

In 'Der Spruch des Anaximander' Heidegger writes: 'The real core of emerging, and with that the difference between emerging and *what* emerges, got forgotten' (GA 5, p. 364). A marginal note here says: 'The difference [*Unter-schied*] meant here is infinitely other than all being that remains being *of* beings. Thus it is no longer appropriate (no longer in accordance) to name the difference with the word *being/Sein*' (GA 5, p. 364). And in *Grundbegriffe*, *Unterscheidung* is read as an expanding and an opening.

If we read this in accordance with the unresolvability of the question as presented earlier, then (1) *Unter-schied* is always already dynamic, a being at work (*energeia*), even self-oscillating – thus saying 'opening' rather than 'difference' – and (2) once Heidegger's thinking has delved this deeply into the question that guides all his thinking – into the same to which every thinker is bound so tightly – the word *being/Sein* is no longer fitting or appropriate. This calls for a re-naming of being, a re-naming of the *Sache* at the heart of the work of thinking that we call 'Heidegger'.

Heidegger does this re-thinking and re-naming in the three texts that provide the context or encircling for my presentation. He does this by re-thinking τὸ χρεών in Anaximander and εἶν in Parmenides. (Heidegger's texts in which he reads Heraclitus do the same re-thinking, each in its own way.)

The way into these early Greek sayings initially takes us aback; we are surprised, startled and confused. Everything is strange. Rather than trying to make these sayings accessible to us in our terms, we need to go all the way into (*erfahren*) *our* being excluded – seeing ourselves as distanced from them.

This distance is not a non-relation. On the contrary this distance,

when properly entered into, brings us nearer. Today's priority given to knowledge or information reduces and contracts the questions of these sayings of the first beginning into answers of metaphysics. Dialectic diminishes (reduces) over against the hidden fruitfulness (possibility) of the shapings of this originary opening. Thus these sayings of Anaximander and Parmenides demand of us to get some distance from the usual interpretations (or 'readings'). We are called to something quite different: 'Simply listening to that from out of which the saying there comes' (GA 51, p. 100).

Let me here – all too briefly – let Heidegger's reading of τὸ χρεών and εἶν emerge for the reading that it is: one that re-opens [the matter/*Sache*] named in the German word *Sein* and the English word *being* and, in that re-opening, re-names the *Sache*. To ask the question: what is the name of the *Sache*? is to point to something most essential in the *Sache*. For the name of anything says the deepest root character of that thing. The name is not merely an arbitrary label, but is essentially an imaging of the thing itself. *Therefore, to re-name [the matter/Sache] of being is to say that deep root character in a deeper, more originary way.*

The Anaximander Fragment reads:

ἐξ ὧν ἡ γένεσις ἐστι τοῖς οὖσι, καὶ τὴν φθορὰν εἰς ταῦτα γίνεσθαι κατὰ τὸ χρεών· διδόναι γὰρ αὐτὰ δίκην καὶ τίσιν ἀλλήλοις τῆς ἀδικίας κατὰ τὴν τοῦ χρόνου τάξιν.¹²

Heidegger's rendering into German reads:

Von woheraus aber der Hervorgang ist dem jeweilig Anwesenden auch die Entgāngnis in dieses (als in das Selbe) geht hervor entlang dem Brauch; gehören nämlich lassen sie Fug somit auch Ruch eines dem anderen (im Verwinden) des Unfugs entsprechend der Zuweisung des Zeitigen durch die Zeit.¹³

My rendering of the German into English reads:

The place from out of which emergence comes is, for everything that emerges, also the place of disappearance into this (as into the same) – in accordance with exigence (brook); for they let enjoining and thereby also reck belong to each other (in the getting over) of disjoining, responding to the directive of time's coming into its own.

The first step into this saying is taken with the words γένεσις and φθορά: emerging and disappearing, coming forth into presence and withdrawing. Traditionally these words were taken to be about things, beings: the coming forth of beings and their going away. To think in a Greek

way, we must think the 'forth' and the 'away'. When we do that, however, we see that emerging and disappearing do not refer primarily to beings, but to the movement itself, i.e., the words are to be taken *in themselves* as describing *being* and therefore they say the emerging as such, rather than emerging/disappearing things/beings.

This takes place κατὰ τὸ χρεών: in accordance with τὸ χρεών. The usual translation is 'necessity': what compels and what must inescapably be. But if thinking expands into this word in its Greek-ness, the word suggests χράω, χράομαι – and then ἡ χεὶρ: the hand. Χράω: I reach for, extend my hand – and then I hand over, let something belong.

Thus τὸ χρεών is the handing over of emergence; this handing over hands out (furnishes) emergence *to* what emerges and thus holds (in its 'hand') and preserves what emerges as precisely what it is, holds it in its hand, i.e. in emergence itself.

(GA 5, p. 366; E, p. 52)

The German word for emergence is *das Anwesen*. The more usual English translation of *Anwesen* is 'presencing' or 'presence'. I deliberately use the word *emergence*, to avoid the danger of implying a 'presence' in 'presencing' – thus letting thinking think in terms of presence rather than 'presencing'. The *Sache* in Heidegger is clearly *not* presence, but *Anwesen* in its work of emergence, i.e., in its work as *being*: The published English translation fell and slipped on this very danger. It reads: "Τὸ χρεών is thus the handing over of presence [*Anwesen*], which presencing delivers to what is present."¹⁴ This translation suggests that there are two realms named here: the realm of what comes to presence (beings) and the realm of presence, with *Anwesen* (presencing) as the movement *between* these two realms. Much of Heidegger-scholarship has stumbled on this rock, by not staying long enough or working closely enough with this realm of *Anwesen* itself, thus getting lost by taking the *Sache* of *Anwesen* to be one of *presence*. Frankly, *presence as such* – separated out from emerging ('presencing' if you will) is only an issue for metaphysics (named by Heidegger as *Anwesenheit*) and is never the *Sache* of being.

Τὸ χρεών as handing over or furnishing Heidegger ventures to call in German: *der Brauch*, use/usage, making use of, service, serving oneself with something, the reach over; *brauchen*: to reach over, require; *sich gebrauchen*: lend oneself to. *Brauchen* is *bruchen*, Latin: *frui*; to enjoy by having at hand. "“*Brauchen*” thus says: to let something that emerges emerge as emergent . . . to hand out (furnish) something unto its own essence and to hold it as thus emerged in its preserving hand' (GA 5, p. 367; E, p. 53).

Given that γένεσις and φθορά name the work of being as such – and not of beings – so too does τὸ χρεών, that in accordance with which

γένεσις and φθορά are what they are, namely the opening of being. Enjoying by having at hand, furnishing, handing over (*der Brauch*) is not said of human comportment, but rather names the way in which being itself unfolds in its connection with what emerges, a connection that has to do and deals with what emerges as it is: τὸ χρεών (cf. GA 5, p. 368; E, p. 54).

This word, τὸ χρεών/*der Brauch* is not easy to render into English. The more obvious words *need* or *use/usage* hardly convey any of this rich nuance of furnishing, handing over, allowing to emerge. English has two, not readily accessible words: *exigence* (from *exigo*, *ex-ago*: I drive forth/out, carry forth/out, dispatch, turn out) and *brook* (from Middle English *broc*: breaking/bursting forth, yielding, bearing forth). I offer both of these words, each somewhat awkward, as a way to say what Heidegger says here, in the German word *der Brauch*.

In the Anaximander fragment τὰ πολλά and τὰ πάντα are the names for τὰ ὄντα (beings) in general. However, ὄν and ὄντα were originally ἑόν and ἑόντα. With that their rootedness in the word εἶναι was secured. Indeed Parmenides and Heraclitus always use ἑόν and ἑόντα. The move from ὄν to ἑόν is the decisive move into the region of being. And this move in our thinking is an echoing re-turn to the place of opening within the first beginning in the thinking of Parmenides and Anaximander.

‘But ἑόν (“being”) is not simply the singular of the participle ἑόντα (“beings”)’ (GA 5, p. 345; E, p. 33). Rather ἑόν names the region of being as such, the one, the same, that binds all thinking. Everything depends on a proper reading of ἑόν.

Without exaggeration . . . we could say that the [whole] unfolding of the West depends on how the word ἑόν gets translated, provided that the translation rests on the translation to the truth of what comes to language (gets said) in ἑόν.

(GA 5, p. 345; E, p. 33)

Τὰ ἑόντα, the word that really names what comes to language in Anaximander, ‘names that which, unspoken in thinking, speaks in all thinking, even as it itself remains unspoken. The word names that which from then on lays claim to all of Western thinking, whether expressed or not’ (GA 5, p. 351; E, p. 38).

A few decades after Anaximander, in Parmenides, the word ἑόν (and εἶναι) is named explicitly as the fundamental, root word for Western thinking.

In ‘Der Spruch des Anaximander’ Heidegger says that Parmenides thinks ἑόν – as the emerging of what emerges – in terms of the ‘hidden and unresolved fullness of the disclosure of beings’ – unresolved as it is thought from out of ἀλήθεια, ‘the disclosing sheltering’ (GA 5, p. 352;

E, p. 39). Here *έόν* is thought from out of the disclosure of *έόντα* (beings) and is thought in terms of *Unverborgenheit* as disclosing/revealing/concealing. Disclosure is named 'the open region'. The focus here is on the expanding/staying of the opening (*Unter-scheidung*) that comes to language in the word *έόν* (cf. *GA* 5, p. 363; E, p. 48).

Unspoken in Anaximander, spoken in Parmenides, the word *έόν/είναι* says: 'Emergence into disclosure [*Anwesen in die Unverborgenheit*]. Hidden in that statement is [the imaging that] *Anwesen* itself brings disclosure with it. Disclosure itself is emergence. Both are the same, but not identical' (*GA* 5, p. 370; E, p. 55).

Thus the first stage in Heidegger's thinking *έόν* in Parmenides is in terms of *Unverborgenheit*/disclosure: *ἀλήθεια/entbergendes Bergen* (as the fullness of *Unverborgenheit*)/emerging sheltering (as the fullness of disclosure). The second stage in Heidegger's thinking *έόν* in Parmenides is in terms of *Anwesen*/emergence. It is to *έόν* as *Anwesen*/emergence that the small piece read at the Seminar in Zähringen turns to. This piece of writing (*GA* 15, pp. 401–7) – one of Heidegger's last pieces of writing – along with the transcript of the discussion that followed Heidegger's reading of the text during the Seminar, opens up a new dimension or turn in the work of thinking that we call 'Heidegger'. There his thinking works explicitly tautologically, saying the same as indeed it itself. That same is *έόν*.

The context in which Heidegger read this brief text on Parmenides was the question of entering into being. It is the same theme as the one named with *Da-sein*; for both have to do with clearing/*Lichtung* – with opening.

Parmenides names this theme or realm for thinking: *τò έόν* – which, Heidegger says, names neither *beings/das Seiende* nor *being/das Sein*, but rather *τò έόν: Anwesend: Anwesen selbst*: emergent (coming forth, unfolding): emerging (coming forth, unfolding) itself.

He begins with Fragment VI, 1:

έστι γὰρ εἶναι

Is: that is to say, being.

The saying refers to being, not to beings. Being is. Heidegger hesitates on this, because one can say 'it is' only of beings. Being precisely is not. But Parmenides says here: *being/das Sein* is. Heidegger asks: are we capable of hearing this Greek word, that speaks of *έστι* and *είναι*, with a Greek ear? (*GA* 15, p. 397). Or: do we think the Greek saying of the words *έστι* and *είναι* in a Greek way? Finally: in using the words 'is' and 'being', do we think precisely enough at all? (*GA* 15, p. 405).

Thought in its Greek way, the word *είναι* says: *anwesen/to emerge*. This verb speaks more precisely. It brings us, in a greater revealing,

closer to the *Sache* to be thought. In accordance with this we must render ἔστι γὰρ εἶναι as: *anwest nämlich anwesen*: emerges, that is to say emerging.

(GA 15, p. 405)

What is being thought here is not being in its difference from beings, but rather only emerging: being as emerging, or simply: emerging itself.

The word of Parmenides that names this *Sache* is τὸ εἶν. Heidegger says τὸ εἶν as *anwesend*: *anwesen selbst* or *anwest nämlich anwesen*: emerging: the emerging itself; unfolding: the unfolding itself; emerges, that is to say emerging; unfolds, that is to say unfolding – emerges emerging.

Where and how does emerging¹⁵ emerge? ‘into disclosure’. But then εἶν is the ‘heart’ of disclosure/ἀλήθεια. Τὸ εἶν, ‘itself residing in itself, is decisive for and disposes disclosure through and through’ (Parmenides, Fragment VIII, 4, as Heidegger reads it in GA 15, p. 405).

What does this say with regards to ἀλήθεια? Heidegger says: we must think ἀλήθεια as τὸ εἶν: emerging, emerging itself.

Heidegger finishes his short text on Parmenides with this remark:

The remark in the poem of Parmenides lets us see:

‘The emergent emerging itself disposes
the revealing unfolding disclosure that encircles.’

‘*Das anwesend: anwesen selbst durchstimmt
die schicklich entbergend es umkreisende Unverborgenheit.*’

(GA 15, p. 407)

This says, not so much that εἶν/emerging lies at the core of ἀλήθεια/disclosure – it does say that – but more that to think ἀλήθεια is to think it as emergent emerging. Thus on the one hand it is helpful to think ἀλήθεια in its two components, λήθη and the ἀ-. Thus: hiddenness/closure and revealing/disclosure. The danger in that way of thinking is that the *Sache* remains a twofold, a dichotomy, with two positions. Heidegger explicitly tells us that he himself fell prey to this danger in ‘The end of philosophy and the task of thinking’, when he suggested that λήθη is the heart of (lies at the root of) ἀλήθεια. In the discussion that followed his reading of the Parmenides text (in Zähringen), Heidegger says that what he suggested in that earlier essay – that λήθη lies at the heart or root of ἀλήθεια – is simply not true: Parmenides did not say anything like that (cf. GA 15, p. 395). Rather to think the whole of ἀλήθεια is to think εἶν: emergent emerging.

Τὸ εἶν allows thinking to think the one, the same, in its ongoing work of emerging. Thus it never rests anywhere, neither thinking nor the *Sache*; it never allows one or the other dimension to settle out and be

'at the bottom' or 'at the top'. Tautological thinking is needed to do this kind of thinking work. The word *emerging/Anwesen/τὸ ἔόν* names tautologically in that there is within it no dichotomy, even as it carries within it the highest tension and movement.

The way of thinking that Parmenides calls for here is *πυθέσθαι: erfahren*: going all the way into. Parmenides names this more precisely (goes further into it) in Fragment VI, 1:

χρὴ τὸ λέγειν τε νοεῖν τε . . .

Incumbent is

saying (letting the self-showing) and

(thereby ensuing) facing up to

and taking it in.

(GA 15, p. 406)

Heidegger names this kind of thinking a *reines Erblicken*: pure beholding, simply taking it in, being awake to.

In thinking (as pure beholding) *τὸ ἔόν* (as emergent emerging), the question of being (the place of its opening) is expanded beyond being (as being, *Sein*, *ὄν*, *ens*) and beyond being (as in *Sinn des Seins*) to *ἔόν*: emergent emerging. In fact the word *being* no longer names the *Sache*.

With this kind of thinking there is no proving, no logical argument, no dialectical thinking, no foundational explaining. Rather what holds this thinking is what comes over against it; what turns its gaze to it. Simply put, this kind of thinking *is* phenomenological.

Fifth imaging: hinting's many hues

Being as a *question* opens up within that point where being as other than beings is unresolvable; dialectical thinking opens out into tautological thinking; and being is renamed as *ἔόν/Anwesen/emerging*. Saying these several imagings cannot happen within the confines of logic or calculative thinking. Rather saying shows itself as suggesting, intimating, surmising – in short: saying is hinting.

The most revealing word from early Greek thinking, for showing this imaging of hinting, is Heraclitus, Fragment B93: *ὁ ἀναξ, οὗ τὸ μαντεῖόν ἐστι τὸ ἐν Δελφοῖς, οὔτε λέγει οὔτε κρύπτει ἀλλὰ σημαίνει*. The work of thinking that we call 'Heidegger' comes back to this fragment again and again. An English rendition that pulls together several of Heidegger's German renderings of this fragment might go something like this: 'The sublime one whose place for intimating saying is at Delphi neither discloses (only) nor conceals (only), but rather hints, gives signs, points to, intimates.'¹⁶

Heidegger renders the crucial word, *σημαίνει*, into German as *winken*

(be-deuten) and as *Zeichen geben*. In 'Erinnerung an Hans Jantzen' Heidegger says, simply: 'Hinting [*Der Wink*] is the revealing and simultaneously concealing showing.'¹⁷

In 'Hölderlins Hymnen "Germanien" und "Der Rhein"' Heidegger says:

Originary saying does not only immediately reveal, nor does it only simply and plainly conceal; rather this saying is both at once. And in this way it is a hinting [*ein Winken*] in which what is said intimates what is unsaid and what is unsaid intimates what is said and *to be said*. It is a hinting in which what is in tension intimates the accord [*Einklang*] that it is and the accord intimates the tension within which alone it oscillates (flourishes).¹⁸

In *Heraklit* Heidegger says:

A marking [*Zeichen*] is something that is shown or revealed . . . [which] unfolds essentially in a not-showing. . . . The showing of markings is the originary way in which what later gets differentiated – disclosing for itself and concealing for itself – *still holds sway unseparated* . . . thought in a Greek way, 'markings' are the *self-showing of emerging itself*, to which this self-showing belongs.¹⁹

Emerging itself emerges as the ταῦτόν τ' ἐν ταὐτῷ τε μένον καθ' ἑαυτό τε κεῖται: the self-same, together with itself, just as it is in this very place, within the core movement/tension of itself. Its proper way of showing itself is as a hinting/intimating.

At the end of a series of poems entitled *Winke* (*Hintings*, privately printed in 1944, now in *GA 13: Aus der Erfahrung des Denkens*), Heidegger writes: '“Hintings” are words of a thinking that (a) in part needs this expression but (b) is not fulfilled in the expression.'²⁰ Why? Because such a thinking thinks being – now ἐόν/*Anwesen/emerging*.

It belongs essentially within the αὐτό of the free open/opening – that opening named in ἐόν/*Anwesen/emerging* – that it can only be said tautologically. Tautological thinking is a hinting thinking.

In *Grundbegriffe* Heidegger uses the word *ahnen* for this hinting. Hinting as intimating or surmising. What is intimated has no position and is not conclusive. To intimate is to have a feel for what comes over or befalls one. This is only intimated, but is more essential than any certainty in calculating what is not-essential. What is called for is to surmise (let befall one) that from out of which beings emerge (emerging itself) and to say with what is so surmised/intimated. 'Thinking in and for intimating/surmising is essentially stronger and lays greater claim

than any formally conceptual discrimination in whatever realm of the calculable' (GA 51, p. 12).

This kind of thinking can only be practised; it cannot be talked about or 'ascertained'. In the lecture course text of 1923 entitled *Ontologie* (GA 63) Heidegger says simply: 'Phenomenology can be appropriated only phenomenologically.'²¹

Sixth imaging: what belongs to reading as its ownmost

The look of that which has claimed us – the look of being, now named emergent emerging, *έόν* – is the deepest possible confirmation of the thereness of being as emergent emerging. And the look of being continually proffers and confirms our relation to that thereness – manifesting and nourishing it in its disclosure, in its 'truthing'.

Proper reading – reading in its ownmost – has its appropriate concern in this look. As Heidegger says in 'Was heißt Lesen?': 'Without proper reading we cannot see what turns its gaze to us.'²² We cannot gaze on what emerges.

Do we know at all anymore what reading is? Where do we read unto – and where from? Why do we read at all? How is proper reading? What is called forth and evoked in proper reading? These are the unspoken questions with which the work of thinking presented here began, some months ago.

There are two areas of concern in opening up proper reading. First, normally and traditionally we in our thinking are held back from proper reading by *our* own comportment. Our comportment does not heed what turns its gaze to us. Rather we assume a certain definition and normally have always already comprehended (conceptualized) the *what* of the words read. In this sense proper reading is a matter of a renewed attentiveness.

Reading is not based on 'our' ability to decipher and interpret. It goes deeper than that. It calls for a detachment from 'personal' inclinations and in that detachment opens out to that which claims reading/thinking in its look/gaze. The look of things always already shows the look of *έόν*, of the emergent emerging. In reading we are called (evoked) to foster a fertilizing contact with the pregnancy of *έόν*, to be open to what we read in our reading in *its* turning its gaze to us. Reading in this way, we 'fall into round' – to use a potter's expression – and thinking reading takes its shape *from* that which gazes upon it. This is the *έόν*/emergence in the first beginning with the Greeks. Indeed, the hinting character of that first beginning stems from attentiveness to precisely this domain, which calls for a thinking that reads properly, rather than a thinking that

runs roughshod over the written text, always already knowing what is to be found there.

Think of this mode of thinking/reading as a hand-craft. It works by handling the words, the reading. This is the place of *έόν* as such – *έόν* in its suchness, the suchness of *έόν*. *Έόν* is what turns its gaze and touches us; it is the name for the opening cast to us in the unresolvability of being-beings; it is thinkable tautologically, and not dialectically; and it calls for a hinting/intimating thinking, rather than the direct hit of a calculating, resolving thinking.

The second area of concern in opening up what proper reading is is that traditionally we are held and entangled within the web of ordinary grammar. We usually allow 'grammar' to give us the definitive word on language and how it speaks. What we have been trying to do here has actually been held back by grammar.

Sentences in their sentence-structure cannot reach far enough into that which turns its gaze to us. Though having grammatical shapes, words and sentences always carry an imaging that is not bound to that grammar. Words then become guide-words for imaging beyond grammar; this imaging is evoked by what turns its gaze to reading.

Thus we are called to be more attentive, more gathered, for what lies deeper in the words, though not deeper *than* the words (cf. *GA* 51, p. 68).

If we hear language within the deeper saying of the word, only then is it on the mark – and the affordance of the origin hidden in the first beginning (i.e., the neighbourings of the first and the other beginnings, as original beginnings, both) hints and haunts it.

Proper reading is attentive to the evocative character in what turns its gaze to us. Thus pure beholding evokes the deeper root saying.

Words take on the shape of the clearing/opening. Words do not grasp (conceive) objects, but rather evoke. Words render seeable and hearable and touchable.

The reader is thus led into the region or regioning of opening that imaging words image.

For this to take place, words move away from their grammatical expression into evocative saying. In evocative saying words do not show a ready-made content, but rather carry an appeal – by indirection and hinting. This appeal carries the reader over to evocation – and thus to a transformation in thinking.

In hinting saying, that which casts its gaze on the reader, there is no defined or definitive content. Rather there is the free receiving and discerning of the opening/clearing.

This is the opening/clearing that lets beings be, that lets echoing words resonate with silence/stillness. This resonance of echoing words and of stillness names the one, the same, self-oscillating *έόν*: emerging.

Seventh imaging: drawing to a close

This presentation has carried the intention, not to resolve the question, but to be attentive to its re-shaping, to come closer or nearer to the question in its own *energeia*.

In thinking as well as in hinting and in proper reading there is a responding, not only to the known, but also to the unknown. Thinking and the hidden are inseparable – and require the ongoing work of our response. Thus thinking always takes place in and is a response to a showing extending and expanding beyond the shown. This is the torso-dimension of all root thinking: it always points beyond. In reading, the writing that one reads always points beyond – this excess is not something beyond the text. Rather it is carried in the text as the process or *energeia* of emerging itself.

Recognizing the ambiguity in this expanding beyond the shown – and letting that ambiguity be what it appears to be – opens up a deeper way of showing, of self-showing.

In a sense what we do here is a construction – even of ambiguity – but more fundamentally than that it heeds/respects/even honours a trace ‘naturally’ left within.

I am reminded of a poem by Rilke, in which he sings of a torso of Apollo. The torso glows like a candelabra in which the look/gaze of the torso is held and sparkles and shines. If the torso did not so glisten, did not so carry within itself the life of the eye or the chuckle of the heart, then it ‘would not break out of all its borders, like a star: for there is therein no point that does not see you’.²³ It is this *energeia* of expanding beyond that is carried in language that says/shows; and it is in proper reading that this expanding emerging turns its gaze upon the reader.

Within the context of such an opening, the question of being cannot at all any longer be taken or read as a metaphysical question. Given this bond to the expanding of opening, all forms of Heidegger’s question open out beyond the metaphysical – be it the move from *Sinn des Seins* to *Wahrheit des Seins* to *Wahrnis des Seins* to *Unverborgenheit* to *έόν/Anwesen selbst*, be it the move from subject to *Dasein* and *Erschlossenheit* to *Geschick des Seins* to *Ereignis*.

In every case the work of thinking is held to this opening. In order to see this, we must take very seriously Heidegger’s own ‘corrections’ of his work. Examples of Heidegger’s ‘corrections’ come up in the several texts that we have worked with here:

(1) As already mentioned, in the Seminar in Zähringen in 1973 Heidegger says that his statement (in ‘The end of philosophy and the task of thinking’) that *λήθη* is the heart of *ἀλήθεια* simply does not work. That is not how Parmenides says/thinks/intimates the *Sache*.

(2) There is clearly a re-thinking of the Anaximander fragment from the time of the lecture course *Grundbegriffe* (1941) to the writing of 'Der Spruch des Anaximander' (1946). This is seeable (a) in that in the later text Heidegger no longer considers the whole of the Anaximander fragment as handed down to be authentically by Anaximander himself and (b) much more importantly, in that the central word for naming the *Sache*, τὸ χρεών, is thought in its root unfolding as *Brauch* only in the later text.

(3) In *Grundbegriffe* Heidegger tries to uncover a deeper sense to the words *be-greifen* and *Begriff*, whereby they might be able properly to name the *Sache*. In the Seminar in Zähringen he no longer holds out this possibility for the word *Begriff*. 'The Greeks do not have *Begriffe*. *Begreifen* is a way of comportment that takes possession of. The Greeks do not grasp [*be-greifen*]' (GA 15, p. 399).

(4) In 1973 Heidegger explicitly states that the phrase *Sinn des Seins* from *Being and Time* does not say the *Sache* that is to be thought (GA 15, pp. 345 and 373).

How shall we read these changes? The question is not: is Heidegger metaphysical here? Or just where and how is Heidegger a metaphysician? Rather the question is how to read underneath and deeper than the *grammar*, to what is evoked in the saying? Evocative thinking is always directed toward the *Sache* and emerges from out of the *Sache*. To home in on a word or concept – or even a phrasing – as metaphysical is to miss the point. Heidegger above all grants the indeterminate dimension, the perhaps in the look of εἶναι. Thus the way is involved in the undeterminable and non-conceptualizable – therefore always hinting. The way is always open to revision (a re-seeing) and thus to a new opening to the same.

Again we hear the Zuspil from *Beiträge zur Philosophie*: 'Coming to grips with the necessity of the *other* beginning from out of the originary bearing of the first beginning.'²⁴ This thinking is always ongoing, playing one beginning out for the other – always attentive to the *Sache* of being, now named εἶναι/*anwesen*/emerging. The issue is not how Heidegger 'has changed his mind', but rather how the work of thinking that we call 'Heidegger' comes to grips with the *Sache* by staying always more decisively and more rigorously with the same.

Finally, reading, thinking and hinting call for forgetting Heidegger for Heidegger's sake and becoming involved in the onefold of the always oscillating expanding into the clearing of being, the opening that is named in εἶναι: emergent emerging. To think in the 'Heideggerian mode', then, is to expand into the one question and to respond thoughtfully to it.

Hinting reading thinks along with the text. Hinting thinking reads the text for what it evokes. Thinking reading hints in such a way that what

turns its gaze evokes. Thus, in proper reading is *der Einsprung in die Wesung des Seins* – or *Einsprung in die Anwesung des Anwesens*.

Notes

1 The three works referred to here are, in chronological order: *Grundbegriffe*, vol. 51 of the *Gesamtausgabe*, Freiburger Vorlesung Sommersemester 1941, ed. Petra Jaeger (Frankfurt am Main: Vittorio Klostermann Verlag, 1981); 'Der Spruch des Anaximander' (1946) in *Holzwege*, vol. 5 of the *Gesamtausgabe*, ed. Friedrich-Wilhelm von Herrmann (Frankfurt am Main: Vittorio Klostermann Verlag, 1977); and 'Seminar in Zähringen' (1973) in *Seminare*, vol. 15 of the *Gesamtausgabe*, ed. Curd Ochswald (Frankfurt am Main: Vittorio Klostermann Verlag, 1986). Hereafter these three works will be referred to in the text as GA 51, GA 5 and GA 15. References to GA 5 will be followed by an E (e.g. GA 5, p. 345; E, p. 33); the E refers to the published English translation of 'Der Spruch des Anaximander', entitled 'The Anaximander fragment' and appearing in Martin Heidegger, *Early Greek Thinking*, tr. D. F. Krell and F. A. Capuzzi (New York: Harper & Row, 1975).

2 *Einführung in die Metaphysik* (GA 40), ed. Petra Jaeger (Frankfurt am Main: Vittorio Klostermann Verlag, 1983), p. 83; *Einzelausgabe* (Tübingen: Max Niemeyer Verlag, 1953), p. 59.

3 *Aus der Erfahrung des Denkens* (GA 13), ed. Hermann Heidegger (Frankfurt am Main: Vittorio Klostermann Verlag, 1983), p. 13.

4 'Grundsätze des Denkens', in *Jahrbuch für Psychologie und Psychotherapie*, iv (1958), 34.

5 *ibid.*, p. 37.

6 Hegel, *Wissenschaft der Logik*, Buch, II, Lass, ii, S. 31.

7 Hegel, Vorrede to *Phänomenologie des Geistes*, ed. Johannes Hoffmeister (Hamburg: Felix Meiner Verlag, 1952), pp. 29–30.

8 The preceding several paragraphs appeared earlier, in a slightly different form, in my essay 'Parmenides: circle of disclosure, circle of possibility', *Heidegger Studies*, i (1985), 13.

9 'Nur noch ein Gott kann uns retten', *Spiegel* interview with Martin Heidegger, 23 September 1966, in *Der Spiegel*, no. 23, 1976, p. 212.

10 'Das Ende der Philosophie und die Aufgabe des Denkens', in *Zur Sache des Denkens* (Tübingen: Max Niemeyer Verlag, 1969), pp. 72f.

11 *Beiträge zur Philosophie (Vom Ereignis)* (GA 65), ed. F. -W. von Herrmann (Frankfurt am Main: Vittorio Klostermann Verlag, 1989), p. 170.

12 In GA 51 Heidegger takes this whole fragment to be authentic and by Anaximander himself; in the *Holzwege* essay he says that he is inclined to consider only . . . κατὰ τὸ χρεῶν διδόναι γὰρ αὐτὰ δίκην καὶ τίσιν ἀλλήλοις τῆς ἀδικίας as from Anaximander himself. However, he adds that the first part of the saying, though probably not from the hand of Anaximander, should not be simply excluded, but rather kept as an indirect witness to Anaximander's thought by virtue of the strength and saying-power of his thought (GA 5, p. 341). For my purposes here the philological question – significant as it might be – has no bearing, in that the earlier part remains 'Anaximandrian' if not by Anaximander himself.

13 The first and the last part of this German rendition by Heidegger comes

from GA 51, p. 101; the middle part (that part *alone* that Heidegger considers to be by Anaximander himself) comes from GA 5, p. 372.

14 Cf. *Early Greek Thinking*, p. 52.

15 Heidegger's own text here – the one that he read to the group assembled for the seminar – reads: *Anwesen* (emerging) (GA 15, p. 405). The *transcript* of the text reads: *Anwesenheit* (presence) (GA 15, p. 398). I find this discrepancy to reveal a significant difference in meaning. The word *Anwesenheit* covers up the poignant and sharply focused dimension of Heidegger's thinking in this short text.

16 For a complete listing of Heidegger's many readings of this fragment, see Kenneth Maly and Parvis Emad (eds), *Heidegger on Heraclitus: A New Reading* (Lewiston: Edwin Mellen Press, 1985), pp. 54f.

Beyond being: Heidegger's Plato

Robert J. Dostal

For Martin Heidegger metaphysics is Platonism.¹ Heidegger's attack on metaphysics is equivalently an attack on Platonism. Brief comments about Plato are not uncommon in Heidegger's published works, but there is only one published essay devoted exclusively to a text of Plato – 'Plato's doctrine of truth'.² This essay's principal thesis is that Plato transformed the notion of truth from unconcealment (*Unverborgenheit*) to correctness. Though this was written at a time (1930/1) when Heidegger's thought was making the famed and controverted turn (*Kehre*), the critique of Plato remains essentially the same throughout Heidegger's work. There is, of course, the late concession in 'The end of philosophy and the task of thinking' that 'the assertion about the essential transformation of truth [in Plato] . . . from unconcealment to correctness is . . . untenable'.³ But, as we will see below, this does not alter Heidegger's unrelenting critique of Plato.

Unlike other aspects of Heidegger's work, his Plato critique has not elicited widespread discussion, presumably because he himself wrote so little on Plato. The best responses to Heidegger's essay on Plato have come from those close to and sympathetic with Heidegger's work yet unsympathetic with his Plato interpretation. It was perhaps the sharp criticism of Paul Friedländer more than any other that motivated Heidegger's late concession.⁴ Friedländer had been a colleague of Heidegger at Marburg and a member of the *Graecum* in which Heidegger participated at a time when Heidegger's Plato critique was taking shape.⁵ Another notable critic was Gerhard Krüger, a student of Heidegger at Marburg.⁶ He criticized Heidegger, just as Friedländer had done before and as Stanley Rosen (a student of Leo Strauss, another student of Heidegger at Marburg) has done more recently, for Heidegger's neglect of the ontological on behalf of the epistemological in Plato.⁷

The most compelling response to Heidegger's reading of Plato,

however, has been that of Hans-Georg Gadamer – another Marburg student of Heidegger. Though Gadamer almost entirely foregoes taking direct issue with Heidegger, his own life-long work on Plato constitutes a challenge to Heidegger's view of Plato. Gadamer attests to this when he writes of his own Plato interpretation: 'Behind it all, however, stood the constant provocation which Heidegger's own pathway of thought means for me – in particular his interpretation of Plato as the decisive step in the direction of the forgetfulness of Being of "metaphysical thinking"'.⁸ A large thesis of Gadamer's Plato interpretation is the proximity of Plato and Aristotle. Gadamer would defuse much of Aristotle's critique by showing not only its inappropriateness but also the sources of Aristotle's own doctrine in Plato. This is relevant to the matter at hand since Gadamer thereby counters both Heidegger's acceptance of Aristotle's critique of Plato and Paul Natorp's defense of Plato and sharp critique of Aristotle. Heidegger's own view, I suggest, can in part be understood as a response to Natorp and the 'Neo-Kantian' Plato.

With the major thesis of this almost consensual critique of Heidegger's Plato interpretation I am largely in agreement.⁹ What I mean to do here is to expand the context within which Heidegger's Plato interpretation should be considered. First of all, the then prevailing Neo-Kantian interpretation of Plato, especially that of Natorp, will be seen to establish in part the framework within which the early Heidegger came to Plato. Secondly, Heidegger's Plato essay should be considered within the context of the development of Heidegger's own thought. The recently published lectures from Heidegger's Marburg period provide us with a view of the early development of his understanding of Plato. They exhibit a fundamental continuity with the later Plato essay. They also provide, at least at first glance, a kind of puzzle: what Heidegger so provocatively ignores in the Plato essay is the focus of his attention in the Marburg lectures, viz., the controversial statement in the *Republic* that the Good is 'beyond being' (*epekeina tes ousias*) (509B). As those lectures would have it, what Heidegger seeks for the completion of his project is an adequate treatment of the *epekeina*. And further, the term *epekeina* names the completion of his ontological project in the title 'metontology'. The Plato essay was written some two or three years later at a time (1930/1) when Heidegger was writing *On the Essence of Truth* (*Vom Wesen der Wahrheit*), whose basic theme is the same as the essay on Plato – truth. Though the 'turn' in Heidegger's thought is impossible to fix with respect to a single text, I suggest, contrary to Hannah Arendt, that these essays are contemporaneous with at least the beginning of the turn and the abandonment of the ontological project of the Marburg period, the project of *Being and Time*.¹⁰ Accordingly, the problem of truth as Heidegger grappled with it at this time is extremely relevant to any understanding of the Plato essay. Here too the Marburg lectures

allow us to see more clearly the difficulties Heidegger faced in the completion of his project. One of the primary shoals upon which it founders is the attempt to establish an ontological notion of truth in opposition to the prevailing epistemological view. The consideration of this attempt brings us to another puzzle – Heidegger's lack of recognition of the proximity of his own position to that of Plato. Plato, I suggest, was neither a realist nor an idealist as Heidegger construes these positions. I am suggesting further, that Plato's notion of the ideas – whatever the stage of development – is not adequately captured by either a transcendent 'other world' view or a Neo-Kantian transcendental view. Like Heidegger, Plato was concerned less with the epistemological criteria for truth than with the ontological conditions for truth. Our recognition of this proximity helps explain why a teacher with such a short-sighted interpretation of Plato should have students who are such perceptive readers of Plato.

1

The immediate context for the approach of Heidegger to the age-old conflict of Aristotelianism and Platonism is the controversy over this conflict in Weimar Germany. This was the time when Heidegger taught at Marburg (1922–8) and counted among his students Gadamer, Krüger, and Strauss together with Jacob Klein, Karl Löwith, and Arendt among others. His colleagues included Friedländer and Natorp, the eminent Neo-Kantian.¹¹ This was the time when the reign of Neo-Kantianism faltered in academic philosophy in Germany. This dethronement was due in large part to the phenomenological movement led primarily by Edmund Husserl but also by Max Scheler and, not least, by Heidegger (which is not to say that the turn to Hegel and Marx by philosophers like Lukács and Horkheimer was unimportant). The quarrel between Neo-Kantianism and phenomenology was not only systematic but historical as well. The battle was carried, especially by Heidegger, to the interpretation of the classical philosophical texts. The most important text was the work of Kant, the Neo-Kantian interpretation of which was then fundamentally challenged not only by Heidegger but by Scheler, Hartmann, Heimsoeth, and others.

But also of importance was the reading of Aristotle and Plato. The predominant Neo-Kantian view was to dismiss Aristotle on behalf of Plato. Gadamer reminds us that Hermann Cohen used to handily dispose of Aristotle by calling him an 'apothecary'.¹² More important for the interpretation of Plato at this time in Germany was the Plato interpretation of Natorp, whose *Platos Ideenlehre* ('Plato's doctrine of ideas') provided the Neo-Kantian interpretation of Plato.¹³

Natorp argued two major theses which were closely related: first, the proximity of Plato to Kant, and, secondly, the idealistic stance of both Plato and Kant. The subtitle of the work is 'An introduction to idealism', by which Natorp means Plato's introduction to the transcendental idealism of Kant. For Natorp, Kant in fact accomplished what he said of himself with respect to Plato: 'we understand him better than he has understood himself' (A314/B370).¹⁴ Plato's 'doctrine' of ideas is interpreted by way of Kant's categories and transcendental ideas. Natorp insists again and again that 'the truth of that which is (*ta onta*) . . . is in the positings of thought [*Denksetzungen*]' (PI 133). The ideas are 'pure objects of thought [*reine Denkobjekte*]' and the 'proper possession of consciousness [*eigener Besitz des Bewusstseins*]' (PI 134). Being itself is finally 'positing in general [*Setzung überhaupt*]' (PI 335). *Logos* is interpreted as the positing of judgment. As the prominence of the term 'positing' (*Setzung*) in these few but representative citations suggests, Natorp's Kantianism was not unaffected by the idealist critique of Kant.¹⁵

In any case, for Natorp the single issue that ties together his reading of the Platonic dialogues is the question whether the ideas of Plato are to be understood in accord with Aristotle's critique as constituting a second independent realm of entities, a *hyperouranios topos*, or whether the ideas are to be understood rather as 'pure objects of thought' as the above citations suggest. As the latter, the Platonic doctrine of ideas introduces idealism into Western thought.¹⁶ The Aristotelian transcendent interpretation of the Platonic ideas is to be rejected for a transcendental interpretation.¹⁷ Because it is so important to find the transcendental in Plato where often the tradition had found the transcendent, even the famed statement of the *Republic* that the Good is 'beyond being' gives Natorp little pause. What might appear to be beyond thought, nonetheless 'lies in the region, in the genus of the thinkable'.¹⁸ Given this correction of the mistaken traditional and Aristotelian view of Plato, the transcendental Plato can be enlisted as an idealist in the quarrel between idealism and realism.

The early Heidegger understood the problem of interpreting Plato in precisely the terms set down by Natorp. Either the ideas reside in a place beyond the heavens or in transcendental subjectivity. Heidegger acknowledges in *On the Essence of Ground* (1929), perhaps in deference to Natorp's interpretation, that the tendency toward the latter is prefigured (*vorgebildet*) in Plato.¹⁹ Despite this prefiguration, however, Heidegger agrees with Aristotle's critique of the transcendent character of the ideas in Plato. Only later, according to Heidegger, through the mediation of Christianity do the ideas find their home in subjectivity and, finally, in the will to power. What Gadamer, the student of both Heidegger and Natorp, does in his recent work on Plato is, in part, to retrieve Natorp's critique of Aristotle's treatment of Plato to counter

Heidegger's Aristotelian critique of Plato. Gadamer's retrieval does not, however, claim Plato on behalf of Kant, as Natorp did.

What fundamentally is at stake in Natorp's and Heidegger's reading of Plato is the status of transcendental philosophy. Natorp identified his Neo-Kantian idealist philosophy with transcendental philosophy. This he opposes to the transcendent philosophy of the dogmatic Aristotelian tradition. The early Heidegger also hoped to develop an appropriate transcendental philosophy, but he opposed the idealism of Natorp and the Neo-Kantians. Where Heidegger differs from most of his contemporaries is that he did not take sides in the idealist–realist quarrel. He criticized both factions and proposed a transcendental philosophy that is neither idealist nor realist.²⁰ His fundamental thesis – that phenomenology is ontology – and his corresponding attempt to provide an ontological interpretation of Kant contributed to the confusion of the initial reception of his work. The transcendental and phenomenological status of his work as well as his dependence on Kant seemed to make him an idealist. Yet his attack on any philosophy of consciousness, be it Neo-Kantian or Husserlian, and his repeated invocation of Aristotle in an explicitly ontological project made him appear to be a realist. In his discussion of idealism and realism in *Being and Time* Heidegger rejects the usual alignment of Plato with Kant to align Kant with Aristotle.²¹ Thus though he would disagree with Natorp about Plato, he does, as we have just seen, acknowledge that the subjectivism of modern idealism is 'prefigured' in Plato. Plato starts us on the path to idealism.

Though Heidegger thinks that he has found an alternative to the either/or of idealism and realism, he is happy to consign Plato to this very alternative. Heidegger would escape the dilemma of the transcendental vs. the transcendent, but he allows Plato to be confounded by this same dilemma. This dilemma, I suggest but shall not argue here, is no more appropriate to Plato than to Heidegger. In sum, Heidegger pushes Plato in the opposing directions of Aristotle and Natorp. Plato is either Aristotle's Plato with the single idea of the Good in the place beyond the heavens or the Neo-Kantian idealist of transcendental subjectivity. These two differing views, according to Heidegger, mirror one another – just as Nietzsche mirrors Plato. They represent the dilemma of objectivism/subjectivism which modern philosophy cannot escape and which Heidegger proposes to resolve by eradicating it at its root in the metaphysics of Plato.

Let us begin our closer consideration of Heidegger's interpretation of Plato with the essay 'Plato's doctrine of truth', the only essay devoted

exclusively to Plato. Then we can turn back to the earlier and similar Plato interpretation to find its sources in Heidegger's own explicitly metaphysical project. We can illuminate thereby both the intentional ignorance of the later essay and the problems Heidegger grappled with in his early attempt to establish a scientific metaphysics.

The primary thesis of 'Plato's doctrine of truth' is that Plato transforms the notion of truth from unconcealment to the 'correctness' (*orthotes*) of sight and, accordingly, of 'expression' (*Aussage*). This transformation is exemplified in the allegory of the cave in the *Republic*. Such a transformation changes 'the place' of truth from a characteristic of beings or things themselves to a feature of human comportment toward things: 'The essence of truth gives up the characteristic of unconcealment. . . . In *orthotes*, the correctness of the look, lies everything. . . . Truth becomes *orthotes*, the correctness of perception and expression. In this transformation of the essence of truth a change of the place of truth occurs at the same time. As unconcealment, truth is still a characteristic [*Grundzug*] of the being itself. As correctness of the "look", however, truth becomes a characteristic [*Auszeichnung*] of the human comportment toward being [*Seienden*]' (PL 136–7).

This transformation of the understanding of truth is the cornerstone of the metaphysical tradition. With this view of truth, Plato, according to Heidegger, starts down the path that leads to the dilemma of modern philosophy and the subjectivism and humanism of contemporary thought. It was more than accident or convenience that led Heidegger to publish the second edition of this essay in 1947 with the *Letter on Humanism*. This 'letter' develops the charge of humanism that Heidegger makes in the Plato essay: 'The beginning of metaphysics in the thought of Plato is at the same time the beginning of "humanism"' (PL 142). Heidegger's objection to humanism is, of course, its subjectivism. This he ties closely to another theme prominent in his later thought – technology. Metaphysical thought is 'technical thought' wherein knowledge is subordinated to production – if not human production, then divine.

Heidegger knows full well that no simple identification of Plato with modern metaphysics can be made. He insists in this essay, for example, that the contemporary notion of value (*Wert*) is not at all appropriate to the Platonic notion of the good (*to agathon*). Nonetheless for Heidegger there is a kind of continuity of the tradition. Nietzsche is called in the Plato essay the 'most unbridled Platonist' (*zügelloseste Platoniker*) (PL 133). The transformation of truth in Plato is the great event that sets the way for modern subjectivism as evidenced, for example, in Nietzsche.

Though the late concession (1964) mentioned above acknowledges that the thesis about Plato's transformation of truth is mistaken, Heidegger does not in that lecture or anywhere else recant his description of the

traditional metaphysical notion of truth or his attribution of that notion to Plato. Accordingly this late concession affects not so much his Plato interpretation as his interpretation of the Pre-Socratics, and his attempt to find there the doctrine of truth as unconcealment. In the 'Seminar in Zähringen' (1973), for example, Heidegger takes up his older reading of Parmenides to revise it, and in the 'Seminar at Thor' (1969) he sticks essentially to his earlier critique of Plato. Here, rather than insist on Plato's transformation of the notion of truth, Heidegger suggests that Plato 'makes firm' or 'sets fast' (*festsetzen*) in a decisive way the interpretation of the Being of beings as 'presenting presence' (*anwesende Anwesenheit*) which is already to be found in the Pre-Socratics.²²

In the Plato essay Heidegger's primary argument for 'correctness' as the Platonic notion of truth concerns the Platonic *idea*. He urges that the essence of Plato's *idea* is appearance (*Aussehen* and *Schein*) and visibility. Through the *idea* the epistemological primacy of the metaphor of sight is supposedly established for the metaphysical tradition. Further, the ideas are fixed and immovable. Although in this essay Heidegger does not take his interpretation beyond the cave story to consider the discussion of the dialectic that follows it in the dialogue, he elsewhere suggests that the Platonic dialectic is basically categorization (*kategorieren*).²³ Accordingly, from the time of Plato and Aristotle the fundamental task of philosophy has always been to establish a table of categories, a list of ideas. Since the highest reality is *idea*, then according to Heidegger's view Plato's ontology renders Being (*Sein*) as essence or 'being-what' (*Was-Sein*). He comments that subsequent to Plato the true *esse* is *essentia* and not *existentia* (PL 131). Thus essentialism is established – of which nominalism is only the inverse. By introducing the concept of existence (*Existenz*) and its accompanying existentials in *Being and Time*, instead of the traditional categories, Heidegger sought a way out of the traditional impasse of essentialism or nominalism, objectivism or subjectivism, Plato or Nietzsche.

The obvious difficulty for Heidegger's interpretation of the cave allegory is the role of the sun which represents the Good. Here Heidegger is forced to consider the ontological import of the allegory which he for the most part ignores, as the critics have properly pointed out. When he first considers the sun, he acknowledges that the sun, as representative of the Good, has a double function. The sun not only provides light such that things may be seen, but the sun also gives warmth which maintains life. More strongly, it not only lets things be seen but it is their origin and cause: "The Good" maintains the appearing of the appearance, within which the presenting [*das Anwesende*], takes its stand in that which it is' (PL 135).²⁴

Only after Heidegger presents and argues his major thesis – that for Plato everything rests on the correctness of the look²⁵ – does he return

to this other aspect and acknowledge that Plato does nonetheless retain something of an ontological notion of truth, i.e., that truth is placed in the thing itself and not in the look: 'In a certain way nonetheless the "truth" must still hold fast as a character of the being [*das Seienden*], because the being as the presenting [*das Anwesende*] in the appearing has Being [*das Sein*] and this brings with it unconcealment' (PL 137).²⁶ The 'must' is indicative of the way, for Heidegger, Plato is forced against his own view to this acknowledgement – forced by the *Sache selbst*, as it were. Insofar as this runs contrary to Plato's primary view, there results an equivocation (*Zweideutigkeit*) on the notion of truth. In typically Heideggerian fashion the way things are (here, truth as unconcealment) shows through the covering over of it by metaphysics (here, Plato's correctness of the look). My quarrel with this aspect of Heidegger's interpretation is not with the suggestion that these two tendencies exist in Plato. They surely do. My complaint is that Heidegger does not deal with them more sympathetically. In fact, these two aspects of truth are just the two that Heidegger in *Being and Time* recognizes as necessary for any account of truth. There he accepts both as part of the phenomenon of truth and makes it his task to show how together these seemingly equivocal notions of truth together constitute the phenomenon of truth. Plato, like Heidegger, wants to provide a treatment of truth adequate to both these dimensions – dimensions that are not simply incompatible or equivocal. Plato is not singlemindedly fixed on truth as correctness.

In his argument for the thesis that 'everything rests on the look' Heidegger cites the statement from the allegory of the cave that the idea of the Good is itself the *kuria* (*Herrin*, mistress) of truth (517C 4). From this he goes on to suggest that the *idea* has the mastery of truth. In Heidegger's analysis *idea* becomes *blepein* which, in turn, becomes the 'look' (*Blick*). The 'look' has mastery. But this treatment of the text is not entirely satisfying, for it is not the *idea* simply that has mastery; it is rather the *idea* of the Good. Heidegger suggests that Plato, by making the *idea* of the Good 'mistress', places truth under the yoke of *idea*. It would be better to note that the yoke under which truth serves is not *idea* as such but the *idea* of the Good. In another Platonic metaphor, the truth is the offspring of the Good.

Heidegger's failure or refusal to adequately place this allegory in the larger context of the dialogue frustrates any reader of the *Republic*. Though Heidegger does deal briefly (PL 133–5) with the discussion of the Good and even refers to 509B, he ignores the famed statement by Socrates at 509B (when the sun allegory is introduced in the dialogue) that the Good is not being (*ousia*) but 'beyond being' (*epekeina tes ousias*). Certainly this makes it difficult to treat the Good simply as an idea. The ideas are presented by Plato as true being (*ousia*), but the Good is beyond being. It is the very cause (*aitia*) of being. As the source

of light the sun is more difficult to see than any thing. Rather it lets things be seen for what they are, while it itself remains, for the most part, unseen. Though Plato does call the Good an idea, unlike the other ideas it is never in the *Republic* called *eidos* as the others are.²⁷ Heidegger translated *eidos* as *Aussehen* or 'appearance'. In accord with this, the Good should not be understood as an appearance. Rather the Good presents no appearance. It is beyond the forms. It is their very ground. Heidegger, of course, recognizes its pre-eminence but sees it only as the pre-eminent idea, the idea *par excellence*. He uses the Platonic phrase – 'the idea of all ideas' (PL 133). He does not adequately attend to the significant distinctiveness of the Good.²⁸

This slighting of the difference of the Good from the other ideas is surprising in the context of the classical tradition wherein Neo-Platonism makes this distinction fundamental. But it is even more surprising in the context of the development of Heidegger's own thought. In the Marburg period, the period of the project of *Being and Time*, though Heidegger pays little attention to Plato, this phrase from the *Republic*, '*epekeina tes ousias*', is one of the most prominent and oft-repeated classical citations by Heidegger. Not only is the phrase frequent and used at important junctures in the argument of the lectures, this phrase provides the name for the sort of ontology – metontology – which Heidegger proposed for the completion of the project begun in the fundamental ontology of *Being and Time*. Given the importance of this phrase to the classical tradition and to Heidegger himself, its absence in this essay is quite obtrusive.²⁹

3

Two things are decisive for the interpretation of Plato presented in 'Plato's doctrine of truth'. First, the difference between the Good and the ideas is slighted, i.e., the *epekeina* is ignored. Secondly, notions of truth as correctness and as unconcealment are taken to be simply equivocal. The former is attributed to Plato, the latter to a more originary and more appropriate notion that shows through in spite of Plato. Looking at Heidegger's Plato interpretation by way of Heidegger's own development reveals both a critique of Plato that remains essentially the same and an earlier view that neither ignores the *epekeina* nor assumes the incompatibility of correctness and unconcealment. How can this be? Let us look first at the earlier Plato critique and then at the more significant philosophical issue concerning the *epekeina* and truth.

We should recall first of all that the early Heidegger was not as inimical to metaphysics as he became after his 'turn'.³⁰ Though *Being and Time* and *Basic Problems in Phenomenology* eschew the title of metaphysics,

in the last lectures at Marburg, *The Metaphysical Principles of Logic Beginning with Leibniz* (*Die Metaphysische Anfangsgründe der Logik im Ausgang von Leibniz*) Heidegger explicitly and repeatedly refers to his own philosophical project as metaphysics, composed of fundamental ontology and something he there calls metontology.³¹ The problem of the term 'metaphysics' in the early Heidegger is roughly comparable to the problem of Kant's use of the term. Both are sharply critical of the tradition of metaphysics and both propose to accomplish an appropriate metaphysics themselves. Both criticize the traditional metaphysics for being insufficiently scientific. With the turn, however, Heidegger abandons the incomplete project of *Being and Time*, abandons metaphysics, and abandons science.

The historical part of this early project (Part Two of *Being and Time*) was to be a destruction (*Destruktion*) of the history of ontology or metaphysics. The rhetoric of destruction is weakened considerably in the *Metaphysical Principles* when Heidegger comments that the ancients need not be overcome and wonders if critique is at all appropriate. What must be fought, he says, are the bad 'administrators' (*Sachwalter*) of the tradition.³² Needless to say, in the Plato essay as well as in these lectures Heidegger attacks not the contemporary interpretations of Plato but Plato himself. Nor is he always so modest with respect to his own place in the tradition. He does insist that the entire metaphysical tradition points to his own metaphysics of Dasein.³³

The principal chapters of Heidegger's destructive treatment of the tradition in *Being and Time* were to be devoted to Aristotle, Descartes, and Kant – the historical figures to whom Heidegger felt himself closest. This is less the case with Descartes but there Heidegger, as in the *Basic Problems*, was to examine Descartes' dependence on medieval scholasticism. Among the ancients it is Aristotle whom Heidegger favors. When in the lectures on truth in the winter semester of 1925/6 (the time when he was writing *Being and Time*) Heidegger attempts to counter the dominant Neo-Kantian notion of truth as judgment, he does so by first countering the contemporary notion with that of Aristotle and Aristotle's equation of Being and truth in the *Metaphysics* (Book Theta, 10).³⁴ Having undermined the contemporary notion with the more originary Aristotelian notion, he then goes on to criticize Aristotle. It seems fair to say that in his Marburg period Heidegger uses Aristotle not so much to criticize Plato as to criticize modern philosophy. He finds Aristotle appropriate for this task in part because of his acceptance of Aristotle's critique of Plato and in part because of the Neo-Kantian alignment with Plato. This is not to say that he attempted to simply follow Aristotle.³⁵ Rather Aristotle, too, was inadequate, especially with respect to the analysis of time. The source that provided the leverage against even Aristotle was, for the early Heidegger, Christianity, especially Paul's

eschatological and 'kairological' notion of time with its priority of the future.³⁶ While the young Heidegger criticizes the Greek philosophical tradition from the perspective of the Judaeo-Christian tradition assisted by Luther and Kierkegaard among others, he comes to see, while still at Marburg, that the continuity is more significant than the discontinuity. Thus he can say in *Basic Problems* (1927) that Plato's doctrine of ideas was tailor-made for the Judaeo-Christian world view.³⁷ He leaves Kierkegaard for Nietzsche, for whom Christianity is Platonism for the masses. The later Heidegger turns not so much to Christianity as to the Pre-Socratics for resources against the philosophical tradition. He later attributes his preference of Aristotle over Plato to the former's archaism.³⁸

The continuity that Heidegger finds between Greek philosophy and Christianity is a large one that incriminates Aristotle as well as Plato and is decisive for his critique of Plato and the identification of Plato with the entire metaphysical tradition. This continuity for Heidegger rests on the Greek understanding of Being as 'production' (*Herstellung*). Heidegger treats Aristotle's four causes as exemplary of the thesis. The constitution of any being is understood as analogous to the production of an artefact – involving material, design, agent, agent's purpose. Accordingly, essence (*Was-sein*), which translates *ousia*, means the 'production of the produced in the sense of the disposable present-at-hand'.³⁹ Two concepts are essential to this view of Being – production and being-present-at-hand (*Vorhandensein*).⁴⁰ By way of production, being-present-at-hand, Heidegger asserts, is the pre-eminent notion of Being throughout the Western tradition. God or the demiurge is the ultimate producer. Thus all metaphysics is onto-theological. This underlies our own contemporary technological frame of mind.

Though Heidegger himself chides those who would read Aristotle as a 'disguised Church Father' (*MP* 190), his own production thesis is consonant with the Christian appropriation of Greek philosophy. This is particularly apparent with respect to Plato in *Basic Problems*, when Heidegger makes the *epekeina* or, synonymously, transcendence his central theme. There he talks of Plato 'bumping up against' the *epekeina*, the phenomenon of transcendence. He acknowledges that with this problem: 'we understand . . . that philosophy has not made any further progress with its cardinal question than it had already in Plato. . . . [W]e are moving within one of Plato's fundamental problems' (*BP* 282–3, *Gp* 400). He does not develop an interpretation of 509B but he recognizes that it could undermine his production thesis. He dismisses this possibility in the following way: 'It appears as though our thesis that ancient philosophy interprets [B]eing in the horizon of production in the broadest sense would have no connection at all with what Plato notes as [the] condition of [the] possibility of the understanding of [B]eing. Our interpretation of ancient ontology and its guiding clue seems to be arbitrary.'

What could the idea of the good have to do with production? Without entering further into this matter, we offer only the hint that the *idea [tou] agathou* is nothing but the *demiurgos*, the producer pure and simple. This lets us see how the *idea [tou] agathou* is connected with *poiein*, *praxis*, *techne* in the broadest sense' (BP 286, Gp 405).⁴¹ Here Heidegger invokes the *Timaeus* to indicate the continuity of Platonism with Christianity much as the early Christian philosophers did. Similarly, in the Plato essay transcendence is interpreted theologically.⁴²

Nowhere in the Marburg lectures published thus far does Heidegger develop his critique of Plato, but in *Metaphysical Principles* he does indicate precisely how he was to criticize Plato two years later in 'Plato's doctrine of truth'. Here he lists six aspects of the transcendence of the Good. These include:

- (1) The Good is hard to see.
- (2) The Good is the cause or ground of the just and beautiful and their fellowship (*koinonia*).
- (3) The Good gives light so that things can be seen.
- (4) The Good grounds the inner possibility of truth and reason.
- (5) The Good is the principle (*arche*) of all.
- (6) The Good is above beings and their Being.

These six guide his own analysis of the transcendence of Dasein, yet Heidegger suggests that the third should provide the basis for the interpretation of the cave allegory: 'Here is where the cave allegory should be fully interpreted.'⁴³ This is exactly what he does when he sits down to write his essay on Plato.

In these lectures he touches briefly on the ontological problem of participation (*methexis*) as suggested in (5) and (6) above – something he avoids for the most part in the later Plato essay. The question is unavoidable Heidegger says: 'Is the world a realm of ideas, a *hyperouranios topos*, toward which reason, which has sunk into Dasein, looks? Or is the world the entirety of ideas which are in the subject from its birth?' (MP 234). As we noted above, this way of putting the question is precisely the way it was put by Natorp in his Plato interpretation. Heidegger does not take up the latter question, but the context suggests its inappropriateness. Concerning the former question Heidegger comments that Aristotle saw that such an approach leads to a doubling of beings (MP 235). This comment suggests that Plato did not see it.

In either case the ancient view centers on 'intuition' (*Anschauung*) such that the way is prepared for the modern subject-object relationship. Heidegger is careful not to accuse Plato or Aristotle of having this problem *per se*. Earlier in the lectures Heidegger comments that the problem of ancient philosophy and ontology cannot be dealt with adequately in terms of realism or idealism (a criticism of Natorp among

others) because the ancients' fundamental problem was ontological and not epistemological (*MP* 180). Nonetheless, the subjectivity of the subject is a critical problem for the ancients according to Heidegger and the resolution of the problem by means of intuition sets the stage for the modern epistemological problem. Heidegger is not careful in his Plato essay to distinguish the ancient ontological stance from the modern epistemological one, but the general thesis is the same in these Marburg lectures as in the later essay: the Platonic treatment of truth sets up the quagmire of subjectivism and objectivism. Had Heidegger pursued his own cautionary note about the difference between ancient ontological approaches and modern epistemological ones, had he examined the cave story under more aspects than the third of the six he recognized as possible, and had Heidegger been less ready to accept the demiurgic resolution of the *epekeina* question – then he would have been prepared to deliver a more appropriate reading of the cave story. Numbers (4), (5), and (6) are each as relevant for an interpretation of the cave story as (3), which Heidegger makes the principle of his own interpretation. But why should he have failed to provide such a reading, for which he had laid such excellent groundwork – and upon which his students would read Plato only to correct the reading of their teacher?

4

To answer this question requires attention to the systematic problems with which Heidegger struggled in the attempt between 1927 and 1931 to complete the ontological project begun in *Being and Time*. The published text of *Being and Time*, of course, constitutes only two thirds of Part One of a projected work of two parts. Part Two was to consist of historical studies, the 'destruction' mentioned above. The stumbling block for Heidegger, it seems, was not so much these historical analyses, which for the most part he delivered in lectures or published independently.⁴⁴ Rather, his principal difficulties lie in the concluding systematic section, which was to be entitled 'Time and being'. Of this section Heidegger later remarks 'Here everything is reversed.'⁴⁵ The significant 'turn' in Heidegger's thought took place shortly after he left Marburg for Freiburg to take Husserl's chair. He was then attempting to think through the projected reversal in the project of *Being and Time*. The turn taken was not the turn projected.⁴⁶

The recent publication of the lectures Heidegger gave at this time give us an indication of these difficulties. The two lecture series discussed above are especially helpful in this regard. A footnote to the first sentence of *Basic Problems* states that these lectures are a 'new working out of the 3d section of Part I of *Being and Time*'.⁴⁷ Albert Hofstadter

is surely wrong to suggest that they represent in effect the completion of the project, for they too provide only a fraction of what they project.⁴⁸ The lectures of a year later, the last Marburg lectures, do not set for themselves the task of developing the thematic of 'Time and being' as *Basic Problems* does, but they rather comment at a slight distance on 'The problem of being and time'. Both sets of lectures conclude with a reference to Plato.

In *Basic Problems* Heidegger sets for himself the task of establishing an appropriate concept or idea of Being itself by way of the resolution of four problems concerning such a concept. The four problems are the following:

- (1) the ontological difference of Being from beings;
- (2) the fundamental articulation of Being, i.e., the unity of whatness and howness (traditionally *essentia* and *existentia*) in the idea of Being;
- (3) the unity of the multiplicity or regions of Being; and
- (4) the question of truth.

The first three are aspects of the fundamental metaphysical problem that the young Hegel refers to as identity and difference, that medieval scholasticism treated by way of the analogy of Being, and that Plato discussed as the One and the Many. Heidegger poses these problems in terms of the apparent indifference of Being and Being's originary plenitude. The last of these four problems calls for an ontological basis for the understanding of truth.

Inevitably the most prominent theme of the lectures is not so much Being as such as the problem of understanding Being. This follows from *Being and Time* in which the often overlooked leading question asks after the meaning of Being (*Sinn von Sein*). It is we human beings as Dasein who must come to terms with Being. The systematic treatment of Being as such rests on the preparatory analytic of Dasein – the published text of *Being and Time*. In accordance with the treatment of the understanding in that work, all understanding is projective, i.e., any item is understood insofar as it is integrated into a larger projected, though not necessarily thematized, context. The understanding of Being as such is unlike the understanding of any particular being, however. Failure to recognize this ontological difference has, according to Heidegger, caused much of the greatest confusion in the history of philosophy. Not the least of these confusions is the projection by 'vulgar' metaphysics of a *Hinterwelt*, a second world behind this one. Though he does not do so here, Heidegger often accuses Platonism of just this.⁴⁹ It is in the context of just such discussions that Heidegger likes to insist on the transcendental status of the science of ontology – it is not the science of transcendent being but the transcendental science of Being. The con-

fusion between the two, he often points out, is apparent in Aristotle's two senses of 'first science' – the science of Being qua being or of first being. To resolve the former question by means of the latter gives us the production thesis of the present-at-hand.

Heidegger suggests the following succession of understanding for any ontological inquiry: the understanding of beings and the projection toward Being, the understanding of Being and the projection toward time. When this notion of projecting beyond Being toward time is first suggested in the lectures Heidegger develops it explicitly in terms of the Platonic *epekeina tes ousias*: 'What we are in search of is the *epekeina tes ousias*' (BP 285, Gp 404). That which is beyond Being and which Heidegger refers to as the *epekeina* is time. Here, however, the phenomenological analysis of time as the triadic 'ecstatic' unity of temporality (*Zeitlichkeit*), which *Being and Time* provided, is deemed insufficient. This analysis is retained but is to be deepened by finding the origin of temporality as *Zeitlichkeit* in temporality as *Temporalität*, a deeper a priori structure. This theme of temporality as *Temporalität* is tied directly to the interpretation of world, for the temporal world is that which goes beyond or transcends – it is the sought for *epekeina*. As worldly being, or Being-in-the-world, Dasein itself is called the transcendent: 'what is truly transcendent is the Dasein' (BP 299, Gp 425).

In this sense ontology is a science of transcendent being, but Dasein, not God, is the transcendent being. Transcendence is a finite transcendence. The 'of' in 'science of transcendent being' is both a subjective and an objective genitive and in a way that only the last Marburg lectures make clear. There, commenting on the science of metaphysics, Heidegger suggests that the science has two principal parts: fundamental ontology and metontology. The former is equivalent to Part One of *Being and Time* – both the preparatory analytic of Dasein and the intended treatment of Being as such (Section 3: 'Time and being'). As in Kant, the 'critical' question of the limits of understanding is placed before the systematic metaphysics proper. Metontology is both beyond Being (*epekeina tes ousias*) and after (*meta*) the treatment of Being. It returns to Dasein and what Heidegger calls a metaphysics of existence where ethical questions might properly be raised. This analysis would be ontical, 'existenziell', as opposed to the earlier ontological and 'existenzial' treatment of *Being and Time*. The primary theme of this ontical study of the human was to be freedom. In classical terms the *epekeina* of Plato was to be interpreted through the *hou heneka*, the final cause, of Aristotle. Heidegger never worked out this metontology because he never completed to his own satisfaction the treatment of Being as such.

A decisive problem Heidegger faced with respect to the idea of Being itself was that of truth. Though the *Basic Problems* does not get beyond the first of the four main problems mentioned above, the lectures

conclude by expressing concern about a certain aspect of the truth question, i.e., the problem of the objectification of the science of philosophy. How does the treatment of truth provided in *Being and Time* apply to the work itself? The objectification inherent in the other sciences does not present the difficulty that such objectification does for philosophy, since the 'positive' sciences properly have objects. The 'object' of philosophy is primarily Being itself which is not an 'object' as such. It is rather no thing – hence the theme of the Inaugural address at Freiburg, 'What is metaphysics?'. Heidegger's question concerns how the pre-thematic and non-objective awareness of Being can be thematized, i.e., objectified. In concluding this lecture series (*Basic Problems*) Heidegger appeals to the Platonic notion of reminiscence yet adds a cautionary note: 'Here we must in all sobriety understand clearly that temporality is in no way something that is to be beheld in some superabundant and enigmatic intuition (*Intuition*); it discloses itself only in conceptual labor of a specific sort. But also it is not merely hypothetically supposed at the beginning without our having some vision (*Blick*) of it itself' (BP 327, Gp 465). What are we to make of the suggestion that we have a vision of, perhaps better, a glance (*Blick*) at Being but no 'superabundant and enigmatic intuition'? The latter is what Heidegger takes Plato to have offered us. The lectures end by citing approvingly Kant's attack on the Plato of the seventh letter as an enthusiast. Plato's 'conceptual labor' was insufficiently rigorous.

This problem of the objectifying character of the science of philosophy is apparent, though inexplicit, in *Being and Time*.⁵⁰ There is, as I have pointed out elsewhere, a methodological indifference that makes phenomenological analyses possible; yet indifference is everywhere attacked as the fault of a metaphysical tradition which takes Being merely as the present-at-hand.⁵¹ Consonant with *Being and Time*, we must ask how the silent and differentiated voice of conscience can be given a seemingly indifferent voice? Or, as *Basic Problems* frames the question, how can the apparent indifference of Being to its modes and regions be understood not as the nothingness of indifference but as the richness of a source (*Ursprung*)?

The resolution of this question that *Being and Time* anticipates seems to rest on the distinction of the originary and derived levels of truth. Heidegger writes there that the notion of truth as propositional and expressive is not mistaken. Truth does take this form. But this form of truth is based on a more fundamental and 'originary' truth experience – truth as unconcealment. Similarly Heidegger does not simply throw out the traditional notion of truth as adequation. He, like Kant, expressly adopts such a notion and then asks 'what are the conditions of the possibility of truth being such?'

Heidegger's analysis moves from the propositional and '*adaequatio*'

level to the higher ontological level – from correctness to unconcealment. He nowhere, however, successfully shows how the move back down from the ontological to the ontical and propositional level is possible.⁵² This latter move would be of great importance in relating the science of philosophy to the positive sciences. Heidegger's lecture 'Phenomenology and theology' shows that he has not adequately worked out this relationship of philosophy to the positive sciences.⁵³ But more importantly this move is essential to the self-justification of ontology as a science, i.e., as objectified and thematized.

The difficulty in making this move is reflected in the systematic difficulty of moving from fundamental ontology to the proposed metontology, for the doctrine of Being is not developed by Heidegger with the conceptual rigor that he himself demands. A concept or 'idea' that is not merely indifferent is not worked out satisfactorily. Had it been worked out, there remains the problem of the move back down to Dasein. Heidegger plays here with the German terms '*Kehre*' and '*Umschlag*' and the Greek *metabole*. This last problem is rather like that posed by Glaucon in the *Republic* concerning the cave story: 'Do you mean that we must do them this wrong and compel them to live an inferior life [i.e., the life in the cave] when the better is in their power [i.e., the life under the sun]?' (520 D). This is the political reflection of the methexis problem in Plato. *Contra* Heraclitus, for Plato and Heidegger the way up and the way down are not the same. Heidegger's silent voice of conscience finds no adequate scientific thematization. Soon hereafter in the *Introduction to Metaphysics* Heidegger abandons the claims of philosophy to scientific status. Soon thereafter he abandons philosophy for thought (*Denken*) which is the nearest neighbor to poetry.

After leaving Marburg in 1928 Heidegger gave lectures on the theme of truth during the winter semester of 1930/1. Though these lectures have yet to be published, we have from the lectures both the Plato essay and the essay 'On the essence of truth'. The theme of science (*Wissenschaft*) is abandoned but the question of the possibility of the correctness of an expression or proposition in a 'ground' or deeper (higher) ontological level remains the same. As before, this ontological ground is Being itself, the questioning of which is a question about the whole. The appropriateness of the answer can find no external measure or Archimedean point. Here Heidegger offers for the thought of philosophy the '*Gelassenheit der Milde*' – the mildness of letting beings be.⁵⁴

Within the tradition there have been perhaps no two thinkers more fully aware than Plato and Hegel of the problems that accompany the task of

philosophy precisely because philosophy demands the truth of the whole. Hegel's critique of representational thought, which Heidegger takes up and which exhibits itself in the problem of the objectification of scientific language, follows from this very concern. Plato in his own dialectical and dialogical way faced this same problem. Had Heidegger hearkened less to Hegel and his demand for conceptual rigor and more to the irony of Plato, he might have recognized a proximity of his own thought to that of Plato which would have undermined his sharp critique.

He could have learned more from Natorp in this regard – not only about the inappropriateness of ascribing the doctrine of two worlds to Plato but also of the significance of *eros* for Plato. In his introduction to *Metaphysical Principles* Heidegger in a paragraph skips through the history of philosophy mentioning the key conceptions concerning subjectivity in Parmenides, Plato, Aristotle, Descartes, Kant, and Hegel. For Plato he mentions *logos* and *psyche*. Now Natorp titled his appendix to the second edition (1920) of his *Platons Ideenlehre* 'Logos–Psyche–Eros'. The absence of any attention to *eros* in Heidegger's comments on Plato is perhaps the most remarkable feature of his Plato interpretation. It is remarkable not only in that it is an important central theme in Plato or that the notion played an important role in the contemporary debate on Plato (Natorp, for example) but rather in the fact that this notion is very like Heidegger's own notion of transcendence.

As suggested above, both *Metaphysical Principles* and *On the Essence of Ground* culminate in a treatment of the freedom of Dasein – a theme in itself very unPlatonic. But the concept of freedom as transcendence is developed, commensurate with *Being and Time*, in terms of weakness (*Ohnmächtigkeit*) and necessity – an analysis that is more classical than modern. Further, though freedom is central to Heidegger's analysis, the will is not. For this analysis of Dasein as free and transcendent being, we are prepared by the treatment of Dasein as temporal being. Temporality is explicated by means of 'ecstasy' – Dasein's standing outside itself in a temporal world. This, Heidegger suggests, is the origin of the derivative notion of intentionality as developed by Husserl and first introduced by Plato when Plato suggests that all *logos* is a *logos tinos* – a *logos* of something. One should not, according to Heidegger, explain transcendence by means of intentionality but rather should explain intentionality by means of transcendence. But Heidegger does not see that, rather like his own notion of transcendence that grounds intentionality, so too Plato's notion of *eros* grounds *logos*. In the 'erotic mania' of philosophy one comes to stand outside oneself and in the truth. Heidegger would call this the ecstatic character of Dasein.⁵⁵

We must recognize that the fundamental problem that Heidegger was grappling with as he struggled with the completion of *Being and Time* and formulated his critique of Plato is the problem of truth. He wanted

to avoid both naive objectivism and theologism. He also wanted to avoid the subjectivism found, for example, in Nietzsche, Natorp, and Sartre. He hoped to establish an understanding of truth that was neither transcendent in the 'other worldly' sense nor transcendental in the sense of the Neo-Kantians – alternatives, in my view, equally inappropriate to Plato. Truth, for Heidegger, is not to be a matter of positing by the subject. It requires a measure (*Mass* or *Massstab*). Yet with regard to the self-grounding character of the truth of the whole, with which the science of philosophy concerns itself, the measure cannot be external to the truth. For Heidegger the truth authenticates itself in the event of its unconcealment. The 'vision' (*Blick*) which Heidegger acknowledges as an aspect of this event is like the Platonic intuition which he criticizes. It is entirely appropriate that Heidegger should try to illuminate this 'Blick' through Plato's notion of reminiscence. Heidegger's inability to work out thematically the pre-thematic 'Blick' of Being together with his critique of 'sight' as the appropriate metaphor for truth as unconcealment leaves him waiting for the voice of Being.

Had he attended to the notion of the Good and man's erotic attachment to it, he might have noticed that for Plato the transcendence of the Good (*Republic*) is to be reconciled with the beautiful symmetrical measure of the mixture of life (*Philebus*). The Good is the mixture which the human in its weakness and finitude longs to attain.

The recognition of this proximity to Plato does not deny their very significant differences. On the contrary, it lets us see more clearly their opposition, which can be located most simply in the eternity of the 'Blick' for Plato and the historicity of the 'Blick' for Heidegger. Heidegger's understanding of reminiscence as '*die gewesende Zukunft*' (the future in the process of becoming past) is, taken by itself, Platonic. That to which man erotically aspires (Heidegger's projection of one's ownmost possibility) is the recovery of that which one once was. We remember what we are going toward.⁵⁶ But Heidegger allows himself no myth that introduces the suprahistorical, as Plato consistently does.

We saw how, for Heidegger (early and late), the demiurgic myth of the *Timaeus* incriminates Plato in 'production' metaphysics and onto-theology. Yet there is a late recognition by Heidegger (albeit expressed in the third person) of the proximity of Plato to his own thought wherein his usual critique is at least partially suspended. It occurs in the same publication in which Heidegger declares once again that metaphysics is Platonism. In the 'Summary of a Seminar on the Lecture "Time and Being"' the early Plato is exempted from the line of thought that runs from the Greek philosophical notion of *poiesis* through *creatio* to *Setzung*. Here Heidegger acknowledges that in the light metaphor of the Platonic *parousia* there is no *poiesis* or making (*Machen*): 'In this he [Plato] is

undoubtedly close to Heidegger.⁵⁷ Perhaps in the end Heidegger did learn something about Plato from his own students.⁵⁸

Notes

1 In the lecture 'Das Ende der Philosophie und die Aufgabe des Denkens' Heidegger claims: 'Durch die ganze Geschichte der Philosophie hindurch bleibt Platons Denken in abgewandelten Gestalten massgebend. Die Metaphysik ist Platonismus.' This lecture is published in *Zur Sache des Denkens* (Tübingen: Niemeyer, 1969), 63; in English translation by Joan Stambaugh, *On Time and Being* (New York: Harper & Row, 1972), 57. Heidegger makes the same claim in *Nietzsche* (Pfullingen: Neske, 1961), 2:222.

2 This essay was first published in 1942. In 1947 it was published in book form with the *Letter on Humanism*. It is cited here from *Wegmarken* (Frankfurt: Klostermann, 1967). Though the essay has been translated, all translations used here are my own. Hereafter it is referred to as PL.

3 *Zur Sache des Denkens*, 78; *On Time and Being*, 70.

4 Friedländer objects to Heidegger's minimalization of the ontological aspect of the Good. He criticizes as well Heidegger's etymology of *aletheia* as *a-lethe*. He points out that Plato himself discusses its etymology in the *Cratylus* and renders it *ale-theia*, 'divine whirlwind'. He argues further that nowhere in the Pre-Socratics or in Homer is *aletheia* used in Heidegger's sense of *Unverborgenheit*. See Chapter 11 in vol. 1 of *Platon* (Berlin: DeGruyter, 1954).

Heidegger, who seldom responds to criticism, responded very briefly to Friedländer's criticism by way of a question in the lecture 'Hegel und die Griechen', (1958) published in *Wegmarken*, 271. He is not yet ready here to make the concession he makes six years later in the lecture 'Das Ende der Philosophie und die Aufgabe des Denkens'. There Heidegger admits: 'It is often and justifiably pointed out that the word *alethes* is already used by Homer only in the *verba dicendi*, in statement and thus in the sense of correctness and reliability, not in the sense of unconcealment' (*On Time and Being*, 70; *Zur Sache des Denkens*, 77).

5 See Walter Biemel's biographical study, *Martin Heidegger* (New York: Harcourt Brace Jovanovich, 1976), 15.

6 Gerhard Krüger, 'Martin Heidegger und der Humanismus', *Studia Philosophica*, 9 (1949): 93-129. Krüger's principal work on Plato is *Einsicht und Leidenschaft: Das Wesen des Platonischen Denkens*, 4th ed. (Frankfurt: Klostermann, 1973).

7 Stanley Rosen, 'Heidegger's interpretation of Plato', *Essays in Metaphysics* (University Park: Pennsylvania State University Press, 1970), 51-78. See also chapter 5 of his *Nihilism* (New Haven: Yale University Press, 1969).

8 Hans Georg Gadamer, *Die Idee des Guten zwischen Plato und Aristoteles* (Heidelberg: Winter, 1978), 7. This is now being translated into English by P. Christopher Smith. Here and elsewhere Gadamer indicates that the initial key to his reading of Plato was the rejection of the Aristotelian critique of Plato's 'Ideenlehre' by Paul Natorp as well as by J. Stenzel and N. Hartmann. Gadamer has published many articles on Plato. Most of these have been collected in two volumes: *Platos dialektische Ethik* (Hamburg: Meiner, 1983), and *Kleine Schriften* 3 (Tübingen: J. C. B. Mohr, 1972). Some of these have been collected and translated into English by P. Christopher Smith in *Dialogue and Dialectic* (New

Haven: Yale University Press, 1980). See also 'Plato and Heidegger', *The Question of Being* (University Park: Pennsylvania State University Press, 1978), 45–63.

9 The most recent addition to this critical consensus is William A. Galston's 'Heidegger's Plato: a critique of *Plato's Doctrine of Truth*', *Philosophical Forum*, 13 (1982), 371–84. He criticizes Heidegger's essay much like the criticisms mentioned above for inadequately providing the context for the allegory of the cave (for Galston, the political aspect is the most significant part of the context ignored), for focusing onesidedly on the epistemological issue, and for ignoring the difference between the ideas and the Good. Galston does not address the larger context of this essay in Heidegger's work.

10 See the chapter 'Heidegger's Will-not-to-will' in Volume Two of *Life of the Mind* (New York: Harcourt Brace Jovanovich, 1978). She places what she calls the 'reversal' between volumes 1 and 2 of *Nietzsche* (1939). I do not deny that there is evidence of the turn here, but I follow Heidegger himself and date the beginning of the turn with *Vom Wesen der Wahrheit* (1930).

11 See Gadamer's evocative treatment of philosophy in Marburg in the 1920's in his *Philosophische Lehrjahre* (Frankfurt: Klostermann, 1977). Gadamer adopts as a motto for his own autobiography the very motto that Natorp chose for his own: 'De nobis ipsis silemus' – which is the motto Kant borrowed from Francis Bacon for the *Critique of Pure Reason*. Gadamer concludes his recollection of Natorp as follows: 'Lassen Sie mich mit einer persönlichen Erinnerung schliessen: wenn wir jungen Leute mit dem pietätlosen Blick der Jugend den kleinen eisgrauen Mann [Natorp] mit den grossen aufgerissenen Augen, in seinem Lodencape von wahrhaft monumentaler Unscheinbarkeit, des öfteren in der Begleitung des jungen Heidegger der Rotenburg heraufwandern sahen – der jüngere dem ehrwürdigen Greis respektvoll zugewandt, aber meist beide in langen, tiefen Schweigen, dann rührte uns in solcher stummen Zwiesprache zwischen den Generationen etwas von Dunkel und Helligkeit der Einen Philosophie an' (67–8).

12 Gadamer, 'Martin Heidegger und die Marburger Theologie', *Kleine Schriften* 1 (Tübingen: J. C. B. Mohr, 1967), 84, translated by David E. Linge in *Philosophical Hermeneutics* (Berkeley: University of California Press, 1976), 201.

13 Paul Natorp, *Platos Ideenlehre* (Leipzig: Meiner, 1921), first published in 1902, hereafter cited in the text as *PI*. The second edition, which left the text untouched but added notes and an appendix, substantially modified the interpretation, rendering Plato less Kantian and more Plotinian.

14 In the Preface to *Platos Ideenlehre* Natorp writes that 'the introduction to Plato is the education into philosophy. . . . Philosophy, however, according to its strictest historical concept is nothing other than idealism' (V). Kant is for him the highest fulfillment of the philosophical tradition. In the appendix added to the second edition Natorp writes defensively 'Whoever completely holds a Marburger capable of wishing to show that Plato was a Kantian according to Marburg observance falsifies the entire meaning of the philosophical effort, which one honors with the title "Marburg school"'. In the same context he asserts: 'Whoever can overlook the elements (*Züge*) in Plato that look forward to Kant and those in Kant that look back to Plato must have understood them both equally poorly' (462).

15 Natorp was aware of the importance of post-Kantian idealism for his own Kantianism. Gadamer comments that the root of Natorp's Neo-Kantian view of Plato lies in Hegel's dialectic of the 'verkehrten Welt' which thinks of the supersensible world of the understanding as a 'tranquil realm of laws' (*ruhiges Reich von Gesetzen*). Thereby the Platonic idea is understood through the modern notion of a law of nature. In *Philosophische Lehrjahre*, 66.

16 *PI* VII: 'Aber den Begriff des Idealismus haben wir gemein, und die Grundansicht, dass der Idealismus, der von den Ideen Platos, und nicht etwa Berkeleys, benannt ist, auch in Platos Ideenlehre seine erste, ursprünglichste, fast muss man sagen unmissverständlichste Ausprägung gefunden hat.'

17 According to Natorp Aristotle's critique rests on an early and undeveloped notion of the ideas as presented, for example, in the *Phaedo*. Referring to them there as *auto kath' auto* (66A, 78D, 100B), Plato gives ground for such an understanding. Assuming a developmental view of Platonic doctrine, Natorp urges that this notion is more Socratic than Platonic. He summarizes his own argument as follows: 'We will see how he [Plato] in the *Theaetetus*, the *Phaedo*, the *Symposium*, and the *Republic* comes step by step closer to the overcoming of the transcendent on behalf of the transcendental, in order to achieve it in the *Parmenides*' (*PI* 88). For Natorp the telling dialogue is the *Parmenides*. Aristotle, according to his view, leaves the problem too early; he lacked the necessary dialectical perseverance (*PI* 224). The basis for this lack is the 'eternal inability of dogmatism to transport itself to the standpoint of critical philosophy' (*PI* 385).

18 *PI* 191: 'Auch für uns gibt es hier Einiges zu verwundern. . . . Aber hier sollen wir uns gar etwas denken, das über beides, das Denken und das gedachte Sein hinaus liegt. Aber doch wiederum liegt es im Bereiche, in der Gattung des Denkbaren.' Elsewhere (*PI* 463) Natorp suggests that the *epekeina* of Plato finds its clear formulation in Kant's notion of the transcendental. This reading of the *epekeina* is substantially modified in the notes (nn. 6, 14, 16) to the second edition. Here the ideas are beyond the distinction of the subjective and objective (526 n. 6). And the Good ascends to the sphere of the Plotinian One (532 n. 14), which lies above the twofold correlations of knowledge and object of knowledge, theory and practice, and so on.

19 *Wegmarken*, 57. This has been translated by Terrence Malick under the title *The Essence of Reasons* (Evanston: Northwestern University Press, 1969), 95.

20 Idealism is a broad target. Heidegger would criticize thereby Husserl as well, at least so far as both Husserl and Neo-Kantianism establish an ultimate ground in the transcendental ego. Heidegger identifies the primary difference between Neo-Kantianism and Husserl as lying in their respective notions of truth. For the Neo-Kantians truth lies in judgment. For Heidegger, Husserl's notion of intentionality is a more originary notion, one that leads to Heidegger's own notion of truth. In this regard see especially Heidegger's *Die Grundprobleme der Phänomenologie, Gesamtausgabe* (Frankfurt: Klostermann, 1975), 24: 285–6; in English translation by Albert Hofstadter: *The Basic Problems of Phenomenology* (Bloomington: Indiana University Press, 1982), 201. Hereafter these will be cited respectively as *Gp* and *BP*. In the *Logic* lectures of 1925–6 (*Gesamtausgabe* 21: 60) Heidegger suggests that Husserl initially took up the notion of idea and ideal being in a Platonic way influenced by Lotze but soon saw through it and gave it up. Yet in the still unpublished *Beiträge* (1936–8) Heidegger accuses pre-hermeneutical phenomenology of understanding truth as the correctness of representation. See O. Pöggeler, 'Heideggers Neubestimmung des Phänomenbegriffs', *Neuere Entwicklungen des Phänomenbegriffs, Phänomenologische Forschungen* vol. 9 (Freiburg: Alber, 1980), 155.

The suggestion, then, that Heidegger's critique of Plato is also a critique of Husserl is appropriate in a certain way, but the thesis of Douglas McGaughy that the Plato essay is a response to an essay by Eugen Fink, who used the cave story to interpret Husserl's phenomenology is surely wrong, for Fink's essay ('Was Will die Phänomenologie Edmund Husserls') was first published in 1934

(*Tatwelt* 10), three or four years after Heidegger wrote the Plato essay. McGaughey was misled by the later publication date of the Heidegger essay. See Douglas McGaughey, 'Husserl and Heidegger on Plato's cave allegory: a study of philosophical influence', *International Philosophical Quarterly*, 16 (1976): 331–48.

There is an extremely important but often unnoticed close relationship between the thought of Natorp and Husserl. In important reviews of the *Logische Untersuchungen* and of the *Ideen* Natorp proclaimed the proximity of their positions. Iso Kern argues that the single most important source of Husserl's development after 1920, i.e., Husserl's development of genetic phenomenology, was the work of Natorp. See Iso Kern, *Husserl und Kant* (Den Haag: Nijhoff, 1964), especially 326–73.

21 *Sein und Zeit* (Tübingen: Niemeyer, 1967), 208; in English by Macquarrie and Robinson, *Being and Time* (New York: Harper & Row, 1962), 251.

22 See *Vier Seminare* (Frankfurt: Klostermann, 1967), 75. Decisive for the late Heidegger's comments about Plato and the Pre-Socratics is Heidegger's shift away from the question of truth. In some of his last published comments (*Vier Seminare*, 82) he describes his own pathway of thought as having three phases. The leading questions for these phases are the following: (1) the meaning of Being (*Sinn von Sein*), (2) the truth of Being (*Wahrheit des Seins*), and (3) the topology of Being (*topos des Seins*). The Plato essay was written as Heidegger began the second phase. According to Heidegger in *Vier Seminare* (134) *aletheia* (unconcealment) has nothing to do with *Wahrheit* (truth).

See Pöggeler's comments on Heidegger's move away from *Wahrheit* as his leading question in "'Geschichtlichkeit" im Spätwerk Heideggers', *Heidegger und die hermeneutische Philosophie* (Freiburg: Alber, 1983), 160–1; and also his 'Zeit und Sein bei Heidegger', *Zeit und Zeitlichkeit bei Husserl und Heidegger, Phänomenologische Forschungen*, 14 (Freiburg: Alber, 1983), 186.

23 *Neitzsche* 1: 529ff. See Rosen's apt criticism of this view, 'Heidegger's interpretation of Plato', 64–5.

24 "'Das Gute" gewährt das Erscheinen des Aussehens, worin das Anwesende in dem, was es ist, seinen Bestand hat.'

25 PL 136: 'An der *orthotes*, der Richtigkeit des Blickens, liegt alles.'

26 'In gewisser Weise muss Platon jedoch die "Wahrheit" noch als Charakter des Seienden festhalten, weil das Seiende als das Anwesende im Erscheinen das Sein hat und dieses die Unverborgenheit mit sich bringt.'

27 Gadamer points this out in *Die Idee des Guten zwischen Plato und Aristoteles*, 20–1.

28 One could perhaps defend the narrowness of Heidegger's interpretation in the following way. It is impossible to adequately provide the context for this allegory in the space of a lecture or a short essay. Heidegger is interested here in the problem of truth, not the problem of Being. Thus the objection that the ontological significance of the sun is not adequately dealt with is irrelevant, especially since this famous phrase stands outside the text of the cave allegory. Such a defense, however, ignores that precisely what Heidegger wanted to escape was such a distinction of truth and Being. His charge against Plato is that Plato was the decisive historical thinker to drive the wedge between truth and Being. Thus my criticism of Heidegger's interpretation is not that he failed to provide the full context but that he failed to provide the relevant context – that which undermines his thesis. In the Plato essay (PL 141) Heidegger does briefly consider the Good as highest cause and explains it away as theological. As we shall see

below, this fits with Heidegger's 'productivity thesis' concerning Greek ontology which Heidegger worked out in Marburg.

29 For Heidegger's explicit mention of the *epekeina* see *Gp* 401–5, 425, 436 (*BP* 283–6, 299, 307); *Von Wesen des Grundes in Wegmarken*, 56–8, in English 92–9. See also the last Marburg lectures from the summer of 1928: *Metaphysische Anfangsgründe der Logik im Ausgang von Leibniz, Gesamtausgabe* (Frankfurt: Klostermann, 1978) 26: 143, 237, 246, 284. Hereafter these lectures will be referred to in the text as *MP* (*Metaphysical Principles*).

One can identify, as Gilson does in *Being and Some Philosophers* (Toronto: Pontifical Institute, 1949), two primary developments in the Western metaphysical tradition with respect to the doctrine of Being and the understanding of God. The one thread of development identifies God with Being and finds its root in Aristotle. Biblically Yahweh's identification of himself to Moses in the burning bush as 'I am who am' is for this school fundamental. The other line of development begins with the *epekeina* of Plato. It finds its most significant development in the Neo-Platonism of Plotinus. This is taken up by Augustine, the Pseudo-Dionysius, and Meister Eckhart. For Eckhart, to be does not belong to God. Heidegger is not concerned with a doctrine of God. The few early remarks by Heidegger about God characterize Him as a being among beings. But the significance of Augustine and Eckhart for the early Heidegger is well-documented. *Dasein* is often described provocatively in phrases traditionally assigned to God. Most dramatically, in the Introduction to *Sein und Zeit* *Dasein* is called the '*transcendens schlechthin*' (the simply transcendent), and, further, *Dasein*'s essence is said to be its existence. So too, *Dasein*'s understanding of Being rests on a projection beyond Being (the *epekeina*). *Dasein*, in the transcendence of its freedom, is identified with the *epekeina*.

30 Heidegger's relationship to metaphysics after he turns away from his own explicitly metaphysical project is not a matter of simple opposition and rejection. Metaphysics, for Heidegger after the turn, is both nihilism and the fate of Western thought. As such, metaphysics is not a matter for acceptance or rejection. The complexity of his relationship to metaphysics after the 'turn' cannot be developed here. In the 'Introduction to *What is Metaphysics?*' (1979) Heidegger discusses the relation of thought (*Denken*) to metaphysics primarily in terms of 'overcoming' (*Überwindung*). In 'The question of being' (*Zur Seinsfrage*, 1955) 'overcoming' takes place within the 'getting over' (*Verwindung*) of metaphysics (*Wegmarken*, 245). In the lecture 'Time and being' (1962) Heidegger by way of conclusion says: 'Therefore, our task is to cease all overcoming, and leave metaphysics to itself' (*Zur Sache des Denkens*, 25; *On Time and Being*, 24).

31 See especially the appendix ('Kennzeichnung der Idee und Funktion einer Fundamentalontologie') to Section 10 ('Das Problem von Sein und Zeit').

32 *MP* 197; one can find similar comments in the later Heidegger, for example, in the *Letter on Humanism* (*Wegmarken*, 176) and in *Vier Seminare*, 75.

33 *Gp* 106: 'Es ist aber auch deutlich geworden, dass die Ontologie des *Daseins* das latente Ziel und die ständige mehr oder minder deutliche Forderung der gesamten Entwicklung der abendländischen Philosophie darstellt' (*BP* 75).

34 *Logik: Die Frage nach der Wahrheit, Gesamtausgabe*, vol. 21 (Frankfurt: Klostermann, 1976). Though Heidegger's critique of truth as judgment is oriented primarily around Lotze and secondarily toward Rickert, this critique also applies to Natorp. These lectures ignore Plato but wrestle with the fairly standard interpretation of Aristotle based primarily on *De Interpretatione* that sees truth as judgment for Aristotle as well. Heidegger would counter this with his reading of *Metaphysics*, Theta 10, which is also invoked in the Plato essay (PL 138).

For Heidegger these two sources in Aristotle represent the very equivocation (*Zweideutigkeit*) on truth that he discerns in Plato.

35 Nor do I mean to say that Heidegger did not see important agreements between Aristotle and Plato. This essay does not explore Heidegger's agreement with Aristotle's critique of Plato since in the primary essay under consideration Heidegger insists on the fundamental agreement between Plato and Aristotle on the two major theses: (1) the equivocation on the notion of truth, and (2) the theological interpretation of transcendence.

Heidegger came to Marburg in 1923 on the strength of an unpublished essay which interpreted Aristotle phenomenologically. The essay was sent to Natorp, who held the chair at Marburg, via the mediation of Husserl, for whom Heidegger was the Assistant in Freiburg. It was represented as the introduction to a large work on Aristotle. Of this essay and Heidegger's frequent teaching of Aristotle at Marburg Gadamer writes: 'At that time I was strongly influenced by Heidegger's interpretation of Aristotle, the real intention of which was still not completely evident, namely, its critique of ontology, and which in essence repeated Aristotle's critique of Plato in the form of an existential, situation-oriented philosophical critique of the idealist tradition' (*Dialogue and Dialectic*, 198). In the *Prolegomena* lectures of 1925 (*Gesamtausgabe* 20:23) Heidegger places his own work in the context of the Aristotelian school of the anti-Hegelian Trendelenburg, whose students included both Brentano and Dilthey. See also in this regard Gadamer's autobiography *Philosophische Lehrjahre*, 24, 212ff., and his essay 'Martin Heidegger und die Marburger Theologie', 82-92; as well as Thomas Sheehan's, 'Heidegger's early years: fragments for a philosophical biography', *Listening* 12 (Fall 1977), 3-20.

36 'Kairological' is from St. Paul's term *kairos* (= (sacred) time), e.g., Rom 13:11. For the significance of Christianity for the early Heidegger see the following: Otto Pöggeler, *Der Denkweg Martin Heideggers* (Pfullingen: Neske, 1963), especially 36-45; Thomas Sheehan, 'Heidegger's "Introduction to the Phenomenology of Religion"', *The Personalist*, 60 (1979): 312-24; Karl Lehmann, 'Christliche Geschichtserfahrung und ontologische Frage beim jungen Heidegger', *Philosophisches Jahrbuch*, 74 (1966): 126-53; Hans Georg Gadamer, 'Martin Heidegger und die Marburger Theologie' and 'Heidegger and the history of philosophy', *Monist*, 64 (1981): 423-44; and 'Die religiöse Dimension in Heidegger', *Archives de Philosophie*, 34 (1981), 271-86. These three are reprinted in Gadamer's *Heideggers Wege* (Tübingen: J. C. B. Mohr, 1983).

37 Gp 168: 'Die antike Ontologie war in ihren Fundamenten und Grundbegriffen trotz anderer Ursprünge der christlichen Weltauffassung und Auffassung des Seienden als ens creatum gleichsam auf den Leib zugeschnitten' (BP 118). In *An Introduction to Metaphysics* translated by Ralph Mannheim (New Haven: Yale University Press, 1959), 106, lectures from 1935, Heidegger states: 'Nietzsche was right in saying that Christianity is Platonism for the people.' For the German, see *Einführung in die Metaphysik* (Tübingen: Niemeyer, 1953), 80. He refers here to Nietzsche's comment in the Preface to *Jenseits von Gut und Böse* (*Beyond Good and Evil*).

38 See, for example, *Nietzsche* 2: 228 and 409; and 'Vom Wesen und Begriff der *Physis*', *Wegmarken*, 312.

39 Gp 153: 'Der Grundbegriff der *ousia* betont dagegen mehr die Hergestelltheit des Hergestellten im Sinne des verfügbaren Vorhandenen' (BP 109).

40 We cannot consider the relevance of Heidegger's notion of being-ready-to-hand (*Zuhandensein*) for his own understanding of production.

41 See also MP 237. Gadamer distinguishes the demiurgic activity of the

Timaeus from the Judaeo-Christian concept of creation in *Dialogue and Dialectic*, 163, 181, 193.

42 PL 141. Later, in the Nietzsche lectures Heidegger seems to take this back (*Nietzsche* 2: 225).

43 MP 144: 'Hier wäre das Höhlengleichnis ausführlich zu interpretieren.'

44 The Kant interpretation is in *Kant und das Problem der Metaphysik* (Frankfurt: Klostermann, 1929); in English translation by James Churchill, *Kant and the Problem of Metaphysics* (Bloomington: Indiana University Press, 1962). This book was a development of the lectures of the winter semester 1927/8: *Phänomenologische Interpretation von Kants Kritik der reinen Vernunft, Gesamtausgabe* 25 (Frankfurt: Klostermann, 1977). The interpretation of Descartes and medieval thought is provided, at least in part, in the *Basic Problems* lectures. The Aristotle section is least available. The closest attention to Aristotle from the Marburg period which is available can be found in the *Logic* lectures mentioned above (winter semester 1925–6).

45 *Letter on Humanism* in *Wegmarken*, 159: 'Hier kehrt sich das Ganze um.' In English translation by Frank Capuzzi in collaboration with J. Glenn Gray, *Basic Writings* (New York: Harper & Row, 1977), 208. I follow Heidegger here and disagree with Pöggeler who places the *Kehre* in *Sein und Zeit* not between Sections 2 and 3 of Part 1 but between Part 1 and Part 2, i.e., not between the preparatory analytic of *Dasein* and 'Time and being' but between the systematic ontology of Part 1 and the historical destruction of the tradition in Part 2. See his 'Heidegger's Topology of Being' in *On Heidegger and Language*, ed. Joseph Kockelmans (Evanston: Northwestern University Press, 1972), 120–1.

46 Was this shift in Heidegger's thought a 'turn' or a 'reversal'? Terminologically Kenneth Maly is correct to point out that Heidegger uses *Kehre* and not *Umkehr* or *Umkehrung*, and thus 'turn' or 'turning' is more appropriate than the commonly used 'reversal'. The one statement of Heidegger that runs contrary to this is the one just cited in the *Letter on Humanism* where the verb used is *umkehren*. See Maly's note to his translation of the later essay 'Die Kehre' in *Research in Phenomenology*, 1 (1971): 8. Heidegger briefly discusses the *Kehre* in the context of the project of *Being and Time* in the *Metaphysical Principles*, 201.

47 Gp 1: 'Neue Ausarbeitung des 3. Abschnittes des I. Teiles von *Sein und Zeit*.' Given the manner in which these texts are edited it is not clearly necessary that Heidegger authored this note, though since it was published before Heidegger's death we should be able to assume he approved it.

48 'Translator's Introduction', *Basic Problems*, xvii. Heidegger's introductory outline of the lecture series proposes 3 Parts, each with four sections. The lectures represent only Part One (historical) and a portion of section 1 of Part Two. Parts Two and Three were to resolve the problems set up historically in Part One. Very little of the project is accomplished.

49 Sometimes he talks of the 'tradition of Platonism' which might allow an important distinction between Platonism and Plato, but in *An Introduction to Metaphysics* he directly accuses Plato of this: 'It was in the Sophists and in Plato that appearance was declared to be mere appearance and thus degraded. At the same time being, as *idea*, was exalted to a suprasensory realm. A chasm, *chorismos*, was created between the merely apparent essent here below and real being somewhere on high' (106; 80 of the German edition). See also *Nietzsche* 1: 18; and *Nietzsche* 2: 541.

My objection to the widely held 'two worlds' interpretation of Plato does not ignore that the relationship between the visible and the intelligible constitutes

an important problem for Plato. Though the argument against the 'two worlds' interpretation of Plato cannot be made here (and there is certainly much to support such a view), I mention only that in the introduction to the discussion of the divided line and the cave, Socrates presents a simpler version of the divided line which has three parts and not two. *Doxa* is somehow between 'is' and 'is not'. Contrary to Parmenides, *doxa* both is and is not (477A–480A).

50 See the discussion of thematization in Section 69.

51 See my article "The problem of "indifference" in *Sein und Zeit*", *Philosophy and Phenomenological Research*, 43 (September 1982), 43–58.

52 The discussion of truth in Section 44 of *Being and Time* tries to show how the ontological condition of the possibility of the usual and undeniable notion of truth as 'adequation' or 'correspondence' is truth as 'unconcealment' and how correspondingly 'expression' (*Aussage*) and the 'apophantic as' are founded on interpretation (*Auslegung*) and the 'hermeneutic as'. It explains further how the more 'originary' notion, i.e., unconcealment, has been covered over by the traditional correspondence notion. It also attempts to show how falsity and untruth are possible, if *Dasein* ontologically is 'in the truth'. But the question how this originary notion of truth as unconcealment, presumably experienced in the authentic moment, is relevant to propositions, judgments, or science is not taken up. Perhaps after 'ascending' to the treatment of the meaning of Being as such, the 'descent' after the projected 'turn' would have addressed this question, i.e., perhaps in the terms of Heidegger's original project this question was more appropriate to 'metontology' than to 'fundamental ontology.' Ernst Tugendhat makes a similar argument in *Der Wahrheitsbegriff bei Husserl und Heidegger* (Berlin: deGruyter, 1970), 330–62.

53 In this lecture which dates from 1927 the relation between theology and philosophy is discussed as the problem of the relationship between two sciences – the positive science of theology and the ontological science of philosophy. Here Heidegger asserts that theology does not require philosophy to ground it but needs philosophy to look after its scientific status: 'Die positive Wissenschaft bedarf der Philosophie nur mit Rücksicht auf ihre Wissenschaftlichkeit' (27). Though theology needs philosophy, philosophy does not need theology. Philosophy is not to give 'direction' but only 'correction'; with faith philosophy jointly leads (*mitanleiten*) theology. This joint direction (*Mitleitung*) is characterized as 'formal-anzeigend' (formally pointing out [the ontological region]). Heidegger asserts that the content of theological concepts, e.g., sin, require a return to the ontological concept, e.g., guilt. He follows this by denying that the theological concept of sin is simply built onto the ontological concept of guilt. The source of the content for theology is the experience of faith. Nonetheless what philosophy corrects formally are the fundamental concepts of theology, for any theological concept presupposes an ontological one. The notion of tracing a concept back to an ontological presupposition which is formal and in opposition to the proper origin (*Ursprung*) runs contrary to the usual transcendental treatment of concepts by Heidegger, for whom the ontological presupposition is the source. A further difficulty of Heidegger's description here of the relationship of these two sciences is his description of philosophy as the 'deadly enemy' (*Todfeind*) of faith. This deep enmity is represented as that between believing (*Gläubigkeit*) and the free self-assertion of the self (here not *Selbstbehauptung* but *Selbstübernahme*). How these enemies can together 'jointly direct' is not made clear.

Insofar as this relationship can be taken as representative of the relation of philosophy to any 'positive' science, the relation of joint direction remains vague. In the introduction to the Kant lectures of 1927/8 Heidegger gives a similar

statement of the relationship of the ontical positive sciences to the ontological science of philosophy. Here he explicitly adopts the Husserlian notion of regional ontologies upon which the expression *formal-anzeigend* depends. In the Husserlian systematic the regional ontologies are complemented by a *formal* ontology. Heidegger clearly has not worked out adequately how his rejection might affect the understanding of the relationship of philosophy to the positive sciences. What would be required for such a clarification would be the completion of his own fundamental ontology which is, of course, not done. Though Heidegger can talk confidently of the problem of thematization in the ontical or positive sciences, he has not been able to work out the problem in the science of philosophy itself, which is the problem of its 'formal' character. Thus the relationship between the two thematics, the two sorts of science, remains unclear. See the lecture 'Phänomenologie und Theologie' published in *Phänomenologie und Theologie* (Frankfurt: Klostermann, 1970). This has been translated by James G. Hart and John C. Maraldo in *The Piety of Thinking* (Bloomington: Indiana University Press, 1976).

See also *Phänomenologische Interpretation von Kants Kritik der reinen Vernunft*, Gesamtausgabe 25, especially 17–39.

54 *Wegmarken*, 94–5. This becomes a very prominent theme in his later thought. See especially the late work entitled *Gelassenheit* (Pfullingen: Neske, 1959) which is translated by John M. Anderson and E. Hans Freund under the title *Discourse on Thinking* (New York: Harper & Row, 1966).

A note added to the lecture on truth (p. 97) tells us that the lecture ('On the essence of truth') was to have been expanded with a second section entitled 'On the truth of essence'. This failed, the note reads, 'for the reasons that are mentioned (*angedeutet*) in the letter "On Humanism"'. The reasons provided there refer to the proposed 'Time and being' section of *Being and Time* and say only that 'thinking failed' and 'did not succeed with the help of the language of metaphysics'. The *Letter* also states that the lecture 'On the essence of truth' provides a certain insight into the thinking of the turning (*Wegmarken*, 159; *Basic Writings*, 208).

55 On behalf of Heidegger's interpretation of Plato, one might object that this overstates the significance of *eros* for Plato, especially for the allegory of the cave in which *eros* is never mentioned and for the *Republic* in general which seems, for the most part, to suppress *eros*. My comment about Heidegger's ignoring *eros* in Plato concerns Heidegger's interpretation of Plato in general and not just his reading of the allegory of the cave, though a good case can be made that *eros* is essential to human nature and its philosophical potentiality, such that the release of the prisoner is called 'natural' (*ei phusei*) (515C). I cannot attempt here an adequate treatment of *eros* in Plato or in the *Republic*. I suggest, however, that *eros* is, for the most part eliminated from the discussion of the *Republic* up until Book V because of the political concern of the discussion. The political and the public require moderation and constraint. The philosopher, however, is by nature at odds with the requirements of the public and political realm. He is private, an *idiotes*, and erotic. Thus in Book V of the *Republic* when the philosopher is introduced, *eros* is introduced into the dialogue. See the description of the nature of the philosopher at 490 A–B. He is the lover of knowledge (*philomathes*) whose love (*eros*) does not cease until he comes into touch with the nature of each thing itself. He consorts with what really is (*toi onto ontos*) and begets *nous* and truth. See also 475E_{ff.} and 485B_{ff.} See the excellent treatments of *eros* in the *Republic* by Arlene Saxonhouse 'The philosopher and the female in the political thought of Plato', *Political Theory*, 4

(1976): 195–212, and by Stanley Rosen, 'The role of *eros* in Plato's *Republic*', *The Review of Metaphysics*, 19 (1965): 462–75. It is the case that the most extensive treatments of *eros* are to be found in the *Symposium* and the *Phaedrus*, but that does not mean that the erotic character of the philosopher is not clearly present throughout the other dialogues. See, for example, *Phaedo* 67B, *Philebus* 58D, *Theatetus* 148Eff., *Timaeus* 42A, *Sophist* 222E, and *Lysis* 218A–B. As much as the value of *eros* for Plato may be mainly pedagogical, so too is philosophy 'pedagogical'.

56 Oskar Becker, an early colleague of Heidegger's at Freiburg, works out the difference between Plato and Heidegger as that between *Dawesen* and *Dasein* in 'Platonische Idee und ontologische Differenz' published in *Dasein und Dawesen: Gesammelte Philosophische Aufsätze* (Pfullingen: Neske, 1963), 157–91. Becker ignores too much the historical task of remembering in Plato. For Heidegger's treatment of the '*gewesende Zukunft*' see *Sein und Zeit*, 326 (*Being and Time*, 374).

57 *Zur Sache des Denkens*, 49; *On Time and Being*, 45–6.

58 I am indebted to Kathleen Wright and George L. Kline, as well as an unnamed reader for this journal, for their careful reading of this paper. I am grateful also to Bryn Mawr College for the support provided by a Junior Faculty Research Leave during which I carried out a part of the research for this paper.

Dasein as *praxis*: the Heideggerian assimilation and the radicalization of the practical philosophy of Aristotle¹

Franco Volpi

1 Introductory considerations: the presence of Aristotle in the work of Heidegger

There has never been any doubt as to the importance of Aristotle for Heidegger's thinking. Even at those moments which were least favourable for a comprehension of the meaning and the constant presence of Aristotle in the work of Heidegger, it would have been difficult to ignore the significance Heidegger accords to certain central themes belonging to the thinking of Aristotle, such as the problem of being or the problem of the *physis*, problems which, in Heidegger's speculations, also become dense thematic points which are continually recovered in the course of his development. Besides, Heidegger himself frequently underlined the importance that Aristotle has assumed in the formation and the development of his philosophical perspective.² And if, in addition, one considers how many important studies on Aristotle have been motivated or inspired by Heidegger,³ one has at one's disposal reasons for supposing that the Heideggerian reading of Aristotle has penetrated much deeper than the published texts would, up to a few years ago, have allowed one to conclude. In any case, even if one limits oneself to the former, it is possible to trace the influence of Aristotle on Heidegger throughout the entire extent of his thinking, reaching from the youthful reading of the dissertation of Franz Brentano *Von der mannigfachen Bedeutung des Seienden nach Aristoteles* right up to the interpretation of being and the concept of *physis* in the essay written in 1939 and published in 1958.⁴

However, hitherto it has not been possible to reconstruct the continuous line of Aristotle's influence across the totality of Heidegger's work. It is only today, thanks to the publication of the university lectures, that one is in a position to get a more exact idea of the intensity of Heidegger's confrontation with Aristotle and to try and reconstruct it in its

essentials. One can also say the same for Heidegger's confrontation with other great founding moments in metaphysical thinking, such as the works of Descartes, Leibniz, Kant, Hegel and Husserl.

In particular, the publication of the lectures for the Winter term 1925/6: *Logik: Die Frage nach der Wahrheit*,⁵ and of that of the Summer term 1927: *Die Grundprobleme der Phänomenologie*,⁶ has contributed documents of the first importance for the reconstruction of, and the confrontation with Aristotle. The same thing holds, one might say, of the lectures given in the Summer term 1931: *Aristoteles, Metaphysik IX, 1-3: Vom Wesen und Wirklichkeit der Kraft*⁷ and of certain parts of the lectures from the Winter term 1929/30: *Die Grundbegriffe der Metaphysik: Welt-Endlichkeit-Einsamkeit*.⁸ Numerous elucidations are also to be found in the publication of the lectures from the Summer term 1924 on *Rhetoric*,⁹ in that of the following term 1924/5 on Plato's *Sophist*¹⁰ (which, in its first part, carries a detailed interpretation of book VI of the *Nicomachean Ethics*) and finally in the lectures from the Summer term 1926: *Grundbegriffe der antiken Philosophie*,¹¹ in which Heidegger handles the history of Greek philosophy from Thales to Aristotle and the final part of which is devoted to an interpretation of the totality of the Aristotelian philosophy. We will also find a number of fundamental indications, with regard to the beginning and to the first decisive development of the Heideggerian interpretation of Aristotle, in the lecture course from his first teaching assignment at Freiburg. Today, we are in a position to confirm this from the first of these lecture courses (which have just been published), that from the Winter term 1921/2: *Phänomenologische Interpretation zu Aristoteles: Einführung in die phänomenologische Forschung*,¹² and in such a way that one can only hope that the other lecture courses from the first Freiburg teaching period, lectures which have not yet been included in the anticipated publication programme (on the grounds that one is not in possession of the original manuscript) might one day be published. By the same token, one has to hope that the celebrated interpretation of Aristotle, which Heidegger sent to Natorp and a résumé of which he even considered publishing in Husserl's *Jahrbuch für Philosophie und phänomenologische Forschung*, will also be published.¹³

2 The confrontation with Aristotle during the ten-year period of silence which precedes *Sein und Zeit*

In what follows, I will try to bring to light a speculative core whose impact upon the confrontation of Heidegger with Aristotle was, in my opinion, considerable at a particular moment, that is, during the ten-year period of silence which precedes the publication of *Sein und Zeit*

and which coincides with the years of the first teaching at Freiburg (from 1919) and with those of the teaching at Marburg. The main reason for this limitation is that, both from the thematic point of view and from that which concerns the intensity of the confrontation, this period is without doubt the most interesting and, at the same time, the least investigated of Heidegger's extended engagement with Aristotle. In fact, I think – something that would have appeared strange only a few years ago – that this phase of Heidegger's thinking can be characterized in a definitive fashion by a radical appropriation and a voracious assimilation of Aristotle's ontology and of practical philosophy and this, more specifically, not only where Heidegger mentions Aristotle and interprets him explicitly but also and more especially, where he doesn't talk about him and seems to concentrate upon the speculative elaboration of the problems which converge later in *Sein und Zeit*. It's for this reason that, in order to grasp the full meaning of the confrontation of Heidegger with Aristotle, one has to take care not to be misled either by a zealous determination to verify the philosophical exactitude and extent of the Heideggerian reading or by too exclusive a concentration upon what Heidegger says about Aristotle explicitly. It is more important to adopt a perspective suitable to grasping and understanding how Heidegger takes up, assimilates, transforms and realizes certain of Aristotle's problems and determinations by rethinking them in relation with the fundamental questions which he confronts within his speculative horizon.

A few preliminary remarks are necessary in order to sketch out, at least in its main lines, the general horizon within which I see the confrontation of Heidegger with Aristotle taking place in this period. In my opinion, this confrontation is characterized (1) by the fact that it is to be situated in the framework of a radical resumption of fundamental themes which the Greeks thought out for the first time in a manner which has become decisive for the history of Western philosophy, themes which, since Hegel and Nietzsche, nobody has been able to take up as radically as Heidegger. (2) It is also characterized by a specific methodological disposition which can be designated, very generally, as a placing in question of the Western metaphysical tradition, a questioning which becomes more and more radical, to the point of ending up with a demand for an overcoming (*Überwindung*, *Verwindung*) of this tradition. In the period under consideration, this calling in question is defined by Heidegger himself as 'destruction', and more precisely as phenomenological destruction (which, together with reduction and construction make up the triple articulation of the phenomenological method).¹⁴ (3) Finally, from a thematic point of view, the confrontation with Aristotle up to *Sein und Zeit* is characterized by the fact that it bears fundamentally upon three main problems which are also the main problems of *Sein und Zeit*, namely the problem of truth, the problem of the ontological

constitution of human life and the problem of time; the general horizon within which Heidegger confronts all these problems is certainly one which is marked by the question of being.

Of these three main problems, I will in particular consider the one which is central for the comparison I propose to make between *Dasein* and *praxis*, namely, the problem of the ontological constitution of, and of the fundamental and unitary modality of being which belongs to, human life. First of all one has to ask how Heidegger comes to identify and to treat this problem within the horizon of that question of being which he begins to raise, as he says himself, as early as his reading of Brentano's dissertation.

3 The problem of the unity of being *qua pollachos legomenon* as the guiding principle of Heidegger's research

There are undoubtedly many elements and speculative suggestions which have played a role in the formation of the Heideggerian problematic and which it would be worth our while to examine in detail. In the framework of an analysis of the relation with Aristotle, allow me to limit my task here to the elucidation of the only function, in the genesis of the three problems indicated, played by the question of being *qua pollachos legomenon*, a question which Heidegger takes notice of mostly by way of Brentano's dissertation.

According to the autobiographical testimony which he himself volunteered in *Mein Weg in die Phänomenologie*, his attention was from the very beginning captured by the problem of the plurivocity of being and, in consequence, by the question of understanding and of determining the fundamental and unitary sense, if there is one, which upholds the plurality of the others. In other words, if Being is to be expressed in multiple and diverse modalities and significations, what is its fundamentally unitary meaning, what does Being itself mean?¹⁵ As is well known, in his dissertation, Brentano examined the four fundamental significations of being (the *pollachos* can consequently be considered as a *tetrachos*) which Aristotle catalogues and examines, especially in the *Metaphysics*, to wit: (1) the meaning of being according to the categorial figures (*to on kata ta schemata ton kategorion*), (2) the meaning of being in as much as it is true (*to on hos alethes*), (3) the meaning of being according to the power or the act (*to on dynamei e energeiai*), (4) the meaning of being in itself or incidentally (*to on kath'hauto kai kata symbebekos*). Faithful to the Aristotelian-Thomist tradition, Brentano did not however limit himself solely to describing the doctrine of the four fundamental significations but also tried to grasp their unitary connection in terms of the analogical unity of being. More precisely, in his attempt at a solution,

he placed especial emphasis upon the fundamental character of the categorical signification and considered substance (*qua* primary category) as the unitary term to which all the other significations were related. So Brentano conceived ontology as ousiology, by interpreting being in a categorical horizon – to the point that he went so far as to attempt a sort of deduction of the categories on the basis of the general concept of being.¹⁶

When, therefore, in *Mein Weg in die Phänomenologie* Heidegger declares that from the time of this reading of Brentano the problem of Being and of its unitary meaning did not cease to bother him,¹⁷ I think we have to take this testimony seriously, not as if it were an idealizing stylization of his philosophical formation aiming to display a constant attention for the question of being, even at the beginning but, on the contrary, as a credible document attesting to the effective genesis, in his youthful reflections, of the problem which was to remain central throughout his entire thinking. If one takes the autobiographical testimony of Heidegger seriously one can even take matters further than he was willing to explicitly acknowledge on this issue and recover the traces of an intensive reflection on the four meanings of being not only in the first writings – especially in the doctoral thesis on Duns Scotus¹⁸ which deals with the categorical signification of being – but also in the later speculation from the 1920s to *Sein und Zeit*, which, on the surface, no longer has anything to do with the problem of being *qua pollachos legomenon*.

The hypothesis which I wish to advance is that the fundamental direction of Heidegger's philosophical research in the course of the 1920s consists in a research into that unitary and fundamental sense which upholds the plurivocity of being. In particular, I want to suggest that, with this end in view, Heidegger at this time probes the four meanings, one after the one, to verify which among them can be considered as the fundamental and unitary meaning. Soon left unsatisfied by the ousiological and analogical solution sustained by Brentano,¹⁹ Heidegger, in the 1920s, concentrates his in-depth examination upon the meaning of being *qua* true. Behind this examination there clearly emerges the intention of determining whether this signification can assume the role of the fundamental meaning. Amongst the texts presently published, the lecture course from the Winter term 1925/6 (*Logik: Die Frage nach der Wahrheit*), but also the conclusive part of that from the Winter term 1929/30 (*Die Grundbegriffe der Metaphysik: Welt-Endlichkeit-Einsamkeit*) and the first part of that of the following term (*Vom Wesen der menschlichen Freiheit: Einleitung in die Philosophie*) attest to the central character of the equation of Being and truth for the Heideggerian comprehension of Being – all of which points out the value of the phenomenological reading of Aristotle. And in my opinion it is also necessary to concede that, with the same aim in view, Heidegger goes on as well to examine the signifi-

cation of being from the standpoint of actuality and potentiality, as is attested by the lecture course from the Summer term 1931 (*Aristoteles, Metaphysik ̸, 1–3: Vom Wesen und Wirklichkeit der Kraft*), again with a view to determining whether it can hold up as the fundamental signification.

In this context I would also like to suggest the hypothesis that, later on, Heidegger sees in the three significations of being assembled by Aristotle a fundamental point of departure, within the metaphysical domain, for recovering, by digging down beneath it, a more originary and primary pre-metaphysical determination of Being. I conclude that it is by questioning the four fundamental significations of being according to Aristotle that Heidegger comes to finalize these characteristics which more and more he will attribute to Being itself in so far as it is thought out of an originary experience. In attempting to go back beyond the determination of the *on hos alethes*, Heidegger comes to attribute to Being the character of *aletheia* and that, by the same token, it is by questioning the determination of the *on dynamei kai energeiai* that he comes to attribute to Being, thought in a more originary manner, the character of *Physis*.

I would now like to show how, on the basis of his prevailing interest in the problematic of the plurivocity of being and the unitary meaning which upholds it, Heidegger arrives at a recuperation of Aristotle's practical philosophy (and principally of the thematic of the 6th book of the *Nichomachean Ethics*), when, in the course of the 1920s, he concentrates upon the signification of being as true.

4 The central character of the signification of being *qua* true and the topology of the loci of the truth

A preliminary remark is called for concerning the phenomenological character of the attitude with which Heidegger prepares the confrontation with Aristotle and carries it through. This character concerns the methodological attitude just as much as the thematic horizon of the confrontation. Moreover, one should not believe that, in announcing the phenomenological inspiration of his reading of Aristotle, Heidegger simply wanted to pay a tribute of gratitude to his master Husserl or, worse still, cover and conceal from him his detachment from phenomenological orthodoxy by using a purely nominal title. In effect, the methodological attitude which in *Sein und Zeit* is characterized by 'destruction' and which, let us say up to the *Kehre*, embodies the spirit in which Heidegger confronts the tradition, undoubtedly owes its origin to a variation and an integration of the phenomenological method theorized by Husserl. Just as for Husserl the philosophical attitude of the reduction

which stands opposed to the natural and naive attitude of common sense places the former between brackets, so with Heidegger, an analogous critique has to be exercised, even when facing the evidence of the history of thinking, that is to say, when faced with the philosophical positions assumed and accepted by the tradition. And just as with Husserl the reduction was connected to phenomenological constitution, so, with Heidegger, destruction is a function of ontological foundation and construction. As Heidegger himself makes known, reduction, destruction and construction constitute the three essential and equally original elements in the phenomenological method.

The conceptual interpretation of being and its structures, that is, the reductive construction of being, necessarily implies a destruction, or, in other words, a critical *de-construction* [*Abbau*] of the received concepts which are at first necessarily operative in order to go back to the source from which they were drawn. . . . The three fundamental elements of the phenomenological method: reduction, construction, destruction are intrinsically dependent upon one another and have to be founded in their mutual belonging together. Philosophical construction is necessarily destruction, that is to say, de-construction, brought about by way of a historical return to the tradition, to what has been transmitted; this does not in any way mean a negation of the tradition nor a condemnation obliterating the latter but, on the contrary, a positive appropriation of this tradition.²⁰

But in what concerns the phenomenological configuration of the thematic horizon within which Heidegger approaches Aristotle and, in particular, his practical philosophy, one has to bear in mind that this approach was adopted in the context of a concentration upon the problematic of being *qua* true and that the circumstance which was certainly determinative in this analysis is that Heidegger arrived at it on the basis of an in-depth study of Husserl's *Logical Investigations* (the traces of which can now be seen in the first part of the lecture course of the Summer term 1925 published under the title *Prolegomena zur Geschichte des Zeitbegriffs*).²¹ In the course of reflecting upon the comprehension of the truth proposed by Husserl, Heidegger systematically develops a conviction which had already taken root in Husserl's work, to wit, the conviction that judgment, assertion, understood as a synthesis or dihairesis of representations, does not constitute the original locus of the manifestation of truth but a dimension which has undergone a restriction with regard to the ontological depth and the originary extent of the phenomenon. Developing this conviction in a systematic way, Heidegger finishes up questioning three traditional theses on the truth, to wit: (1) the thesis that the truth consists in an *adequatio intellectus et rei*, (2) the

thesis that the originary locus of its manifestation is the judgment, in as much as it is the connection or division of representations and of concepts, (3) the thesis that the authorship of these two theorems has to be attributed to Aristotle.²²

In fact, with his thesis that not only acts of synthesis but also monothetic acts of simple apprehension can have a truth-character, Husserl had already called in question the traditional theory of truth as adequation. With this end in view he had also introduced a decisive distinction, namely the distinction between the truth of the proposition or of the judgment (*Satzwahrheit*) and the truth of intuition (*Anschauungswahrheit*), the latter is considered the more originary truth and therefore represents the foundation of the former. In addition, Husserl had introduced a fundamental innovation, recognized by Heidegger, which consists in the distinction and the theorization of categorial intuition. Conceived on the analogy of sensible intuition, it enabled Husserl to explain that modality of the apprehension of the elements of judgment whose identification (*Ausweisung*) goes beyond the sensible intuition, elements which, in the traditional theory of truth, had been understood as belonging to the domain of the categorial.²³

Deepening the direction in which these Husserlian theses proceeded, Heidegger theorizes a fundamental distinction between the purely logico-categorial meaning of being-true (*Wahrsein*), which belongs to the proposition, and the ontological meaning of truth (*Wahrheit*), which belongs to the phenomenon of truth in its originary scope. In Heidegger's eyes, it is precisely this originary ontological depth of the phenomenon of truth which Aristotle takes account of as the decisive dimension, even if, clearly, he also recognizes the restricted signification of that being-true which is referred to the proposition. In consequence, Heidegger seeks to restore to those Aristotelian texts which bear upon the truth their originary scope, by freeing them from the fixed prejudices of a certain interpretative tradition which had prevailed hitherto and which can, according to Heidegger, even be found in a reading of Aristotle like that of Jaeger, which is innovative in other respects. Thus, the Heideggerian calling-in-question of the traditional theory of truth, initiated by the Husserlian phenomenological approach, goes along with a highly ontological reading of certain basic texts of Aristotle, such as *De interpretatione* I, *Metaphysics* IX, 10, *Nichomachean Ethics* VI.

Heidegger proceeds toward an uncovering of the more profound ontological meaning of the phenomenon of truth by way of a kind of triple argumentative progression:

(1) First of all, he distinguishes the semantic aspect of the *logos*, that is to say, the property of having a signification, an aspect which belongs to every form of the *logos*, and the apophantic character which is not

present in every form but only in that form *par excellence* of the *logos* which is the *apophansis*, predication or assertion. The specificity of this particular form of the *logos* consists in the fact that it is a synthesis or a dihairesis of concepts and in the fact that, as such, it possesses the character of being-true or being-false, more precisely, of being-able-to-be-true or being-able-to-be-false.

(2) Then Heidegger inquires into the ontological foundation of predicative discourse, of the *logos apophantikos*, with a view to identifying the ontological condition of the possibility of its being-true or being-false. And he finds it in the ontological constitution of human life i'tself, in *Dasein*, which contains in itself the intrinsic possibility of assuming; even better, of being itself an uncovering attitude, that is to say, of opening, and of opening itself in relation to, being.

(3) Finally, deepening his calling-in-question, Heidegger inquires into the ultimate ontological foundation of the uncovering of being by *Dasein*. And he arrives at the conclusion that this foundation is to be sought in the fact that being itself has the ontological constitution of something which gives itself, which is accessible to and perhaps grasped by the particular being which bears within itself the uncovering attitude, that is to say, *Dasein*. With reference to the latter, being is potentially *manifestativum sui*. It is evident, manifest, disclosed, *un-verborgen*, *a-lethes*. The truth conceived as *a-letheia*, as *Un-verborgenheit*, is therefore an ontologically constitutive character of being itself. It is an ante-predicative determination with reference to which the being-true or being-false of predication is a derived and restricted property.²⁴

Following this argumentative progression, Heidegger arrives at a sort of topology or hierarchy of the loci of truth which he develops by assimilating certain Aristotelian theses in a radicalizing elaboration. In a somewhat expeditious but adequately synoptic fashion one can sum up the framework of this topology of truth as follows:

(1) The true is above all being itself in as much as it possesses the character of being manifest, disclosed. With this thesis Heidegger revives the ontological potency of the Aristotelian understanding of the truth which can be expressed in the equation: *on hos alethes*.

(2) The true is secondly *Dasein* itself, human life, in the sense that it is uncovering and that it develops this characteristic in its fundamentally uncovering attitudes. Behind this thesis it is not difficult to see the recovery of an Aristotelian idea, to wit, the idea of the Aristotelian determination of the human soul (psyche) as being-in-the-truth (*aletheuein*). In Aristotle, in fact, and especially in Book VI of the *Nichomachean Ethics*, Heidegger sees an analysis of the different ways in which the soul uncovers being, is in the truth, an analysis which has not yet been obscured by modern theoretical prejudices. And he therefore sees in

this analysis the first complete phenomenology of the fundamentally uncovering attitudes of human life, of *Dasein*.

(2.1) First of all, there is the specific modality of uncovering proper to the human soul and which distinguishes it both from the Gods and from the other animals: it is made manifest by way of the *logos*, which institutes the links and precisely under the five modes of being-in-the-truth proper to the soul: *episteme*, *techne*, *phronesis*, *nous*, *sophia*;²⁵

(2.2) but this modality of uncovering, determined by the *logos*, is founded in a direct and immediate manner of acceding to being and of uncovering it, which latter takes place either in the *aisthesis*, about which Aristotle says that it is always true (*aei alethes*),²⁶ or in the noesis, which apprehends its object through a direct contact by, so to speak, touching it and which, for this reason, and because it neither effects a synthesis nor a diaresis, cannot be false but can simply not take place (in the *agnoein*).²⁷

(3) The true is finally the form *par excellence* of the *logos*, to wit, the *logos apophantikos* or *apophansis*, that is to say, predication or assertion in its affirmative (*kataphasis*) or its negative (*apophasis*) form. And this holds either in the sense that the *logos* is an *aletheuin qua legein*, or in the sense that the *logos* is *alethes qua legomenon*.²⁸

It will now be necessary to undertake a deeper examination of the way in which Heidegger, having detached the comprehension of the phenomenon of truth from this latter dimension, that is, from the derivative and restrictive structure of predication, finishes up by radicalizing his inquiry into the traditional metaphysical conception of the truth. If, indeed, and thanks to his appropriation of Aristotle, Heidegger gains an ontological outlook which permits him to take the problem up again in a radical manner, there still remains open the question of the non-explicit presuppositions upon which even the Aristotelian conception of the phenomenon of truth is founded, and founded as a character of being *qua* manifest. The question Heidegger poses is the following:

What does Being have to mean if being-uncovering is to become comprehensible as a character of Being and even as the most authentic of all? If, in consequence, beings have in the end to be interpreted relative to their Being on the basis of being-uncovered?²⁹

Even at this time, towards the middle of the 1920s, the vision of the problem which characterizes and will characterize Heidegger's thinking more and more is being clearly formed. Here already Heidegger thinks it possible to claim that the unquestioned foundation of the Aristotelian equation of Being and truth consists in the presupposition of a well-defined relation between Being and time and therefore in the

presupposition of a certain comprehension of Being and of time themselves. Why? Because, in order that the truth, in the sense of being-uncovering, of being-disclosed (*a-letheia*), can be characterized as an ontological characteristic of entities, the being of entities must first be implicitly understood as presence (*Anwesen*), for only what has previously been understood as present can later be determined as discovered, as disclosed, that is to say, as true (*a-lethes*) in the sense suggested by the Heideggerian etymology of the Greek word. But the interpretation of Being as presence has its implicit foundation in the presupposition of an unquestioned connection of Being with time, in the context of which the dimension of the present is taken to be the determinative dimension of time. In other words, with regard to an understanding of time which privileges the dimension of the present, there corresponds an interpretation of Being in which the primacy is consequently accorded to presence.

In this way Heidegger clears and, at the same time, prepares the ground for his interpretation of the history of metaphysics. Indeed, he arrives at the conviction – confirmed a little later by the celebrated interpretation of the Platonic myth of the cave – that metaphysical thinking is structured and takes form as the thinking of presence, that is to say, as a thinking which does not pose, in a sufficiently radical fashion, the question of the relation between Being and time in all its articulations. Heidegger arrives at this conclusion by way of his interpretation of the problem of truth in Aristotle from the time of the lecture course of the Winter term 1925/6. In a passage from this course which is very significant in this regard, he says:

The pure being-uncovering of beings, as Aristotle conceives it with reference to the simple, this pure being-uncovering signifies nothing other than the pure present, non-displaced and immovable, of what is present. Being-uncovering [*Entdecktheit*], that is to say in this case the pure present is, as present [*Gegenwart*], the supreme mode of presence [*Anwesenheit*]. But presence is the fundamental determination of Being. So, being-uncovering, as the supreme mode of presence, that is as present, is a mode of being and precisely the most authentic mode of being of all, presence itself which is present. . . . That is to say: since Being is understood as presence and being-uncovering as present, and since presence [*Anwesenheit*] and the present [*Gegenwart*] are present, Being as presence can and even must be determined by the truth as present, and in such a way that the present is the supreme mode of presence. Plato already designated Being as present. And the term *ousia* which, in the history of philosophy, is peddled in a completely senseless fashion as substance, means nothing other than presence in a well-determined sense. One has to

emphasize that the Greeks, Plato and Aristotle, did in fact determine Being as presence. But they were very far from understanding what that really means when they determined Being as presence and as present. . . . Once one has understood this problematic of the intimate connection of the understanding of Being on the basis of time, one is then certainly in possession of a clue with which to return to an elucidation of the history of the problem of Being and of the history of philosophy in general.³⁰

Following which, Heidegger, from this moment on, tries to get back either beyond the ultimate presupposition on which the ontological understanding of the phenomenon of the truth is based or beyond the unquestioned presuppositions of Western thought which, from Plato to Husserl, take on for him the form of a metaphysics of presence.

If however the progressive radicalization of the calling-in-question of the comprehension of truth certainly already indicates the final direction in which Heidegger will deepen his confrontation with metaphysics, and if it exhibits several aspects which make it interesting and which provide a motive for further examination, nevertheless it seems to me that it is still not carried through in the spirit and with the intentions which will later characterize his proposal with regard to the overcoming of metaphysics. Or better: if Heidegger already envisages here the possibility and the necessity of calling-in-question the fixed philosophical themes of the tradition, this calling-in-question still does not aspire to overcome, and so to abandon, metaphysical thinking with a view to moving off in another direction. Rather, it is a matter of a calling-in-question which proceeds from the conviction that metaphysics is not built on a sufficiently radical basis and which does not therefore envisage an overcoming of metaphysics in the sense of *Überwindung* or of *Verwindung* but rather of a foundation which is more truly original. In fact, at this time Heidegger still thinks that it is possible to achieve a radical foundation for ontology by way of a Dasein's analytic and, in consequence, right up to the Kant book of 1929, he calls his programme 'fundamental ontology' or 'metaphysics of Dasein', thereby attributing to the terms 'ontology' and 'metaphysics' a meaning which is entirely positive. It is precisely with a view to a radically founded construction that Heidegger assumes the methodological attitude of the 'destruction', an attitude which allows him to clear the way.

In what concerns the foundational attitude of this programme, I don't think it is an accident if, up to the *Kehre*, Heidegger pays special attention to Aristotle, Descartes, Leibniz, Kant, Husserl; and if, after the *Kehre*, on the contrary, with the progressive radicalization of his critique and with the circumventing of metaphysics, he abandons any foundational intention. And it is also significant that this progressive radicalization

ripens within a horizon which is marked by the confrontation with Nietzsche, that is to say, with the densest and most advanced point in the corrosive critique of Western philosophy, a horizon which is marked at the same time by an assiduous restitution of pre-Socratic thinking, that is to say, a thinking which precedes the metaphysical decision of the West, a horizon which is marked finally by an affinity for, and a proximity to, the twilight theophany of Hölderlin which, with reference to the destiny of metaphysics, represents the alternative, and the possibility of the new God to come.

5 The uncovering structure of Dasein and the focalization of the horizon of *praxis*

To return to the question of the role of the problematic of the plurivocity of being and, in particular, of the signification of being as true, one might say that it is while analysing this last signification in the horizon of the founding intentions mentioned above that, in the course of the 1920s, Heidegger comes to place at the centre of his speculative efforts the problem of the apprehension and determination of the fundamental ontological structure of human life, of the psyche, of Dasein, more exactly, of the latter in its specific character as being-uncovering, in its being an *aletheuein*. So it is within the typically phenomenological horizon of the problem of the constitutive structure of the 'subject' that Heidegger interprets the Aristotelian determination of the psyche as *aletheuein*, and it is by way of this juncture of a phenomenological approach with Aristotelian elements that he paves the way for his analysis of existence.

But why is *praxis* central, and where does it get this characteristic? From what is the importance of the *Nichomachean Ethics* (an importance announced in my title) derived? There are many indications which, in my opinion, speak in favour of the hypothesis that Heidegger arrived at an Aristotelian determination of *praxis* while trying to solve the problems that Husserlian phenomenology had raised but which, in his view, the Husserlian understanding of subjectivity had left open rather than resolved.

In Heidegger's view, Husserlian phenomenology got stuck in a fundamental aporie, to wit, the aporie of the belonging of the subject to the world and of the simultaneous constitution of the world by the subject. Heidegger did not find satisfying the solution proposed by Husserl, a solution which consisted in distinguishing the psychological subject which participates in the world and the transcendental subject which constitutes the world, and which distinguishes the reality of the former from the ideality of the latter. Certainly, Heidegger shares with Husserl the conviction that the constitution of the experience of the world cannot be

explained by retreating to a being which has the same modality of being, the same ontological constitution as the world. Heidegger, however, distances himself from Husserl because the Husserlian determination of transcendental subjectivity seems to him to have been won, predominantly and unilaterally, on the basis of a theoretical consideration of the acts of the life of consciousness.³¹

Why this impression? Because, by way of his analysis of the phenomenon of truth and by way of the topology of the loci of its manifestation, Heidegger comes to be convinced that *theoria* is only one of the different possibilities and modalities of the uncovering attitude through which man accedes to being. Alongside *theoria* and before *theoria* there is, for example, the uncovering attitude of *poiesis* or that of *praxis* by means of which too man is related to being and apprehends it. Heidegger takes his bearings from Aristotle precisely because Aristotle still retains the plurality of the uncovering attitudes of human life and, in the 6th book of the *Nichomachean Ethics*, offers the first systematic analysis differentiating the three fundamental uncovering attitudes of the soul, to wit, *theoria*, *poiesis* and *praxis*, together with the specific forms of knowledge which go along with them, namely, *sophia*, *techné* and *phronesis*.

In consequence, I think that one's chances of coming to terms with the speculative labour of Heidegger during the 1920s are improved if one rereads the analysis of *Dasein*, developed in the fundamental ontology, in the light of the phenomenological reading of Aristotle, in particular, the *Nichomachean Ethics*, and if one pays attention to the fact that the results of this voracious assimilation of Aristotle are often deposited in passages and in argumentative connections where Heidegger does not speak about Aristotle explicitly.

6 Aristotle's practical philosophy as the background to the analysis of existence: correspondences, transformations, differences

It is precisely the Aristotelian horizon of certain fundamental determinations developed by Heidegger in his analysis of existence which I want to bring out by identifying the correspondences by means of which one can see how Heidegger takes up again and reformulates the substantive meaning of equivalent concepts from the practical philosophy of Aristotle in a few fundamental terms of his own analysis.

The first correspondence, a correspondence which is so obvious that it stands in no need of a special proof, is the correspondence between the three fundamental modalities of being, namely, *Dasein*, *Zuhandenheit* and *Vorhandenheit*, modalities distinguished and determined in the lectures from the 1920s, as also in *Sein und Zeit*, and the three Aristotelian determinations of *praxis*, *poiesis* and *theoria*. (1) *Theoria* is the uncover-

ing attitude which has both a descriptive and a veritative character, for it is directed toward the simple affirmation of the way in which things behave, the apprehension of the truth of beings; the knowledge which belongs to it is *sophia*. According to Heidegger, when human life assumes this uncovering attitude, being presents itself in a modality he calls *Vorhandenheit*.³² (2) *Poiesis* is the productive, manipulative, uncovering attitude, in which one finds oneself when one handles entities and this attitude aims at the production of works. *Techne* is that kind of knowledge which guides the latter towards its objective. When one assumes this attitude, beings present themselves to us in that modality of being which Heidegger calls *Zuhandenheit*. (3) *Praxis* is the uncovering attitude which is realized in this form of action, whose goal is contained in itself (*hou heneka*), that is to say, in its success as action and not in something external to it (*heneka tinos*). *Phronesis*, or prudence, is the kind of knowledge which belongs to the latter and which gives it its orientation. My hypothesis is that the uncovering attitude of *praxis* is the attitude on which Heidegger bases his analyses, with a view to attaining the fundamental thematic determinations with which he designates the ontological structure of human existence, of *Dasein*.

This last correspondence, which certainly appears as the most problematic and the most disputable, but which, in my view, is for all that the most significant and the most central, has to be developed in greater detail. But first, it would be suitable to make a brief remark about the nature of the Heideggerian recovery of the fundamental meaning of the three determinations of *praxis*, *poiesis* and *theoria*. It is obvious in fact that Heidegger does not commit himself to a simple recovery of these determinations but that, in taking them up, he profoundly modifies the structure, the character and the connection of these determinations. The most perceptive transformation seems to me to be the accentuation, better the absolutization, of the ontological character which, to a certain extent, they also possess with Aristotle, but which, with him, is not the only character, not even always the determinative character. Let me explain: Heidegger explains the Aristotelian determinations of *praxis*, *poiesis* and *theoria* as if they were only modalities of being, thereby rigorously excluding any understanding of their ontic significance. Clearly, what interests Heidegger, from the standpoint of a determination of the fundamental ontological structure of *Dasein*, are not particular *praxeis*, *poieseis* and *theoriai* but only the ontological power of these concepts. To be sure, in Aristotle's text he finds indications which can sustain his highly ontological reading: if, for example, one considers the distinction between *praxis* and *poiesis* brought to light in the *Nichomachean Ethics* VI, in connection with *Metaphysics* IX, 6, one can see quite clearly that even with Aristotle it is not a question of a purely ontic distinction, that is to say, that it does not refer exclusively to particular

actions amongst which certain would be *praxeis* and others *poieseis*. It is a distinction which also has a philosophical and ontological meaning to the extent that it points out a modality of being. With the result that it is capable of referring to the same ontic class of actions while introducing an ontological distinction: making a speech, for example, can be either a *poiesis*, a production of *logoi*, or a *praxis*, the exercise of an activity which is its own goal; the distinctive character of this activity, its distinctive modality of being, which arises out of the intention and out of the goal with regard to which it is executed, does not become apparent at the ontic level but only upon the ontological plane. It is the ontological quintessence of the Aristotelian concepts of *praxis*, of *poiesis* and of *theoria* that Heidegger underlines in his interpretation and which he extracts and absolutizes through his recuperation of these concepts in the determinations of Dasein, of *Zuhandenheit* and of *Vorhandenheit*.

One other determinative transformation is the change of order in the hierarchy of the three attitudes. It is not *theoria* which is considered to be the supreme attitude, as the highest and preferred activity for man. Rather, in the ontological context established by Heidegger, it is the attitude of *praxis*, linked to a whole series of other determinations implied by it, which becomes the central connotation, to the extent that it is conceived as the fundamental modality of being and as the ontological structure of Dasein. Together with this reversal, there goes a change in the relation with the other determinations: *Zuhandenheit* (which recovers the determination of *theoria*) and *Vorhandenheit* (which corresponds to the determination of *theoria*) are connected and tied to Dasein (for which, ontologically speaking, *praxis* is the modality of being). They indicate, respectively, the ways of being in which, correlatively, beings are bound up depending on whether Dasein, the 'originary *praxis*', is articulated together with beings in the constative and observational attitude or in the manipulative and productive. *Poiesis* and *theoria*, together, are both modalities of the unitary attitude of Dasein which Heidegger names *Besorgen*. In this way, by tracing *poiesis* and *theoria* back to a deeper common dimension, Heidegger obtains two further results: he shows the connection between *Zuhandenheit* and *Vorhandenheit*, between *poiesis* and *theoria* and between the latter and Dasein, the originary *praxis*. In addition, and against the traditional conception, he succeeds in showing that *theoria* is not an originary attitude but that it is derived from a modification of the poietic attitude (in consequence, as is well known, from the phenomena of *Auffälligkeit*, of *Aufdringlichkeit* and *Aufsässigkeit*³³).

Ontological interpretation, hierarchic displacement and unitary structuration are the determinative transformations to which Heidegger subjects the Aristotelian concepts of *praxis*, *poiesis* and *theoria* in the recovery of their substantive meaning. But what is the rationale for

these transformations? In view of the impossibility of offering a detailed analysis, I will limit myself here to what seems to me to be the basic reason. This consists, in my opinion, in the fact that Heidegger moves progressively towards the conviction that the Aristotelian determinations in question, as they are presented in the *Nichomachean Ethics*, are in fact indicative of the three fundamental uncovering attitudes of human life, the three forms in which the soul is in the truth, and that they therefore constitute the first completely phenomenological analysis of Dasein, but that Aristotle does not succeed in posing explicitly, and in a sufficiently radical manner, the problem of the unity which lies at the bottom of these three determinations and which sustains them. In other words, Aristotle did not succeed in grasping the fundamental ontological constitution of human life. According to Heidegger, as is well known, this omission is due to the fact that, by remaining within the horizon of a metaphysics of presence, Aristotle remains tied to a naturalistic understanding of time which prevents him from seeing that the unitary structure of human life is originary temporality.

7 Dasein as the 'ontologizing' of *praxis*: the practical origin of the determinations of existence (*Zu-sein*, *Sorge*, *Jemeinigkeit*, *Worumwillen*, *Befindlichkeit* and *Verstehen*, *Gewissen*, *Entschlossenheit*) and the consequences

But why then, and in spite of this critique, does one have to insist on the fact that the understanding of the modality of the being of Dasein is drawn from an ontologized concept of *praxis*? Because it seems to me that several indications speak in favour of this thesis, which tells us in an undeniable fashion that the characterization of Dasein and the determination of its fundamental structures are accomplished within an eminently 'practical' horizon (in the Aristotelian sense of *praxis*). By interpreting the structures of Dasein across the filigree of the Aristotelian understanding of *praxis* and of its sustaining categories, I will then try to bring to light the structural, conceptual and even sometimes terminological correspondences between Heidegger's and Aristotle's vision of the problem, without thereby ignoring or denying the differences. In as much as the points taken into consideration previously prepare the way, the legitimacy of this reconciliation of determinations which, on the surface, are so divergent will appear self-evident, both in and of itself, and in the context of the concepts and terms which this reconciliation makes possible. Besides, one can count upon the confirmation deriving from the fact that Heidegger himself, in his interpretations of Aristotle, and notably of the *Nichomachean Ethics* from the 1920s, explicitly under-

stands the *episteme praktike* as an ontology of human life, of Dasein, and also suggests the equation of Dasein and *praxis*.³⁴

7.1 *Having-to-be (Zu-sein) as a practical determination*

To begin with, in my opinion, one has to read the characterization of Dasein as having-to-be (*Zu-sein*) in an eminently practical sense. Having-to-be is introduced by Heidegger in paragraphs 4 to 9 of *Sein und Zeit*. With this characterization, indicative of the modality in which Dasein is and relates itself to its being, Heidegger wants to stress that this relation of Dasein to its being is not carried through in an attitude of observation and assertion, in a sort of turning back upon itself, in a theoretical and reflective introspection, but rather in a typically practico-moral attitude in which what is at stake is the very being of Dasein and in which one has to come to a decision about this being and uphold, whether one wants to or not, the weight of this decision. In other words, Heidegger wants to point out that Dasein does not in the first instance stand in relation to its being with a view to asserting and describing its significance and essence, to saying, for example, that it is *animal rationale*, but to decide what to do with this being, to choose, amongst different possibilities, the one which he will assume as his own and realize.³⁵

To be sure, one cannot ignore the fact that Heidegger only retains the practical connotation of the ontological structure of Dasein as having-to-be as long as he pursues the project of apprehending and of determining the structure of Dasein in its specificity on the basis of Dasein itself in its purity. One knows that, later, when Dasein is no longer understood in itself but out of the horizon in which it is always already constituted, Heidegger will systematically eliminate all trace of this practical connotation and will determine the 'open' character of existence no longer as having-to-be, but as *ek-sistence* in the opening of being.³⁶ But precisely the very insistence with which Heidegger retracts the practical characterization of Dasein leads one to believe that it is the right way to recuperate the first Heideggerian understanding of the ontological modality of existence.

7.2 *Care (Sorge) as the root of the practical structure of Dasein*

It is only on the basis of the practical comprehension of the auto-referential structure of Dasein that it becomes possible to grasp, in its structural unity, the other existential connotations that Heidegger proposes. It becomes understandable, for example, why Heidegger designates the fundamental modality of *Erschlossenheit*, the open character of Dasein and the unity of the existential determinations by means of a concept which, from the thematic point of view, comes from practical philosophy, namely, the concept of care (*Sorge*). The determination of *Sorge* through which Heidegger takes up again and points out the

phenomenon which Husserl designated as intentionality is, in my opinion, drawn from an ontological interpretation of the character of human life, designated by Aristotle through the term *orexis*. The proof? It is enough to collate the passage from Aristotle's text in which the term *orexis*, or the corresponding verb *oregomai*, appears and to see how Heidegger translates them. One discovers that he always makes use of his term *Sorge*. The most notable passage comes from the beginning of the *Metaphysics* where the initial proposition '*pantes anthropoi tou eidenai oregontai physei*' is translated by Heidegger as 'Im Sein des Menschen liegt wesentlich die Sorge des Sehens', whereby it is important to stress not only the correspondence between *oregontai* and *Sorge* but also the ontological interpretation of *pantes anthropoi* by 'Im Sein des Menschen'.³⁷

Within the same practical horizon one also comes to understand better why Heidegger designates as *Besorgen* (at the root of which lies the productive-manipulative disposition of *poiesis* rather than the constative-descriptive disposition of *theoria*) the modality within which *Dasein* lays itself open to and relates itself to things, and as *Fürsorge* the modality of being through which *Dasein* is in relation with others. One understands better because these determinations have their common unitary root precisely in the practical character of *Sorge*, and that indicates, again, that the entire structure of *Dasein* is practical in nature.

It isn't necessary to recall here how Heidegger directs his analysis toward an investigation of the unitary foundation which sustains the auto-referential practical structure of *Dasein*, indicated by *Zu-sein*. As is well known, Heidegger finds this foundation in the idea, thematized and conceptualized by him, according to which *Dasein* is not something that is realized and fulfilled in the momentary actuality of a pure activity but is structurally a *capacity* (*Seinkönnen*) which surpasses and reaches beyond the confines of presence in order to be exposed to the temporal ecstasis of the future, in which the projection of its possibilities is unfolded, and the past, which is always the horizon and the inevitable context for projection. So, for Heidegger, *capacity* is a modality of being characterized by a fundamental ontological and temporal suspension proper to *Dasein* in as much as the latter is originally open and free-for; and since this liberty is not something that *Dasein* chooses but which belongs to its very ontological constitution, it follows that *Dasein* perceives it as something which it cannot get rid of, as a weight, the weight of the unbearable lightness of its being which makes itself known in the *Grundstimmung* of anxiety.

Heidegger draws certain fundamental conclusions from the ontological interpretation of the practical structure of *Dasein*.

(1) Against the metaphysical priority of the present and of presence, he upholds the primacy of the future. Precisely because *Dasein* is related

to its being in a relation of a practical kind, when deciding about its being the being which represents what is at stake in this decision is always a future being, for – as Aristotle frequently underlines – deliberation (*bouleusis*) and decision (*prohairesis*)³⁸ bear upon the future.

(2) The being toward which Dasein stands in relation in the practical auto-reference is always the very being of Dasein itself, and it's for this reason that Heidegger attributes to it the character of *Jemeinigkeit*, being in every instance mine. I surmise that with this determination Heidegger is rethinking, and giving an ontological interpretation of the meaning of, a characteristic which belongs to the knowing of *phronesis* and which Aristotle formulates when he says that *phronesis* is a *hautoi eidenai*.³⁹

(3) In view of all these elements Heidegger upholds a radical distinction between the ontological constitution of Dasein and that of beings different from Dasein, by basing it on the consideration that Dasein is the only being ontologically constituted as a *Zu-sein*. Upon this distinction Heidegger also founds the ontic and ontological priority of Dasein, and he criticizes the inadequate radicality of the metaphysical differentiation of man and nature, subject and object, consciousness and world, precisely because they are not rooted in a true apprehension of the fundamentally unitary structure of human life.

(4) The practical determination of the being of Dasein finally implies the rejection of the traditional theory of self-consciousness, conceived as a knowledge of self of a reflexive and informative kind and obtained by way of an *inspectio sui*, by way of a sort of turning back of consciousness, or of the subject, upon itself. The identity of Dasein is constituted practically to the extent that the latter refers, according to its own nature, to its *Zu-sein*, by assuming the latter or by not assuming it. In addition, this self-reference is not developed exclusively by means of transparent acts of the understanding but also depends upon 'inferior acts', on moods, on the sensible and passive components of human life. In this way Heidegger puts a double distance between himself and the metaphysical tradition where the specificity of the being of human life is re-duced and restrained within the objectifying categories of pure observation and within a theoretical horizon dominated by doctrines of presence and of consciousness.

The practical structure which designates and determines the ontological constitution of Dasein is the result – and this is still my contention – of a kind of speculative sedimentation (in Heidegger's thinking and even in the terminology of this period) of the essential meaning of the determinations of being and of the moral life of man presented by Aristotle in the *Nichomachean Ethics*. We are talking here of a sedimentation produced in the form of an ontological interpretation and whose intention is to validate and to realize the ideas which it takes up again. To be

sure, by linking the Heideggerian analysis of existence so closely to Aristotle, doubts inevitably arise, doubts which can moreover be based, at least apparently, on Heidegger's own text. In fact, in his presentation of the programme of an existential analytic, Heidegger quite explicitly distances himself from Aristotle: he criticizes, for example, the Aristotelian thesis in accordance with which the primacy of man is founded on the fact that the soul, in as much as it knows, is a kind of reflection of all beings, or this other thesis according to which the essence of man consists in his *anima rationalis*. Nevertheless, one should note that Heidegger did not fail to acknowledge, on several occasions, his indebtedness *vis-à-vis* Aristotle. This even happens in the course of his existential analyses where, ordinarily, Heidegger covers up and effaces the traces of his productive assimilation.⁴⁰ Let us therefore consider which are the relevant determinations of Aristotle's practical philosophy taken up in Heidegger's existential analysis. To do this, and so to verify our thesis, it will be necessary to reread the critical passages from the existential analysis in a spirit which I would call a deciphering rather than interpreting, a spirit which is however well supported by the Marburg texts and which, in addition, finds ample support in *Sein und Zeit*.

What is taken up first of all is the general framework of the problem which engages Aristotle's attention. In fact, one can say that in the horizon established by the consideration of *episteme pratike* – a term, I want to emphasize, translated by Heidegger as *Ontologie des menschlichen Lebens* – Aristotle considers human life in totality as a *praxis* and not as a *poiesis*;⁴¹ and *praxis* is considered as the specific *kinesis* of human life, which is not simply oriented toward the conservation of life itself, towards living pure and simple (*zen*), but which is *bios*, the project of life which, once vital conservation is assured, comes to terms with itself in the space which opens up before it in relation to the problem of how to live, that is, to the choice of the preferable form of life for man, to the problem of living well (*eu zen*) and to the means suited to realizing this goal. This means that man, *qua* political animal endowed with *logos*, carries the weight of the responsibility of deliberating (*bouleusis*), of choosing and of deciding (*prohairesis*) about the modalities and the forms of his life by turning toward that which he takes to be the best. As we know, it is the wise man, the prudent man (*phronimos*), who succeeds in deliberating well, in choosing and deciding well and who realizes right action (*eu pratein*), the good life (*eu zen*) and therefore happiness (*eudaimonia*).

This fundamental intuition of Aristotle's is taken up again in my sense by Heidegger and reformulated by means of a transformation which ontologizes and radicalizes it while accentuating its substantial significance. In fact, for Heidegger *Dasein* too is that particular being whose being is always in question and this most especially in that eminently

practical sense in which *Dasein* has to decide about the forms and modalities of its own self-realization, even in those limiting cases where this decision is a matter of not deciding or abstaining from making a decision. As Aristotle would have it, *Dasein* is the being who must decide, *ta hautoi agatha kai sympheronta*.⁴² And just as with Aristotle, one's success in life is determined by following the *phronesis*, with Heidegger too it's only when *Dasein* is attentive to the call of conscience and recognizes this 'having to decide' as its task and as its very being, that is, when it recognizes itself in its practical character by assuming the latter in the projection of its own possibilities, in the realization of its *praxis*, it is only then when *Dasein* takes responsibility for its being that it realizes itself as authentic (*phronimos*).

It is also possible to maintain that, in the 1920s, Heidegger is concerned to identify and determine the *Grundbewegtheit*, the fundamental characteristic of mobility proper to the being of human life in the practical self-reference by which it is determined. In the Aristotelian thesis in accordance with which *praxis* is *kinesis tou biou*, the movement specific to human life,⁴³ Heidegger sees decisive support for, and substantial confirmation of, the direction of his research, which leads him to distance himself from Husserl in order to come nearer to Aristotle and, at the same time, to filter his reading of Aristotle through the problems which he inherited from Husserl. In this way a highly productive interaction ensues between the demand for a speculative enrichment, which makes use of Aristotle, and a reading of Aristotle which is fertilized by a speculative orientation which determines in advance the problems to be tackled.

It is not possible to offer here an analysis of Aristotle's understanding of *praxis* and it is still not possible to pursue in detail the interpretation offered by Heidegger of Book VI of the *Nichomachean Ethics* due to the absence of certain texts like the Winter 1924/5 lectures on Plato's *Sophist*, the introductory part of which contains a detailed reading of Book VI, or the Summer 1926 lectures, the last part of which is entirely devoted to a general interpretation of Aristotle's ontology, including what Heidegger calls the ontology of human life, that is, the *episteme praktike*. But the evidence in our possession does nevertheless suffice, in my opinion, to indicate at least the basic direction of Heidegger's thinking.

In what concerns the central concept of *praxis*, Heidegger thinks he detects in Aristotle, as we have seen, a dual employment of the concept: an ontic employment in which the term indicates particular *praxeis* and in accordance with which these *praxeis* are certainly distinguished but at the same level as the *poieseis* and the particular *theoriai*: this is how it is used for example at the beginning of the *Nichomachean Ethics*; and a philosophical and ontological use in which *praxis* does not indicate

particular actions but a modality of being. In this latter sense, *praxis* is the concept employed to determine the modality of being proper to human life, its specific *kinesis*. It is this use of the term one finds, for example, in *Nichomachean Ethics* VI, 5, or in *Metaphysics* IX, 6. The fundamental structure of this *kinesis* is *orexis* in its two consecutive moments of *dioxis* and *phyge*, and what characterizes human life more exactly is an *orexis* closely bound to *nous praktikos* and susceptible of being oriented by the *dianoeisthai* of the *logos*, in the case of *phronimos*, by an *orthos logos*. *Praxis* arises out of the juncture of these two moments, *orexis* and *nous*, by way of the process of deliberation (*bouleusis*) which ends up in choice and in the decision to act (*prohairesis*). If the *orexis* is right and the *logos* true, there results not only good deliberation (*euboulia*) but also the success of the *praxis*, *eupraxia*.

Reflecting in depth upon the Aristotelian structure of *praxis* and upon the determinations which it contains, Heidegger draws therefrom, I think, so many fundamental determinations which he no longer considers as particular moments of action but, due to his having 'ontologized' the concept of *praxis*, as ontological characteristics of human life. It follows that in his existential analysis one finds, hidden and disguised in an ontological envelope, an entire series of conceptual and terminological correspondences with the Aristotelian conception of *praxis*. But before examining them, it is necessary to insist again upon the nature of the transformation that Heidegger accomplishes in taking up the Aristotelian understanding of *praxis*.

It has already been pointed out how Heidegger, both with and against Husserl, appropriates the Aristotelian characterization of the three fundamentally uncovering attitudes (*praxis*, *poiesis*, *theoria*) and it has already been emphasized that with this appropriation he criticizes the lack of an explicit position on the problem of the fundamentally unitary determination which upholds all the others, and traces this lack back to the metaphysical horizon of presence and to that naturalistic understanding of time which prevents Aristotle from grasping the fact that the unitary structure of human life is originary temporality. Taking up again Aristotle's fundamental indications but freeing them at the same time from the metaphysical hypotheses by which they are conditioned, Heidegger thinks that it is important to reformulate these practical determinations as ontological designations, as modalities of being: this is where one finds the origin of their ontologizing interpretation. In other words: against the theoretical and objectifying unilaterality of modern metaphysics, Heidegger finds it worthwhile to take up again the fundamental intuitions of Aristotle's practical philosophy, intuitions which lie outside such a unilaterality. However, it is still necessary to purify them of the metaphysico-anthropological slag in which they are embedded. From an inadequately pure ontological point of view, the Aristotelian understanding of

praxis is situated in the general framework of a prior conception of man as *animal rationale* and remains bound to the latter. It depends upon and falls with such a conception. According to Heidegger, on the contrary, since the validity of my metaphysical and anthropological framework is in doubt, the practical understanding of human life no longer refers to anything which can be relied upon. Every substantive support which was operative in the tradition is now considered derivative and defective with regard to an originary action, to that *praxis* which constitutes the being of *Dasein* and which must be understood in and for itself regardless of any pre-determination and pre-constitution. In the absence of any region in which it can be constituted, *praxis* has to be self-constituting; and in this way it becomes the originary ontological determination, self-sufficient, its own objective. It becomes *ou heneka*, *Worum-willen*.

Here we come across a fundamental difference. With Aristotle, the practical issue represents a particular way of viewing human life, precisely in as much as the latter is capable of action and in as much as it is itself action. It is therefore just one particular issue among others, alongside, for example, the physical, biological or psychological issue. In addition, it is not a privileged issue but, by virtue of the lesser degree of precision (*akribēia*) to which it lends itself, it has been considered a sort of *philosophia minor*. In any case, it does not exhaust the understanding of human life. With Heidegger, on the other hand, practical determinations are not determinations which exist alongside other possible determinations but represent the ontological constitution of *Dasein* itself. This means that as constitutive, their content is not something that *Dasein* can freely choose to have or not to have but is something from which it cannot be abstracted. Decision, for example, or *praxis* itself, are not conceived as possibilities which *Dasein* can realize or not, but become ontological predicates which characterize its being before, and therefore independent of, its will, its choice, its decision.

This brings with it another displacement in the characterization of *praxis*. There, where it is conceived as a possibility which one can grasp or not, *praxis* takes on a, so to speak, positive connotation. It is a possible way of realizing the being of man but not necessarily the only way. But if it becomes the very ontological structure of *Dasein* it is its inevitable character, the impossibility of avoiding it which is then underlined and accentuated. Hence, *praxis* is not only in question in the execution of determinate actions or in the pursuit of particular goals, it precedes each execution and each pursuit. And it is precisely this characteristic of inevitability, arising from the 'ontologization' of *praxis* as a structure of *Dasein* which confers upon the being of *Dasein* the characteristic of weight, which conveys the impression that the lightness of this being is unbearable.

The 'ontologization' of *praxis* then provokes a last transfiguration. It results, so to speak, in the evaporation of its specific weight as an activity and in the loss of certain characteristics which, with Aristotle, belong to it constitutively; above all, its inter-personality and its rootedness in a *koinonia*. With Heidegger, 'ontologization' drives *praxis* into a sort of heroic solipsism which deforms its very appearance.

So it appears undeniable that the Heideggerian 'ontologization' of the Aristotelian concept of *praxis* provokes some fundamental transformations and displacements. But in spite of these transformations and displacements, the prevailing correspondences will still have to be examined by considering how the Heideggerian determination of the 'open' structure of Dasein takes up again the decisive moments of the Aristotelian understanding of the moral being of man.

7.3 *The articulation of Sorge in the complementary determinations of Befindlichkeit and Verstehen*

It is well known that Heidegger establishes the openness of the being of Dasein, its *Erschlossenheit*, by affirming the originary unity of Dasein and world. The unitary sense of *Erschlossenheit* and of its *Existenzialien*, is care (*Sorge*), its three structural moments are *Befindlichkeit*, *Verstehen* and *Rede*.⁴⁴ However, the simple translation of these terms, almost impossible in any case, does little to help one grasp the meaning which Heidegger confers upon them. Rather, it tends to conceal this meaning. It might be helpful to consider that, with these concepts, Heidegger takes up again, rethinks and elevates to ontological rank so many transitional determinations of the being of man as 'subject' of action, by transforming them and inserting them into the ontologically more profound and more radical context established by his metaphysics of Dasein. In *Befindlichkeit*, he elevates to ontological rank and leads back to its unitary root, the determinations of the acting subject which had traditionally been thought within the framework of the doctrine of the passions, that is to say, as moments of passivity, of receptivity and finitude.⁴⁵ Similarly, in *Verstehen*, I believe that Heidegger ontologizes the active moment of projection and of spontaneity. The two moments are, in addition, co-originary with regard to the third moment, *Rede*, which will be left here in parentheses, but about which one can say that it designates the ontological foundation of the rational and discursive character of Dasein. What has to be underlined is the correspondence of these moments to two central determinations of the Aristotelian theory of action. Let us see how.

*Befindlichkeit*⁴⁶ represents the ontologization of ontic moods in as much as it is the ontological foundation of their possibility. In *Befindlichkeit*, which is rooted in *Sorge*, Dasein is open to its having-to-be. It is confronted with the nudity of its 'daß es ist und zu sein hat', more precisely,

in such a way that its 'whence' (*Woher*) and its 'whither' (*Wohin*) are hidden from it. This is its *Geworfenheit*. What Heidegger wants to point out with this determination is that there belongs to the constitution of *Dasein* not simply elements which are pure, transparent, suited to spontaneity and rationality but also moments which are troubled and opaque, the condition of the possibility of which he tries to determine through the concept of *Befindlichkeit*. For Heidegger, in other words, human life constitutes both itself and its own identity by taking account not only of its transparence, its self-determination and its spontaneity but also in assuming as its own, the opacity of its *Stimmungen*, which latter follows precisely from the fact that it is, in its fundamental structure, *Sorge*. The constitutive function of *Stimmungen* is valid even for the purest attitudes of human life, that is to say, for *theoria*, about which Aristotle says, as Heidegger reminds us, that it can only take place in the calm of *rhastone* and of *diagoge*.⁴⁷

In order to bring out the relation to Aristotle what is important here is that Heidegger, in the very paragraph in which he deals with *Befindlichkeit* (§29) explicitly cites Aristotle, more exactly, the doctrine of the passions (*pathe*), especially as presented in book II of the *Rhetoric*. While disengaging this doctrine from the context in which Aristotle situated it, Heidegger maintains that it has to be interpreted as 'the first systematic hermeneutics of the everydayness of being-with-one-another' (*die erste systematische Hermeneutik der Alltäglichkeit des Miteinanderseins*), and he also notes that since Aristotle hardly any progress has been made in the understanding of the passions, at least until phenomenology. In addition, we also know that Heidegger devoted the lectures of the Summer term 1924 to this ontological reading of the Aristotelian doctrine of the passions. Even if, in order to offer a more precise evaluation, we should wait until this text has been published, one can already affirm without hesitation that this retrieval of the Aristotelian doctrine of the passions plays an important role in the Heideggerian project of a complete and radical comprehension of the structure of human life, comprehension of such a kind that it cannot be reduced exclusively to an analysis of cognitive acts, still less to scientific cognition.

In what concerns the complementary determination with regard to *Befindlichkeit*, that is, *Verstehen*,⁴⁸ one can say very generally that it represents the ontological condition of the possibility of active and spontaneous determinations, of the auto-transparence of *Dasein*. It is the determination which reflects the productivity of capacity (*Seinkönnen*). In spite of the meaning suggested by the German term and even more, by the Latin translations, *Verstehen* indicates the ontological status of *Dasein* in as much as it is activity, in as much as it has the character of *Entwurf*, in as much as it projects its being by relating itself to itself in the practical attitude referred to above. Without entering into the details

of the analysis of this determination, it is enough to take up again the synthetic definition which Heidegger gives of it: *Verstehen* is 'the existential being of Dasein's own potentiality-for-being; and it is so in such a way that this being discloses in itself what its being is capable of'.⁴⁹

The fact that Heidegger considers *Verstehen* as an ontological modality of *Seinkönnen*, that he attributes to it the structure of the project, and that he associates its signification with the ontic signification of 'knowing how to do something' certainly places this determination within the horizon of practical comprehension. To be sure, *qua* ontological, strictly speaking, it precedes any distinction between theory and *praxis*. But that doesn't prevent its thematic connotation, arising from the field of *praxis* and the fundamental features of the phenomenon of acting from which it proceeds, being filtered through the ontological network. If, for example, one takes the retrieval of the treatment of *Verstehen* conducted in the lecture course of the Summer term 1927: *Die Grundprobleme der Phänomenologie*, where the filter for excluding every ontic determination is not so tight as in *Sein und Zeit*, one finds the claim (highly significant for my thesis) that *Verstehen* is 'the true sense of action' (*der eigentliche Sinn des Handelns*).⁵⁰ Heidegger's determination to refuse any interpretation of *Verstehen* in the sense of a cognitive operation opposed to *Erklären* is also, and evidently, directed toward defending the practical conception of *Verstehen*.

But the practical horizon for the Heideggerian comprehension of *Verstehen* also becomes apparent in the function which the latter fulfils in the constitution of the identity of Dasein. The structure of the project proper to *Verstehen* also implies a knowledge, a sight (*Sicht*), which accompanies and orients the projecting. It is the self-knowledge through which Dasein achieves transparence, *Durchsichtigkeit*. This last term is the one Heidegger employs, as he points out himself, to avoid the identity of Dasein being conceived in the horizon of *Warhnehmen*, of *Vernehmen*, of *Beschauen* and of *Anschaun*, that is to say, in the horizon of acts of apprehension of a theoretical kind, acts upon which the traditional understanding of self-consciousness depended. The Heideggerian effort to be rid of the theoretical horizon of presence therefore gets deposited in the determination of *Verstehen* and of *Durchsichtigkeit*; on the other hand, the effort to reach a more originary comprehension of the being of Dasein also gets deposited therein. However, as the terms chosen by Heidegger and the explanations which he gives demonstrate, it seems to me evident that this more radical originality is attained through the ontological exploitation of the thematic field of *praxis*, even if the ontological elimination of every ontic element aims at placing the originary comprehension of the being of Dasein at a more profound level than that of *praxis*, ontologically conceived.

The hypothesis I am going to risk is that through *Verstehen* (and in

spite of all the transformations which are produced and which I do not wish to deny) Heidegger rethinks and reformulates the substantive meaning of the function which, in the Aristotelian theory of action, is filled by the *nous praktikos*. Just as the latter is the complement of *praxis*, so *Verstehen* represents the determination corresponding to *Befindlichkeit*. To be sure, *Verstehen* is not confined within the limits of a theory of action but concerns the totality of *Dasein*: as such it is to be explained with reference to things like *Besorgen* (implying *poietic* and theoretical attitudes), with reference to other things like *Fürsorge*, and with reference to itself as *Worumwillen*. And it has its roots, just like *Befindlichkeit*, in the unitary structure of *Sorge*. And so it obviously finds its place elsewhere than in the *nous praktikos* of the Aristotelian comprehension of action. But in spite of this displacement, in conceiving of the being of *Dasein* as *Sorge*, as complementary to and co-originary with *Befindlichkeit* and *Verstehen*, of *Geworfenheit* and *Entwurf*, of *Reluzenz* and of *Praestruktion*, that is to say, as the unity of passivity and activity, of receptivity and spontaneity, of horizon and constitution, one can say that Heidegger takes up again and reformulates, in an ontologically radicalized framework the same problem as Aristotle grasped and confronted in Book VI of the *Nichomachean Ethics* where he says that man is the *arche* which is at the same time *orexis dianoetike* and *nous orektikos*.⁵¹ And just as with Aristotle the connection of *orexis* and of *nous* always takes place across the *logos*, in an analogous fashion Heidegger theorizes the co-originality of *Befindlichkeit* and *Verstehen* with *Rede*.

To be sure, Heidegger insists upon the differences. He tells us that

care, as an originary totality, 'precedes' in an apriori-existential fashion, any 'behaviour' and 'situation' of *Dasein*: which means that it too is always already to be found therein. It follows that this phenomenon does not in any way express a primacy of the practical attitude over the theoretical attitude. The purely intuitive determination of something present is no less characterized by care than is a 'political action' or calm resignation. 'Theory' and 'praxis' are possibilities of being of a being whose being has to be determined as care.⁵²

This passage, which appears opposed to my thesis, in fact confirms it. For, on the one hand, Heidegger can obviously and with reason proclaim the differences to the extent that he interprets *Sorge* not as a determinate comportment of *Dasein*, whether theoretical, practical or *poietic*, but as the unitary ontological foundation which renders possible all the different comportments. But, on the other hand, in order to specify the essential characteristics of this unitary foundation he has recourse to determinations and to concepts which he borrows from Aristotle's practical philosophy. The very fact that on several occasions he experiences the need

to distract us from an interpretation of *Sorge* in this sense, rather than allaying our suspicions only confirms that it is precisely in this direction that the source of his determination has to be sought.

Similarly when, immediately afterwards, Heidegger says that 'the phenomenon of care in its totality is essentially something that cannot be torn asunder; so any attempts to trace it back to special acts or drives like willing and wishing or urge [*Drang*] and addiction [*Hang*], or to construct it out of these will be unsuccessful'; and when he adds: 'willing and wishing are rooted with ontological necessity in *Dasein's* care; they are not just ontologically undifferentiated experiences occurring in a "stream" which is completely indefinite with regard to the meaning of its being'. This is no less the case with urge and addiction which too are grounded in care in so far as they can be exhibited in *Dasein* at all. In affirming all this Heidegger obviously wants to underline the extreme radicality of his comprehension of the being of *Dasein* as *Sorge* and so to confirm the ontological precedence of *Sorge* with regard to the traditional practical determinations which he mentions. But the necessity of drawing a line between the ontological level of *Sorge* and that of the other determinations depends precisely upon the fact that, outside of all that, and from the thematic point of view, *Sorge* is homogeneous with them. Besides, it is precisely this very homogeneity which allows *Sorge* to be the unitary ontological foundation. Because it is only between homogeneous elements that a relation of foundation can be established.

This homogeneity between care and the other traditional practical determinations of *orexis* and *appetitus*, of inclination and addiction, becomes even clearer and more undeniable in the treatment of the phenomenon which Heidegger handles in the lectures of the Summer term 1925. In this course, Heidegger presents the phenomenon of *Sorge* in a closer relation with the moments of drive (*Drang*) and addiction (*Hang*) which he seems to consider as the explanation for the structure of *Sorge* itself. In spite of the fact that Heidegger never ceases to underline the difference in ontological depth between the traditional determinations and his own, the appearance of *Sorge* in the two moments of *Drang* and *Hang* confirms its correspondence with *orexis* and its two moments of *dioxis* and *phyge*.⁵³

7.4 *Gewissen as the 'ontologization' of phronesis*

In the light of these considerations, one also understands why, as Gadamer recalls, confronted with the difficulty of translating the term *phronesis*, Heidegger could exclaim: 'Das ist das Gewissen!'⁵⁴ Evidently, he was thinking of his determination of conscience (*Gewissen*) as the locus where potentiality for being, the fundamental practical determination of *Dasein*, becomes manifest to itself. In *Sein und Zeit* (§§54–60), it is indeed the case that conscience is characterized as the locus for the

'attestation by *Dasein* of its authentic potentiality-for-being' (*daseinsmäßige Bezeugung eines eigentlichen Seinkönnens*); there, where *Dasein* is ready to listen to the appeal of conscience in the attitude of wanting-to-have-a-conscience (*Gewissen-haben-wollen*) and of resoluteness (*Entschlossenheit*), it is able to attain the authentic realization of existence.⁵⁵ In an analogous fashion, with Aristotle, *phronesis* is the knowledge which constitutes the horizon in which *praxis* can succeed as *eupraxia* and human living, which is, in sum, a *praxis*, can be realized as living well (*eu zen*). And just as with Aristotle, *phronesis* always implies knowledge of *kairos*⁵⁶ so conscience, with Heidegger, is always referred to the *Augenblick*.⁵⁷

So Heidegger certainly had his reason for translating *phronesis* by *Gewissen*; and, for my part, I think I have reason for thinking that *Gewissen* is the ontologization of *phronesis*. The passage from the *Nicomachean Ethics* which arouses the Heideggerian exclamation to the effect that *phronesis* is *Gewissen* furnishes, in my opinion, both the occasion and the motive for an ontologizing operation. Consider the end of chapter 5 from Book VI where Aristotle, after having given a definition of *phronesis* as *hexis elethes meta logou pratike peri ta anthropoi agatha kai kaka*, admits that even this definition does not suffice to entirely exhaust its essence. For it is something more than a *hexis*. Curiously enough, Aristotle does not succeed in saying what it is, but limits himself to developing a proof which confirms his claim: 'any *hexis* can be forgotten but *phronesis* cannot be forgotten'.⁵⁸ I suppose that in reflecting upon this question: in what is *phronesis* 'more'? Heidegger must have arrived at the conclusion that, if it is more than a *hexis* and if, therefore, it cannot be overlooked, it must be a characteristic of the soul itself. It therefore has to be ontologized. But the ontologization of *phronesis* yields as a result *Gewissen*.

7.5 *Entschlossenheit* as the 'ontologization' of *prohairesis* and the other possible correspondences

One could continue this catalogue of correspondences and indicate how the same ontologization is accomplished by Heidegger in the case of other determinations of Aristotle's practical philosophy. I am going to limit myself here to an inventory. With the term *Jemeinigkeit*,⁵⁹ as I have already indicated, Heidegger ontologizes the determination by means of which Aristotle designates a characteristic which belongs to *phronesis*, the fact that it is a 'knowledge concerning the self' (*to hautoi eidenai*). And again: the designation of *Dasein* as *Worumwillen*⁶⁰ is the ontologization of the determination of *praxis* as *hou heneka*. In fact, since the distinctive characteristic of *praxis* is the fact that it is not with reference to anything else (*heneka tinos*) like *poiesis*, but that it contains in itself its own goal (*hou heneka*) and since *Dasein* is pre-eminently an ontologized

praxis, the latter must possess, *par excellence*, the characteristic of *hou heneka*. This is the characteristic that Heidegger attributes to it with the designation *Worumwillen*.

Finally, the determination of *Entschlossenheit*⁶¹ is, in my opinion, the ontologization of *prohairesis*, with this difference, that the latter is situated as a special moment within the Aristotelian theory of action, while *Entschlossenheit* is a characteristic of the being of *Dasein*. An indisputable confirmation of this latter correspondence comes from the fact that, in translating Aristotle, Heidegger renders *prohairesis* by *Entschlossenheit*. Among the passages which attest to this, the one which seems to be particularly significant occurs in the lecture course of Summer 1926, on the *Grundbegriffe der antiken Philosophie*. Heidegger interprets the passage from Book IV, 2 of the *Metaphysics*, where Aristotle differentiates philosophers into dialecticians and sophists, and translates:

Dialektik und Sophistik haben gewissermaßen dasselbe Gewand angezogen wie die Philosophie, aber sie sind es im Grunde nicht; die Sophistik sieht nur so aus. Die Dialektiker zwar nehmen ihre Aufgabe ernst und positiv, sie handeln vom *koinon*, aber es fehlt ihnen die Orientierung an der Idee des Seins. Beide bewegten sich um dasselbe Gebiet wie die Philosophie. Die Dialektik unterscheidet sich durch die Art der Möglichkeiten: sie hat nur begrenzte Möglichkeiten, sie kann nur versuchen; die Philosophie dagegen gibt zu verstehen. Die Sophisten unterscheiden sich durch die Art der Entschlossenheit zur wissenschaftlichen Forshung: sie sind unernst.

What has to be underlined is that Heidegger translates here with *Entschlossenheit zur wissenschaftlichen Forshung* what, in the original Greek, stands as: *prohairesis tou biou*.

8 Conclusive considerations: from Heidegger to Aristotle and from Aristotle to us

I hope that the correspondences I have pointed out will, if not prove, at least render plausible, the general thesis with regard to a retrieval by Heidegger of the framework for the problems posed by Aristotle's practical philosophy, and to a general correspondence between the practical-moral understanding of human life with Aristotle and the Heideggerian existential analysis. With this in mind, I would like to finish up by citing a passage which shows very clearly, and yet again, how Heidegger struggles to get close to Aristotle or, if you prefer, to bring Aristotle close to himself. Towards the end of the lecture on the 'Grundbegriffe der antiken Philosophie', having dealt with the five modalities of the

aletheuein of the *psyche* and the movements which correspond to them, Heidegger poses the problem of the unitary structure of the *psyche*, of the being of human life, and he replies by giving, with Aristotle, the following definition of man: '*anthropos* ist *zoion*, dem die *praxis* zukommt, ferner *logos*. Diese drei Bestimmungen zusammengezogen: *zoe pratike tou logon echontos* ist das Wesen des Menschen. Der Mensch ist das Lebewesen, das gemäß seiner Seinsart die Möglichkeit hat, zu handeln.'⁶²

To be sure, one must also add that in taking up again the Aristotelian determinations of *praxis*, Heidegger 'ontologizes' them and that this ontologization is the equivalent for him of a radicalization. For it permits him to grasp the fundamental unitary connection which upholds these determinations and which is, notoriously, temporality conceived in an originary way (*Zeitlichkeit*). At the end of all this, and once he has carried through his 'ontologization', Heidegger takes up a distance with regard to Aristotle. Aristotle was not able to see originary temporality as the unitary ontological foundation of the determinations of human life which, nevertheless, he grasped and described, because he remains within the horizon of a naturalistic, chronological and non-chairological understanding of time. Even the celebrated aporie of the relation between the *psyche* and *chronos* explicitly raised by Aristotle (*Physik* IV, 14, 223 to 21, 29) which is handled in a magisterial manner by Heidegger in his commentary on the Aristotelian treatment of time,⁶³ seems to be insufficient, in Heidegger's eyes, to extract Aristotle from the horizon of the naturalistic understanding of time.

And yet: Aristotle does anticipate correctly, even if only at the ontic level, the intuition which Heidegger raises to the ontological power with the equation of *Dasein* and *Zeitlichkeit*. This is a conjecture which can be based upon a passage from *De anima* III, 10, where it seems as though Aristotle attributes to man, as a specific characteristic distinguishing him from animals, the perception of time (*chronou aisthesis*).⁶⁴ The attribution is, to tell the truth, controversial; but the fact that Heidegger, who shows that he knows the passage very well, nevertheless interprets it without hesitation in this sense, and the fact that, in addition, he links the perception of time with the capacity for action in order to define the specific character of human life, lends unquestionable credence to this conjecture. To explain the difference between the *orexis* of animals and that reasonable action proper to human life, he refers to the passage mentioned at *De anima* III, 10, and he translates:

Der Gegensatz von Trieb und eigentlich entschlossener, vernünftiger Handlung ist eine Möglichkeit nur bei lebendigen Wesen die Möglichkeit haben, Zeit zu verstehen. Sofern das Lebendige dem Trieb überlassen ist, ist es bezogen auf das, was gerade da ist und reizt, *to ede*

hedy: darauf strebt der Trieb hemmungslos, auf das Gegenwärtige, Verfügbare. Aber dadurch, daß im Menschen die *aisthesis chronou* liegt, hat der Mensch die Möglichkeit, sich *to mellon* zu vergegenwärtigen als das Mögliche, um des willen er handelt.

Can one still remain in doubt about the deep furrow that the voracious interpretation and assimilation of Aristotle has dug in Heidegger's speculative path? Obviously, I think not; but I also think that it is no longer possible to doubt that Heidegger's thinking succeeds in reactivating and reformulating the substantive meaning of certain fundamental problems posed by Aristotle with a radicality of which no one else seems capable today. In this sense, and especially for the phases on which I have concentrated my analysis, this thinking represents one of the most dense and significant moments in the presence of Aristotle in our century. By means of it we are referred back to Aristotle and from Aristotle to us. With a view to gaining an awareness of the problems of the contemporary world, of nihilism and technology, Heidegger has taught us that it is necessary to immerse oneself in the Aristotelian bath – and this before any speculative utopianism, before every form of rebellion or dadaist thinking in which most of those who have wanted to take up his challenge and try to think the problems which we inherited from him, have fallen.

I know that the Heideggerians are going to say: you have completely reduced Heidegger to Aristotle, to the point of finding in Aristotle a correspondence and even an anticipation of the fundamental discovery made by Heidegger at Marburg, the specification of the unitary ontological structure of Dasein in originary temporality. The non-Heideggerians, on the contrary, will protest as follows: what you have tried to pass off as Aristotelian doesn't have much to do with Aristotle and looks more like a philosophical pastiche produced by a fascination with Aristotle.

My response: I know that one has to be on one's guard against this danger but one has to risk it. If I gave the impression of levelling Heidegger down to Aristotle, the optic distortion is inevitable and I apologize for it. I simply wanted to show – against the old existentialist interpretation, and against more recent interpretations which only see in Heideggerian thinking (much too expeditiously and much too rapidly), the overcoming of the tradition – how Heidegger spanned this tradition and entered in depth into a confrontation with its dominant founding moments by reinstating the substantive sense of the confrontation with Greek culture. I am aware that I adopted only one among other possible routes and that I threw light upon only one of the numerous facets of Heidegger's work. I am also aware that what I have done is only a first step on the way to understanding the meaning of Heidegger's speculative path, a step which necessarily has to leave aside other possible readings without moreover trying to compete with them. Finally, I am particularly

aware that the interpretation I have proposed still has to face the explicit retractions undertaken by the second and last Heidegger. But if it is objected that my reading gets under way by neglecting the interpretation Heidegger himself has given to his thinking, I have to reply: if that is a sin, it is a sin I have committed voluntarily. Moreover, I have no intention of repenting.

Translated by Christopher Macann

Notes

1 For the citation of writings by Heidegger published in the *Gesamtausgabe* (Frankfurt: Klostermann, 1975ss.) we will use the sign GA followed by Arabic numerals to indicate the volume.

2 Especially with regard to autobiographical considerations contained in the letter to W. J. Richardson from the beginning of the month of April 1962 and published as the preface to the study by the latter entitled *Heidegger: Through Phenomenology to Thought*, *Phaenomenologica* 13 (La Haye: Nijhoff, 1963), pp. vii–xxiii, and in 'Mein Weg in die Phänomenologie' (1963) reproduced in M. Heidegger, *Zur Sache des Denkens* (Tübingen: Niemeyer, 1969), pp. 81–90; cf. also the preface to the first edition (1972) of the *Frühe Schriften*, reproduced in GA 1, pp. 55–7.

3 I am thinking here, in the first place, of that interpretation and reproduction of Aristotle's practical philosophy proposed by Hans-Georg Gadamer in the celebrated chapter on the contemporary interpretation of Aristotle's Ethics from *Wahrheit und Methode* (Tübingen: Mohr, 1960), of certain interpretations of Eugen Fink (*Metaphysik der Erziehung im Weltverständnis von Platon und Aristoteles* (Frankfurt: Klostermann, 1970), but also of numerous monographs such as: Walter Bröcker, *Aristoteles* (Frankfurt: Klostermann, 1935); Helen Weiß, *Kausalität und Zufall in der Philosophie des Aristoteles* (Bale: Haus zum Falken, 1942); reprinted (Darmstadt: Wissenschaftliche Buchgesellschaft, 1967); Wilhelm Szilasi, *Macht und Ohnmacht des Geistes* (Berne: Francke, 1946) (in particular the second part which contains the interpretations of the *Nichomachean Ethics* VI, *Metaphysics* IX and XII and *De anima* II); Karl Ulmer, *Wahrheit, Kunst und Natur bei Aristoteles. Ein Beitrag zur Aufklärung der metaphysischen Herkunft der modernen Technik* (Tübingen: Niemeyer, 1953); Alfredo Guzzoni, *Die Einkeit des on pollachos legomenon bei Aristoteles* (Freiburg University, Ph.D. thesis, 1957); Ernst Tugendhat, *Ti kata tinos. Eine Untersuchung zu Struktur und Ursprung aristotelischer Grundbegriffe* (Freiburg-München: Alber, 1958); R. Boehm, *Das Grundlegende und das Wesentliche. Zu Aristoteles' Abhandlung 'über das Sein und das Seiende (Metaphysik Z)'* (La Haye: Nijhoff, 1965); Ernst Vollrath, *Studien zur Kategorienlehre des Aristoteles* (Ratingen: Henn, 1969), and *Die These der Metaphysik. Zur Gestalt der Metaphysik bei Aristoteles, Kant and Hegel* (Ratingen: Henn, 1969), pp. 15–92; Fridolin Wiplinger, *Physis und Logos. Zum Körperphänomen in seiner Bedeutung für den Ursprung der Metaphysik bei Aristoteles* (Freiburg-München: Alber, 1971); Ute Guzzoni, *Grund und Allgemeinheit. Untersuchung zum aristotelischen Verständnis der ontologischen Gründe* (Meisenheim: Hain, 1975); Karl-Heinz Volkmann-Schluck, *Die Metaphysik des Aristoteles* (Frankfurt: Klostermann, 1979); Ingeborg Schüßler, *Aristoteles*,

Philosophie und Wissenschaft. Das Problem der Verselbständigung der Wissenschaften (Frankfurt: Klostermann, 1982).

5 In 1976 in GA 21 (text established by Walter Biemel).

6 In 1975 in GA 24 (text established by Friedrich-Wilhelm von Herrmann).

7 In 1981 in GA 33 (text established by Heinrich Hüni).

8 In 1983 in GA 29–30 (text established by Friedrich-Wilhelm von Herrmann).

9 GA 18.

10 GA 19.

11 GA 22.

12 Appeared in 1985 in GA (text established by Walter Bröcker and Käte Bröcker-Oltmanns).

13 Cf. E. Husserl, *Briefe an Roman Ingarden*, *Phaenomenologica* 25 (La Haye: Nijhoff, 1968), pp. 25–7. In a letter addressed to Gadamer (from the year 1922) Heidegger sets out in detail the contents of this interpretation: 'First part (ap. 15 sheets) deals with *Nich. Eth. Z*, *Met. A*, 1–2, *Phys. A*. 8; the second (same length) *Met. ZHQ*, *De motu an.*, *De anima*. The third part appears later. Since the Jahrbuch will be published later I can offer you a separate copy.' The letter is quoted in G.-G. Gadamer, *Heideggers Wege* (Tübingen: Mohr, 1983), p. 118. (Gadamer lost the copy of the manuscript Heidegger had sent him during the bombing of Leipzig, but another copy of the manuscript has since been found and published in *Dilthey-Jahrbuch*, 6 (1989), pp. 228–69.

14 Notoriously, Heidegger clarifies the meaning of the 'phenomenological destruction' of the history of ontology in *Sein und Zeit* (GA 2), §6. Further valuable information is to be found in the lectures of Summer 1927, *Die Grundprobleme der Phänomenologie*, where one learns how Heidegger is able to get the idea of a destruction from an extension of the Husserlian method of reduction and how, as a result, he conceives the triple articulation of the phenomenological method of reduction, destruction and construction (cf. GA 24, §5).

15 Cf. Heidegger, *Zur Sache des Denkens*, p. 81.

16 Cf. F. Brentano, *Von der mannigfachen Bedeutung des Seienden nach Aristoteles* (Freiburg: Herder, 1862; reprinted Hildesheim: Olms, 1960).

17 In addition to Brentano's dissertation, Heidegger also mentions the treatise by Carl Braig, *Vom Sein, Abriß der Ontologie* (Freiburg: Herder, 1896); for the analysis of the contents of this last work, in connection with the genesis of the problem of Being in the young Heidegger, I refer the reader to my monograph *Heidegger e Aristotele* (Padova: Daphne, 1984), pp. 52–64.

18 M. Heidegger, *Die Kategorien- und Bedeutungslehre des Duns Scotus* (1915), reprinted in GA 1, pp. 189–411.

19 In a later but nevertheless very interesting statement which is to be found in the lecture course of Summer 1931, Heidegger says:

Since medieval times, the first proposition of *Met. IX*, 1, had served as the basis for the conclusion that the fundamental meaning of being in general – even for the four meanings together, not just for one (the categorial meaning) and its multiplicity – was *ousia*, which it was customary to translate as 'substance'. In the 19th century this tendency became even more pronounced (especially with Brentano) because, in between, being-possible and being-real had been recognized as categories. This is the reason why it has become a received opinion that the Aristotelian doctrine of being was a 'doctrine of substance'. This is a mistake, issuing in part from an inadequate interpretation

of pollachos; more precisely, it was not understood that what was being opened up here was simply a question. (Even W. Jaeger's reconstruction of Aristotle was based upon this error.)

(GA 33, pp. 45-6)

20 GA 24, p. 31. In the same context of the Heideggerian development of the phenomenological method one finds illuminating indications in the ontological orientation which Heidegger provokes in the self-understanding of phenomenology. The latter is not a redirection of the natural attitude towards a philosophical disposition which opens up a perspective on the constitutive operations of subjectivity but it brings about a transition for any ontic consideration of being to its ontological consideration, that is, to a consideration which bears upon the modalities of being and, therefore, upon the being of beings. But listen to Heidegger:

Being must be grasped and thematized. . . . The apprehension of being, that is, phenomenological research, is directed necessarily and in the first instance at beings, but only in order to be definitively re-directed from beings and led back to their being. The fundamental element in the phenomenological method, in the sense of a leading back of the questioning from beings naively apprehended to being, we designate by the expression *phenomenological reduction*. Therewith we make use of a central term of Husserl's phenomenology, though only in a nominal and not in a real way. *For Husserl*, the phenomenological reduction, which he first worked out expressly in *Ideas*, is a method for reading back the phenomenological viewpoint from the natural attitude of humans living with each other in a world of things, to the life of transcendental consciousness and its noetic-noematic lived experiences in which objects are constituted as correlates of consciousness. *For us*, the phenomenological reduction means the leading back of the phenomenological viewpoint from an apprehension of beings (however determined) to an understanding of their being.

(GA 24, pp. 28-9)

Here, as also in the objections advanced on the occasion of the drafting of the *Encyclopedia Britannica* article, the Heideggerian critique of Husserlian phenomenology seems not to be an immanent critique which moves back within the Husserlian position to its specific presuppositions. In my opinion, it assumes the form of a sort of ontological torsion which gets away from the Husserlian position right away and, so to speak, attacks it from the rear. And it has to be added that Heidegger introduces, with reference to Husserl, a decisive change not only in the attempt to understand the philosophical approach in an ontological and non-transcendental sense but also in the attempt to understand the motives which provoke the redirection of the natural attitude towards the philosophical. The redirection does not consist in a fictive operation which takes place in the head of the professional philosopher but lies rooted in a fundamental *Stimmung*, that is in an anxiety in which the conversion from inauthenticity to authenticity is prefigured and in which, consequently, there takes place that assumption of the existential disposition which is the philosophical disposition *par excellence*.

21 GA 20, pp. 13-182. The original subtitle of the lecture 'Prolegomena zu einer Phänomenologie von Geschichte und Natur' very clearly announces Heidegger's intention to keep close to Husserlian phenomenology, at least with respect to its terminology.

22 Cf. M. Heidegger, *Sein und Zeit*, §44, and GA 21, p. 129.

23 These positions are presented in the 6th *Logical Investigation* (sect. II, chap. VI: 'Sinnlichkeit und Verstand') which is the Husserlian text to which Heidegger prefers to refer. With regard to the confrontation between Heidegger and Husserl, I refer the reader to what I have written in 'Heidegger in Marburg: Die Auseinandersetzung mit Husserl', *Philosophischer Literaturanzeiger*, 37 (1984), pp. 48–69, and in 'La trasformazione della fenomenologia da Husserl a Heidegger', *Teoria*, 4(i) (1984), pp. 125–62.

24 One can find this argumentative progression in the lecture from the Winter term 1925/6 (cf. GA 21, p. 1, Hauptstück). It can also be found in that of the Winter term 1929/30 (GA 29/30, §72–3), where the quest for the ontological foundation of the phenomenon of truth takes a significant turn. The emphasis is no longer on the uncovering attitude of *Dasein*, but rather on its being-free (*Freisein*), that is, no longer on the spontaneity and the productivity of *Dasein*, but on the ontological character (being-free) of the horizon constitutive of its condition. Finally, it can be found in the lectures from the Summer term 1930 (GA 31, §9), where, in interpreting *Metaphysics* IX, 10, Heidegger concentrates on the *on hos alethes*.

25 Cf. Aristotle, *Nicomachean Ethics* VI, 3, 11139 b 15–17.

26 Cf. Aristotle, *De anima* III, 3, 427 b 12; 428a 11, 428 b 18.

27 Cf. Aristotle, *Metaphysics* IX, 10. Heidegger, at least twice, spends a considerable time on the interpretation of this critical chapter of the *Metaphysics*, in the lectures from 1925/6 (GA 21, pp. 170–82) and in that of 1930 (GA 31, pp. 73–109).

28 Heidegger insists upon this differentiation in the introduction to the lectures from the Winter term 1924/5, to wit: (1) *to pragma esti alethes*, (2) *he psyche aletheuei*, (3) *ho logos hos legein aletheuei*, (4) *ho logos hos legomenon esti alethes*. Obvious traces of this topology of the loci of truth are to be found in *Sein und Zeit*, §§7B and 44.

29 GA 21, p. 190.

30 GA 21, pp. 193–4.

31 As is well known, the Heideggerian critique of Husserl's understanding of consciousness makes itself known on the occasion of their unsuccessful collaboration on the drafting of the article on phenomenology for the *Encyclopedia Britannica*. The different drafts of this article and Heidegger's critical remarks have been published in *E. Husserl, Phänomenologische Psychologie, Vorlesung Sommersemester 1925*, ed. W. Biemel, Husserliana IX (La Haye: Nijhoff, 1962). Cf. in addition the article by W. Biemel, 'Husserl's Encyclopaedia-Britannica-Artikel und Heideggers Anmerkungen dazu', *Tijdschrift voor Filosofie*, 12 (1950), pp. 246–80. Today, it is also necessary to take into account the detailed articulation of the Heideggerian critique in the university lectures: cf. GA 20, §§4–13; 21, §§6–10; §§4–5. A confrontation with Husserl (more exactly with the article 'Philosophie als strenge Wissenschaft') is also to be found in the first Marburg lectures (*Der Beginn der neuzeitlichen Philosophie*, 1923–4, GA 17).

32 Confirmation of this correspondence comes from the suggestive conjunction that by *Vorhandenheit* Heidegger translates (and, I would add, 'ontologizes') the Aristotelian idea of wonder (*thaumazein*), in which the desire for knowledge is rooted: '*dia gar thaumazein hoi anthropoi kai nun kai to proton erxanto philosophēin, ex arches men ta procheira ton atupon thaumasantes*' (Aristotle, *Metaphysics* I, 2, 982b 12–13).

33 Cf. M. Heidegger, *Sein und Zeit*, §16 and also 69b.

34 Traces of this understanding and of this suggestion can be found first in

texts from this period published by Heidegger himself: from the *Anmerkungen zu Karl Jaspers' 'Psychologie der Weltanschauungen'* (1919/21; GA 9) to the book on *Kant und das Problem der Metaphysik* (1929; GA 3). For example, in the lecture 'Phänomenologie und Theologie' (1927) one finds the statement: 'Existieren [ist] Handeln, *praxis*' (GA 9, p. 58). But they are to be found explicitly elsewhere, especially in university lectures, notably in the introductory part of the lecture from the Summer term 1924/5 on the *Sophist* and in the concluding part of the latter from the Summer term 1926 on the 'Grundbegriffe der antiken Philosophie'. While waiting for these texts to be published, one can draw valuable hints from the book by H. Weiß, *Kausalität und Zufall in der Philosophie des Aristoteles*; H. Weiß, who attended the lectures given by Heidegger, makes a fairly circumstantial summary of the Heideggerian interpretation of Aristotle's practical philosophy in chap. 3 of his book, by entitling it significantly: 'Menschliches Dasein – praxis' (pp. 99–153).

35 The practical structure of the reference of Dasein to its being has been well analysed by E. Tugendhat, *Selbstbewußtsein und Selbstbestimmung. Sprachanalytische Interpretationen* (Frankfurt: Suhrkamp, 1979), pp. 164–244.

36 The withdrawal of the emphasis placed upon the practical connotation of Dasein as having-to-be and the substitution for the former of a thematization of its ontological horizon as ek-sistence is to be found in numerous writings, for example, in the last part of *Was ist Metaphysik?* (1929), in *Vom Wesen der Wahrheit* (1930, 1943), especially in §4, in *Einleitung in die Metaphysik* (1935), in the *Brief über den Humanismus* (1946), in the *Einleitung* to the 5th edition (1949), of *Was ist Metaphysik?*, and besides in marginal notes from the 'Hütten-exemplar' of *Sein und Zeit*, published in the GA 2. In what concerns the emphasis accorded to Aristotle, I find it very significant that the conversion from one perspective to the other should be clearly announced in the reproduction of the interpretation of the phenomenon of truth with Aristotle, previously handled in the lectures of 1925/6 and in the lectures of 1929/30 in an interpretative direction that Heidegger himself declares to have been altered (cf. GA 29/30, §72–3).

37 Cf. GA 20, p. 380. Previously, in place of *Sorge* Heidegger had employed the term *Selbstbekümmern* (corresponding to the Greek *epimeleia*), a use which one finds, for example, in the review of Jaspers's *Psychologie der Weltanschauung* (cf. GA 9, pp. 1–44, in particular pp. 30–5), and in the lecture course of the Summer term 1920/1 *Einleitung in die Phänomenologie der Religion*.

38 Cf. for example Aristotle, *Nichomachean Ethics* VI, 2, 1139b 7–11, and III, 5.

39 *ibid.*, VI, 1141b 34.0.

40 In a revealing note from *Sein und Zeit*, §42, for example, Heidegger says that if he

came to accord a dominant role to that 'care' which governs the previous analytic of *Dasein*, it is in the context of his attempts to interpret the Augustinian anthropology – that is the Greco-Christian – with reference to the foundations established in the Aristotelian ontology.

The fact that Heidegger here talks only of the Aristotelian ontology and does not mention the practical philosophy should not deceive us for, according to him, the latter is also an ontology and, more specifically, an ontology of human life.

41 '*Ho de bios praxis, ou poiesis estin*' (Aristot. *Politics* I, 4, 125a 7).

42 Aristotle, *Nichomachean Ethics* VI, 5, 1040a 26.

43 Cf. Aristotle, *Eudemian Ethics* II, 3, 1220b 27 and 6, 1222b 19.

44 Cf. Heidegger, *Sein und Zeit*, §§39–45.

45 The fact that Heidegger translates the Augustinian term affection with *Befindlichkeit* brings an important counter-proof against this association. It is to be found in the lecture *Der Begriff der Zeit* (1924), where Heidegger quotes Augustin *Lecture XIII*, 27:

in te anime meus, tempora metior, noli mihi obstrepere quod est. Noli tibi obstrepere turba affectionum tuarum. In te, inquam, tempora metior. Affectionem, quam res praetereuntes in te faciunt, et, cum illae praeterient, manet, ipsam metior praesentem. Non eas, quae praeterierunt, ut fieret: ipsam metior cum tempora metior.

Heidegger paraphrases:

In Dir, mein Geist, messe ich die Zeiten. Dich messe ich, so ich die Zeit messe. Komme mir nicht mit der Frage in die Quere: Wie denn das? Verleite mich nicht dazu, von dir wegzusehen durch eine falsche Frage. Komme dir selbst nicht in den Weg durch die Verwirrung dessen, was dich selbst angehen mag. In dir, sage ich immer wieder, messe ich die Zeit; die vorübergehend begegnenden Dinge bringen dich in eine Befindlichkeit; die bleibt, während jene verschwinden. Die Befindlichkeit messe ich in dem gegenwärtigen Dasein, nicht die Dinge, welche vorübergehen, daß sei erst entstände. Mein Mich-befinden selbst, ich wiederhole es, messe ich, wenn ich die Zeit messe.

(M. Heidegger, *Der Begriff der Zeit*, ed. H. Tietjen (Tübingen: Niemeyer, 1989), pp. 10–11.

46 Cf. Heidegger, *Sein und Zeit*, §29.

47 Cf. Aristotle, *Metaphysics* I, 2, 982b 22, quoted by Heidegger, *Sein und Zeit*, §29.

48 Cf. Heidegger, *Sein und Zeit*, §31.

49 'Das existenziale Sein des eigenen Seinkönnens das Dasein selbst, so zwar, daß dieses Sein an ihm selbst das Woran des mit ihm selbst Seins erschließt' (Heidegger, *Sein und Zeit*, §31).

50 *GA* 29, p. 393.

51 Aristotle, *Nicomachean Ethics* VI, 2, 1139b 4–5. Cf. the treatment of *orexis* in Heidegger, *Nietzsche*, vol. I (Pfullingen: Neske, 1961), pp. 66–8.

52 Heidegger, *Sein und Zeit*, §41.

53 Cf. Aristotle, *Nicomachean Ethics* VI, 2, 1139a 21–3. The correspondence between *Sorge* and *orexis* is all the more interesting in that Heidegger goes out of his way to find a determination corresponding to *Sorge* not only in Aristotle but also in Kant. He thinks he can find it in the *Gefühl der Achtung*, which is at the bottom of *personalitas moralis* (cf. *GA* 24, pp. 185–99). Heidegger emphasizes explicitly that the Kantian concept of *Gefühl der Achtung*, conceived on the analogy of such opposed determinations as *Neigung* (which arises in the course of the self-elevation of practical reason) and *Furcht* (which arises in the course of the submission of the law) would correspond to the Aristotelian concept of *orexis* with its two moments of *dioxis* and *phyge* (cf. *GA* 24, pp. 192–3).

54 Cf. H.-G. Gadamer, *Martin Heidegger und die Marburger Theologie* (1954), reproduced in the already cited collection by the same author, *Heideggers Wege*, pp. 29–40, in particular pp. 31–2. But cf. also the slightly different version of

the same episode in H.-G. Gadamer, 'Erinnerung an Heideggers Anfänge', *Itinerari*, 25 (1-2) (1986) (dedicated to Heidegger), pp. 5-16, esp. p. 10.

55 The importance of conscience for Heidegger can be measured by the fact that in 'Anmerkung zu Karl Jaspers' *Psychologie der Weltanschauung*' Heidegger has already made known the need to analyse this concept and its history in connection with the problematic of existence, and not simply as if it were a matter of a task of scholarship (cf. *GA* 9, p. 33).

56 Cf. for example, Aristotle's *Nichomachean Ethics* I, 4, 1096a 26, 32 (where *kairos* is defined as *to agathon en chronoi*) or III, 1, 1110a 14 (where Aristotle says that the *telos tes praxeos* is *kata ton kairon*).

57 Cf. Heidegger, *Sein und Zeit*, §68.

58 '*Lethe tes men toiautes hexeos estin, phroneseos de ouk estin*' (Aristotle, *Nichomachean Ethics* VI, 5, 1140b 29).

59 Cf. Heidegger, *Sein und Zeit*, §9.

60 Cf. Heidegger, *Sein und Zeit*, §§18, 26, 41, 69c.

61 Cf. Heidegger, *Sein und Zeit*, §§60, 62.

62 The end of this passage is also important: 'Derselbe Mensch taucht dann wieder bei Kant auf: der Mensch der reden, d.h. begründend handeln kann.' It is not necessary to note that it is a question of the same man that one finds in Heidegger.

63 Cf. *GA* 24, §19a.

64 Cf. Aristotle, *De anima* III, 10, 453b 5-8.

Meister Eckhart and the later Heidegger: the mystical element in Heidegger's thought

John D. Caputo

Part one

I Heidegger and medieval mysticism

In the 'Introduction' to his habilitation dissertation at Freiburg, *The Doctrine of Categories and of Meaning in Duns Scotus* (1916), the young Heidegger praised the 'objective' orientation of medieval philosophy: 'Scholastic psychology, precisely inasmuch as it is not focussed upon the dynamic and flowing reality of the psychical remains in its fundamental problems oriented towards the objective and noematic, a circumstance which greatly favors setting one's sight on the phenomenon of intentionality' (*DS*, 15).¹ While modern philosophy is characterized by a keen sense of subjective experience, the Scholastic thinker is concerned primarily with the object of knowledge, with 'being'. The Scholastic, he says, is typified by an 'absolute surrender' to the 'content' of knowledge (*DS*, 7). In a sentence which is prophetic in the light of what he would later call the 'subject matter of thinking' (*die Sache des Denkens*) Heidegger observes: 'The value of the subject matter [*Sache*] (object) dominates over the value of the self (subject)' (*DS*, 7). Because thinking 'tends into' (*intendere*) being, the medievals spoke of the 'intentional' character of knowledge. Thus the Scholastics' neglect of subjective experience at least kept them free of the 'unphilosophy of psychologism' (*DS*, 14). Heidegger found in the medievals an anticipation of the work of Husserl, who would come to Freiburg this same year (1916) and whose *Logical Investigations* he had been studying for some time (*ZSD*, 82). Both Husserl and the author of *De modis significandi*² reject the reduction of the laws of logic to the empirical constitution of the human mind; both

seek a 'pure' grammar which delineates unchanging relationships between the parts of speech and which holds true *a priori* of every possible empirical language (*DS*, 149–50). The simple but challenging task for thinking in the medieval world was to subordinate the 'individuality of the individual' (*DS*, 7) to the demands of the subject matter, to its unchanging structures and 'objective meanings'. That is why one can read through the great *Summae* of the thirteenth century without once catching a glimpse of the personalities of their authors.

But it would be a mistake, Heidegger contends, to think that behind the objectivity and formalism of the Scholastic there is nothing 'living'. On the contrary, 'the theoretical posture of the spirit is only one' of its possible attitudes and perhaps not even the most important (*DS*, 236). Hence the text we cited above continues:

In order to reach a decisive insight into this fundamental character of scholastic psychology, I consider a philosophical, or more exactly, a phenomenological examination of the mystical, moral theological and ascetical literature of medieval scholasticism to be especially urgent. In such a way alone will one push forward to what is living in the life of medieval scholasticism. . . .

(*DS*, 15)

Behind the impersonal disputations of the scholastics there is the life of the soul which seeks God in the practice of morality and asceticism. The speculative theology and philosophy of the Middle Ages is not opposed to its mystical tradition but rather expresses in a conceptual way what the mystic has experienced:

If one reflects on the deeper essence of philosophy in its character as a philosophy of world-views, then the conception of the Christian philosophy of the Middle Ages as a scholasticism which stands in opposition to the contemporaneous mysticism must be exposed as fundamentally wrong. In the medieval world-view, scholasticism and mysticism belong essentially together. The two pairs of 'opposites' rationalism–irrationalism and scholasticism–mysticism do not coincide. And where their equivalence is sought, it rests on an extreme rationalization of philosophy. Philosophy as a rationalist creation, detached from life, is powerless; mysticism as an irrationalist experience is purposeless.

(*DS*, 241)

Philosophy is the conceptualization of what the living historical man experiences. And for the young Heidegger, the experience of the mystic is the experience of medieval man intensified and 'writ large'.

The Heidegger who offers this sensitive interpretation of medieval thought is not only conversant with Husserl's 'transcendental phenomenology', but is equally concerned with the problem of history, and especially with the work of Wilhelm Dilthey, whose *Collected Writings* were a significant source of his reflections in 'the exciting years between 1911 and 1914',³ and of Heinrich Rickert, his mentor at Freiburg to whom the *Habilitationsschrift* is dedicated. With Dilthey and Rickert, the young Heidegger speaks of the necessity of understanding an historical epoch in terms of its 'goals': 'But where it is a matter of reaching a living understanding of an "age" and of the accomplishments of the spirit that were productive in it, then an interpretation of its meaning which is guided by an ultimate conception of its goals becomes necessary' (*DS*, 231). And this is what he says he hopes to find in a study of medieval mysticism. For philosophy cannot be content with the abstract, thinking subject: 'The epistemological subject does not signify the most important meaning of the spirit, let alone its whole content' (*DS*, 237–8). Philosophy must penetrate to the living, historical spirit. Thus philosophy must go beyond logic and the theory of knowledge to metaphysics itself. One can already see the author of *Kant and the Problem of Metaphysics* (*KPM*, 25–6): 'One cannot see logic and its problems in a true light unless the context in which they are interpreted is translogical. *Philosophy cannot for long dispense with its true optics, metaphysics*' (*DS*, 235). There is need for a 'metaphysical-teleological interpretation of consciousness' (*DS*, 235): metaphysical, because it goes beyond the logico-epistemological view of consciousness to the living historical spirit; teleological, because the living spirit is end-directed and meaning-seeking.⁴

No inquiry into medieval thought can prescind from 'the world of experience of medieval man' (*DS*, 235). 'The fundamental structure', Heidegger says, of the 'whole attitude of life of medieval man' is to be found in what he calls 'the transcendent and primordial relationship of the soul to God' (*in dem transzendenten Urverhältnis der Seele zu Gott*: *DS*, 1). In this relationship, neither the absoluteness of God nor the integrity of the soul is destroyed, but the soul – 'stretching out into the transcendent' – is given to share in God's absolute value. This contrasts sharply, he says, with our 'modern experience', whose richness and variety is measured by its absorption in the 'breadth of content' (*inhaltliche Breite*: *DS*, 240) of sensible reality. The medieval man subordinated the variety and multiplicity of the sensible world to a 'transcendent goal'.

The importance of these texts for the historian of Heidegger's development should not be underestimated. For the notion of the soul 'stretching out into the transcendent', of the primordial and transcendent relationship of the soul to God, foreshadows the relationship of *Dasein*⁵ to

Being. As the soul transcends beyond the multiplicity of sensible things in the world to God Himself, so Dasein transcends beings to Being itself.

Of all the medieval mystics, Heidegger draws special attention to Meister Eckhart,⁶ a thinker in whom the unity of 'mysticism' and 'philosophy' (*DS*, 241) is clearly exemplified. For not only was Eckhart one of the outstanding figures in the history of medieval mysticism, he was also one of the great Dominican 'masters' at Paris. Some forty years later, Heidegger would say: 'The most extreme sharpness and depth of thought belongs to genuine and great mysticism. . . . Meister Eckhart testifies to it' (*SG*, 71). The evidence of Heidegger's interest in Meister Eckhart at this time is indisputable. The 1915 inaugural lecture, 'The concept of time in the science of history', begins with a citation taken from Eckhart on the distinction between time and eternity.⁷ In 1919 Heidegger held a lecture course on *The Philosophical Foundations of Medieval Mysticism* in which the role that Eckhart played is testified to by the fact that a student in this course wrote a book on Eckhart, approaching him from a very Heideggerian point of view.⁸ And in the habilitation dissertation itself Heidegger promises us a work of his own on Meister Eckhart: 'I hope on another occasion', he says, 'to be able to show how Eckhartian mysticism first receives its philosophical interpretation and evaluation' in connection with 'the metaphysics of the problem of truth' (*DS*, 232, n. 1).

What does Heidegger mean by an interpretation of Eckhart in terms of the 'metaphysics of truth?' A metaphysical investigation, we have seen, means an historical-teleological analysis of the living spirit, which in the case of medieval philosophy centers on the notion of the transcendent relation of the soul to God. 'Truth' for the medieval philosopher means the 'true' (*verum*), which is the 'transcendental' relationship between thinking and being (*DS*, 80ff.). The 'true' is convertible with 'being' (*ens*) itself, and so 'transcends' the categories (of Aristotle); every being as such is true. In a text that Heidegger would later cite in *Being and Time* (*SZ*, sec. 4, p. 14), Aquinas calls the true a 'relational transcendental', i.e., one that arises from being considered in relationship to something, in this case to the intellect.⁹ According to the scholastic notion of the true, every being is accessible to thought and all thinking is directed to being. Thus if the significance of Eckhart is to be found in connection with the metaphysics of truth, then this must mean that the living relationship between the soul and God represented in Eckhart's mysticism constitutes a 'model' (*SD*, 54) in terms of which one can conceive the relationship between thinking and being. The relational transcendental (truth) is to be thought of in terms of the transcendent relation (of the soul to God).

Whether this is what Heidegger meant in 1916 we cannot be sure because the work on Meister Eckhart never appeared, nor have the

lectures of 1919 been published. It is in any case a suggestion which Heidegger himself pursued in his own later works. For there is no stronger analogy to the relation between Dasein and the coming to pass of the Truth of Being in Heidegger's later thought than that between the soul and God in Eckhart. The extensive parallels between Eckhart and the later Heidegger are not accidental. Moreover, if Heidegger's references to the writings of Eckhart are any indication, his interest in the Meister never subsided. In the works that have appeared since 1947 Heidegger cites Eckhart seven times to our knowledge. Twice (*K*, 39; *VA*, 175) he cites directly from the Middle High German text. On two other occasions (*WD*, 95–6; *G*, 36) he refers to pivotal elements in Eckhart's teachings. Twice (*SG*, 71; *FW*, 4) he comments upon the depth of this man whom he has called both a 'master of thinking' (*VA*, 175) and a 'master of life' (*FW* 4). On a seventh occasion (*FND*, 76) he refuses to call Eckhart a 'modern' and therefore – for Heidegger – a 'subjectivistic' thinker. Moreover, Heidegger's description of thinking as *Gelassenheit* (mhd. *gelâzenheit*) employs Eckhart's very vocabulary, as Heidegger himself points out (*G*, 36).

Heidegger has said that his beginnings in theology have determined his path of thought (*US*, 96). Hitherto it has been thought that Heidegger's theological interests culminated in his concern with Kierkegaard in *Being and Time* and in his discussions of 'hermeneutics' in the later work. But it seems to us that a decisive source of Heidegger's thought in Western theology has up to now been overlooked, viz., Meister Eckhart.¹⁰ The main burden of the present study, then, is first, to show the extensive parallels that exist between Eckhart and Heidegger and, secondly, to assess their philosophical significance. For after having shown that a relationship exists, one must still determine what to make of it. Are we to suppose, e.g., that 'thinking' (*Seinsdenken*), as Heidegger conceives it, and mysticism are the same?

One last remark before proceeding with this analogy. The relationship between Heidegger and Eckhart is a suggestive theme for the historian of German philosophy, for it brings together the earliest and the latest stages of German speculation. It suggests a fundamental continuity in German thought whose middle term is surely the great idealist systems of the nineteenth century. In Eckhart, the Idealists and Heidegger, one finds a similar structure: a transcendent reality (God, the Absolute, Being) comes to pass in man; and man is conceived not 'anthropologically' but ontologically as the locus of the realization of the transcendent (as the 'ground of the soul', 'spirit', 'Dasein'). This is a topic of such proportions that we cannot hope to do it justice in these pages. We must be content to offer suggestions about it where space permits. Moreover, we do not hold that the relation of Heidegger to Eckhart is mediated by the Idealists, but that it grows directly out of Heidegger's acquaintance

with Eckhart from his earliest studies in Scholasticism, and out of the aborted effort he made to discover 'what was living in the life of medieval scholasticism' (*DS*, 15; cf. *infra.*, n. 31).

The analogy between Heidegger and Eckhart can be conceived in terms which Heidegger has himself suggested. Speaking in 1960 to theologians at Marburg interested in his work, Heidegger recommended the following analogy: Being : thinking :: God : the thinking conducted within faith.¹¹ This structure, derived from the medieval doctrine of analogy (*DS*, 70ff.), is called the 'analogy of proportionality'. It signifies a similarity of relationships, a proportion of proportions. And it is an apt formula as well for relating Eckhart and Heidegger: as God is to the soul in Eckhart, so Being is to Dasein in Heidegger. This does not imply that Being is 'really' God, or that Heidegger has 'substituted' Being for God, for the relationship of the terms of this analogy is not direct but structural: each plays a similar role within similar structures.

Having established Heidegger's interest in Eckhart, our procedure now will be as follows: to work out the relation of the soul to God in Meister Eckhart (II); to compare the relation of Being and Dasein with Eckhart's mysticism (III); and finally, to examine the import of this comparison for our understanding of Heidegger (IV).

II Eckhart's speculative mysticism

Our analysis of Eckhart will begin with a discussion of the metaphysical account of God in his Latin writings. We will then examine the major themes of his mystical doctrine, the 'ground of the soul', the 'birth of the Son' and 'detachment', in his vernacular works. The metaphysics will provide a speculative foundation for the mysticism; the mysticism will offer the 'living' correlate to the metaphysics.

The metaphysics of God

In the 'Prologues' to the *Opus Tripartitum*, Eckhart sets out the 'first proposition' from which, if one is careful, nearly all that can be known of God can be deduced (*LW*, I, 165). The proposition is: being is God (*esse est deus*). He does not say, as did Aquinas, that God is being (*deus est suum esse*), but he adopts instead the more extreme expression that being is God. Aquinas, realist and Aristotelian, emphasized that creatures possessed their own proper and proportionate share in being, while God possessed the unlimited fullness of being itself. But the mystic Eckhart stresses instead the radical dependency of creatures upon God.¹² Of itself, he says, the creature is 'absolutely nothing' (*nihil penitus*), a 'pure nothing' (*ein reines Nichts*: *Q*, 170), not even a modicum. The creature does not have being 'in itself' at all, but only 'in God'. Created

things have being, Eckhart holds, the way air has light (LW, II, 274–5). The air does not ‘possess’ the light; it simply receives it for as long as the sun illumines it. The light is not ‘rooted’ in the air, but in its source, the sun. In the same way, the creature does not ‘possess’ being, has no ‘hold’ on it, but instead continuously receives being from its source, being itself. Being is God, that is to say, being belongs properly only to God, in whom alone it is originally ‘rooted’ (LW, II, 282).

If being is God then it follows that nothing of the perfection of being is lacking to Him. God is the purity and plenitude of being (*plenitudo esse, purum esse*: LW, III, 77). He precontains and includes (*praebeat et includat*: LW, I, 169) in a preeminent way the limited and multiple perfections which have been ‘lent’ (Q, 119–20) to creatures. Moreover, if being is God, then God is ‘one’. He possesses His being in a timeless simplicity which entirely excludes the successiveness and multiplicity, i.e., the ‘negativity’ of creatures. God is the ‘negation of negation’ (*negatio negationis*: LW, I, 175).¹³

The neoplatonic emphasis which Eckhart places on the ‘unity’ of the divine being is developed in the German works in terms of the distinction between the ‘Godhead’ (*Gottheit, divinitas*) and ‘God’ (*Gott, deus*). ‘God’ refers to the divine being insofar as it is related to creatures and consequently insofar as it is named on the basis of these relationships. Hence ‘God’ is called good as the cause of the goodness of creatures, wise because of the order He has established in the universe, etc. But the ‘Godhead’ is the divine being insofar as it remains concealed behind all the names which are attributed to Him. The Godhead is the ‘One’ which is purer than goodness and truth, which is even prior to the Son and the Holy Spirit. The ‘One’ refers to God: ‘There where He is in Himself, before He flows out into the Son and the Holy Spirit. . . . A master has said: the one is a negation of negation’ (Q, 252). The Godhead is the absolute unity of the divine being, the negation of all multiplicity, not only of the multiplicity of creatures but even of the multiplicity of Persons in the divine Trinity. The Godhead is the deeper ‘ground’ (*Grund*: Q, 264) from out of which even the Persons of the Trinity flow. But because this ground is ‘hidden’, it is just as much an ‘abyss’ (*Abgrund*: Q, 213).¹⁴

While Eckhart frequently vests his thought in the language of Aquinas, the direction his thought is taking is quite different. Indeed, he goes on to deny the central tenet of Thomas’s metaphysics, the primacy of *esse*. After accepting Aquinas’s arguments for the identity of being (*esse*) and understanding (*intelligere*) in God, he states in his *Parisian Questions* that he has reached a very unthomistic conclusion: ‘I am no longer of the opinion that He understands because He is, but that He is because He understands, so that God is intellect and the act of understanding, and the act of understanding is the ground of being itself’ (LW, V, 40).

There is something higher – or deeper – in God than ‘being’ and that is ‘understanding’. God is *not* being, formally speaking:

In God there is neither being (*ens*) nor the act-of-being (*esse*), because nothing is formally present in both the cause and that of which it is the cause, if the cause is a true cause. But God is the cause of all being. Therefore being is not formally present in God.

(*LW*, V, 45)

Eckhart attempts to reconcile this position with the one he adopted in the *Prologues* – that *esse est deus* – by arguing that being does not belong to God ‘formally’ but rather in a ‘higher’ sense. This is because God is ‘a true cause’, i.e., one which is of an essentially higher kind than its effect, in this case, creatures. Now creatures have ‘being’ properly speaking, for to be ‘created’ is to receive being. But God is the cause of the being of creatures. And since He is a ‘true’ or transcendent cause, He does not share ‘being’ with creatures in a ‘univocal’ sense (*LW*, V, 51). Thus God does not have being, properly speaking, but the ‘purity of being’ (*puritas essendi*: *LW*, V, 45).

But the purity of being is identified by Eckhart as understanding. For the understanding is *not* being, but that by which being is known. Ideas are not things but the means by which things are known. In order to know something, the soul, Eckhart says (following Aristotle), must be ‘pure’ of, ‘unmixed’ with, ‘separate’ from, that which it knows. If the eye were colored then it would see all things under that color. The understanding is separate from being and contains the form of every being in a pure way. God is the highest ‘separate substance’, the most removed of all from time and multiplicity, the absolute ‘purity of being.’ Hence God knows all beings and is not any particular being. His proper name is not being, therefore, but the purity of being, viz., understanding.

The ‘naked essence’ of God, the pure, simple, inner life of God, is the life of understanding, or, as Eckhart translates *intellectus* in his vernacular sermons, the life of ‘Reason’ (*Vernunft*):

If we take God in His being, then we take Him in His vestibule, for being is the vestibule in which He dwells. But where is He then in His temple, in which He shines forth as holy? *Reason* is the temple of God. God dwells nowhere more authentically than in His temple, in Reason. As that other master said, God is His Reason, which there lives in knowledge of Himself alone, abiding there only in Himself, where nothing ever troubles Him. For He is there alone in His stillness. In His knowledge of Himself, God knows Himself in Himself.

(*Q*, 197; cf. *Q*, ‘*Einleitung*’, 23)

By assigning such primacy to the understanding, Eckhart is defending the traditions of his order against the Franciscans who emphasized the divine will. Eckhart takes over the 'self-thinking thought' of Aristotle and contours it to the needs of his Christian metaphysics. As such, Eckhart's *Vernunft*, the life of God knowing Himself, provides a neglected link in the familiar connection between Aristotle and Hegel. When Hegel identifies the Absolute as the absolute 'Idea', he agrees with the Dominican-Aristotelian intellectualism of the Middle Ages, and with the German Eckhart in particular.

The activity of thought thinking itself is entirely self-contained, beginning and ending in the divine mind itself. Hence it is for Eckhart the supreme form of 'life'. With Aristotle, Eckhart held that a living thing is

that which is moved from itself as from an inner principle and in itself. But that which is not moved except by some external thing neither is nor is said to be living. From this it is evident that everything which has an efficient cause prior to and above itself, or a final cause outside of or other than itself, does not live in the proper sense. But such is the case with every creature. Only God as the ultimate end and first mover lives and is life.

(LW, III, 51)

God requires no efficient cause to set Him into activity, nor does He act for the sake of any end outside of Himself. He is the cause and principle of all things, but He requires no cause or principle for Himself. Hence Eckhart cites with approval Proposition VII of the *Liber XXIV Philosophorum*: 'God is the principle without principle, the process without variation, the end without end' (LW, III, 16, n. 1). The life of the self-thinking thought is self-sufficient, self-complete. The life of God, Eckhart says, is 'without why'. While it is the explanation (or 'why') of all other things, it itself stands in need of no explanation of its own being (LW, III, 41). Thus God created the world, not out of any lack in Himself which He hoped to fill up (a 'why'), but out of the welling up within Himself (*ebullitio*) of His own life which spills over into creatures. In an unusually rhapsodic passage for the Latin writings Eckhart says:¹⁵ 'Life means a certain overflow by which a thing, welling up within itself, first pours itself fully within itself, each part of itself in every other, before it pours itself out and wells over into something external' (LW, II, 22). While it would be an exaggeration to see in Eckhart the first process theory of God, it is true that he emphasized the living and active quality of the divine nature.¹⁶ He saw God as the process of life giving birth to life, a process which flows into the Trinity itself and then flows over into creatures.

The ground of the soul

The transition to Eckhart's mystical doctrine may be made by returning to the pivotal text, cited above, in which Eckhart spoke of the divine Reason. It continues: 'Now let us take it [knowledge] as it is in the soul, which possesses a trickle of Reason, a little spark, a twig' (*Q*, 197). Eckhart sets up a correlation between God and the soul. As God possesses a hidden ground which is Reason itself, so the soul possesses its own hidden ground, which is but a 'little spark' (*Fünklein*), a drop, a small share, of the divine Reason.¹⁷ In virtue of this divine spark, the soul alone among all creatures is able to penetrate to the hidden ground of the divine being. Because of its small share in the divine intellectuality, the soul is akin to God and able to unite with God: 'Intellect properly speaking belongs to God and "God is one"'. To the extent, therefore, that each thing possesses intellect or intellectual powers, to that extent it is one with God' (*LW*, IV, 269–70; e.t., 212). Because of their mutual intellectuality, there is an intimate and profound correspondence between the soul and God. As God's Reason is the hidden sanctuary of His Being, so the soul's spark of Reason is its inner temple (*Q*, 153). Here God and the soul unite: 'Here God's ground is my ground, and my ground is God's ground' (*Q*, 180).

When Eckhart speaks of the 'little spark' of Reason, it is important to realize that he is not referring to the faculty of discursive reasoning, the power which uses concepts and representations. In the vernacular sermon '*Impletum est*' he distinguishes three kinds of knowledge:

The one is sensible: the eye sees things, even at a distance, which are outside of itself. The second is rational and much higher. But with the third is meant a noble power of the soul, which is so high and noble that it grasps God in His own naked being. This power has nothing at all in common with anything else.

(*Q*, 210)

The first two powers are directed outwards to creatures, the first in terms of their sensible properties, the second in terms of their essential or intelligible properties. The second power, which Eckhart here calls 'rational', proceeds by means of concepts and representations (*Vorstellungen*: *Q*, 138; *Begriffe*, *Q*, 318; in Latin, *species*), which in the classical Aristotelian theory are signs of external things and are themselves symbolized by words. But of the third power, 'the ground of the soul', he says that it 'has nothing in common with anything'.¹⁸ It is not concerned with creatures, nor is it in any way like creatures; it is related solely to God, and to His 'naked Being' (the Godhead).

By means of its 'faculties' – sensation, will and (discursive) reason –

the soul is directed outwards to creatures. By the use of these faculties it performs 'outer works', not only of laboring and eating, say, but also of praying and fasting (*Q*, 76). The ground of the soul, the very 'being' (*Wesen*)¹⁹ of the soul, on the other hand, is prior to the emergence of the faculties and is the 'root' (*Wurzel*: *Q*, 318) of all outer works. Hence Eckhart says that one should be holy in one's being, not merely in one's work; if a man 'is' holy, his 'works' will be holy. We are not sanctified by our works, our works are sanctified by us. There is no 'activity', no commerce with creatures, in the ground of the soul because the ground of the soul is prior to the faculties by which one 'acts'. It was not in Aquinas but in the German Dominican tradition – in Albert the Great (d. 1280) and Dietrich of Vrieberg (d. 1310) – that Eckhart found the idea that the essence of the soul was a 'hidden recess of the mind' (*abditum mentis*).²⁰ In this innermost ground, the soul is still and silent (*Q*, 237–8) and ready for a union with God which is denied to the 'faculties', inasmuch as they are immersed in the daily business of life.

Stripped of all relationship to creatures, Eckhart invests the ground of the soul with all of those properties which he otherwise reserved for God. Like God, it is timeless, living in an eternal now, never 'growing old' (*Q*, 162). Similarly, it is 'one and simple' (*Q*, 164) because in it there is no distinction of faculties, no multiplicity of activities. Moreover, he says:

It is neither this nor that; despite this, it is something which is raised up above this and that like the heavens above the earth. Consequently, I name it now in a more noble way than I have ever named it. . . . It is free of all names and emptied of all forms, wholly simple and free as God in Himself is simple and free.

(*Q*, 163)

It has so little to do with anything created that it has no identifiable creaturely property. Like the Godhead itself, it is nameless.

There is thus a special correspondence, an exclusive reciprocity, between God and the soul. Only the ground of the soul is pure enough and simple enough to receive God; and only God is pure and simple enough to enter the ground of the soul (*Q*, 164, 252). 'God is nearer to the soul', he says with St. Augustine, 'than it is to itself.' And again: 'Where God is, there is the soul; where the soul is, there is God' (*Q*, 207). The soul is the place of God, as God is the place of the soul (*Q*, 213). The ground of the soul is a 'place' among creatures into which God may come, a place for God's advent into the world.

The birth of the son

The advent of God into the soul, the event that takes place in the soul, is described by Eckhart as the 'birth of the Son'. The place that the soul makes for God, he says, is God's 'birthplace' (*Q*, 415). Eckhart takes his point of departure for this doctrine from St. John and from this point on, whatever affinities Eckhart may have to Eastern mysticism,²¹ his position is distinctively Christian. He frequently cites the *First Letter* of St. John:²² 'Think of the love that the Father has lavished on us, by letting us be called God's children; and that is what we are' (I John 3: 1). For Eckhart John is to be taken at his word, and John says that we are not only 'called' God's children, but 'that is what we are'. This can only mean one thing: 'As little as a man can be wise without wisdom', he says, 'so little can he be a son without the filial being of the Son of God . . . ' (*Q*, 317). And even more strongly:

The Father bears His Son in eternity like to Himself. 'The Word was in God and the Word was God.' He was the same as God and of the same nature. Yet beyond this I say: He has begotten Him in my soul. . . . The Father bears His Son in the soul in the same way that He bears Him in eternity, not in any other way. He must do it, whether he wishes to or not. The Father bears His Son incessantly, and I say still more: He bears me as His Son, and as the same Son. (*Q*, 185)

The process by which the Father bears His Son in eternity is extended to the ground of the soul so that the Father bears His Son in the soul. Moreover, He bears the soul itself as that very Son. The Son is born in the place that the soul makes for Him and the soul is assimilated to that Son. The generation of the Son in eternity and the Incarnation of that Son as man is a universal event for Eckhart which is extended to the soul itself:²³ 'It would mean little to me that the "Word was made flesh" for man in Christ, granting that the latter is distinct from me, unless He also [was made flesh] in me personally, so that I too would become the Son of God' (*LW*, III, 101-2; cf. *Q*, 415).

Although Eckhart's formulations are in the strongest possible language, his position is essentially orthodox (Théry 199; 242-4; 266-8). For not only is there a doctrine of mystical union expressed in terms of divine sonship in the Johannine gospel,²⁴ but the notion that the Son is born in the soul has a long history in orthodox Christian theology before Eckhart.²⁵ In keeping with this tradition, Eckhart distinguishes between the Son by nature and the Son 'by grace' (*Q*, 119-20; 208). The Son by nature is the eternal Word Himself; the Son by grace is the ground of the soul which has been 'formed over' (*überbildet*: *Q*, 103) in the image

of the Son by reason of the residence which the Son takes up in the soul. Grace is the 'codwelling' of the soul and God together (*Q*, 398).

Eckhart elaborates the doctrine of the birth of the Son in two important ways: first, in terms of an 'image', and secondly, in terms of a 'word'. A father is one who generates his 'image' (*Bild*) or likeness. For an image, there are two requisites (*Q*, 224–6). First, there must be a likeness between the original model and the image. But while this is a necessary condition, it is not a sufficient one: 'There can be no image without likeness, but there can indeed be a likeness without an image. Two eggs are equally white, yet one is not the image of the other' (*Q*, 224). The second requirement is stronger, viz., that the image be sustained in its very being as an image by the model: 'An image takes its being immediately and solely from that of which it is an image' (*Q*, 226). The image of a face in the mirror, e.g., is not only like the face of which it is the image, but it also derives its being from the face, in the sense that the image persists only so long as the face is present; if the face were removed, the image would vanish. Now the relation of a son to his father fulfills both these requirements. Yet even here a distinction is to be made. A human father brings about the being of his likeness, his son, but because of the disunity between a human father and son – they are distinct and separate substances – the human son may continue to live after the father has died, thus impairing the perfection of the second requirement. The divine Father on the other hand is essentially a process of giving birth, the divine Son essentially a process of being born. The being of each is their relationship to one another. And since it is the same eternal birth process which is extended to the ground of the soul, the soul too is made in the authentic and true image of the Father. The soul is formed in the image of the Father (*überildet*) by the Father Himself.

For the Father to bear His Son is also, according to Eckhart, for Him to speak the eternal Word. According to medieval theology, the essence of the Second Person is to be the 'thought' in which the Father knows Himself. The 'Son' is the 'concept' or that which is 'conceived' by the Father. The Second Person is thus the 'Word' in the sense of a '*verbum cordis*', a silent inner word (or 'concept') of which the vocal word (*verbum vocis*) is the outer sign.²⁶ If the Father bears His Son in the soul precisely as He does in eternity, then He also 'speaks' His Word in the soul just as in eternity (*Q*, 236–8; 287). The Word has nothing to do with a spoken sound. Indeed it is even opposed to such. The Word which God speaks in the soul is 'hidden' and easily ignored. To hear what is spoken in silence, one must be silent oneself: 'All voices and sounds must be put away and a pure stillness must be there, a still silence' (*Q*, 237). And: 'In stillness and peace . . . there God speaks in the soul and expresses Himself fully in the soul' (*Q*, 238). The truest

word, the most perfect language, is silent. In the best tradition of negative theology, Eckhart denies the ability of human language to express the divine nature: 'What one says about God is not true; but what one does *not* express is true' (*Q*, 242-3). But not only 'voices and sounds' disrupt the silence that Eckhart has in mind, but all concepts, images and representations: 'The best and most noble thing of all which one can attain in this life is to remain silent and let God work and speak. Where all the powers have removed all their works and images, there is this Word spoken' (*Q*, 419-20). Nothing created is able to express the divine being. Not only spoken or written words, but even inner concepts are incapable of comprehending the simplicity and plenitude of God (*Q*, 242-3). The only 'concept' which adequately expresses the likeness of the Father is the uncreated 'Word' itself, which the Father speaks. All human language, interior and exterior, must be silenced in order to let the Father speak.

Detachment

While the birth of the Son in the soul is the work of God, it cannot be accomplished without the soul's assistance. So necessary is the soul's participation in this process, so intimately does it share in the Father's work, that Eckhart does not hesitate to say that the soul 'cobears' (*mitgebiert*: *Q*, 161) the Son, that it 'collaborates' (*mitwirkt*: *Q*, 94-5) with God. There is only one work, which the Father initiates and with which the soul cooperates.

The soul cooperates with God's action by the practice of 'detachment' (*Abgeschiedenheit*). Eckhart uses the word '*Abgeschieden*' to translate the Latin '*separatus*' (*DW*, V, 438-9, n. 1). The '*substantiae separatae*' (*die abgeschiedene Geiste*) are the substances which are 'separate' from matter and its conditions (angelic natures). Eckhart also uses '*Abgeschieden*' as a translation of '*abstractus*', that which is 'removed from' or 'drawn away from' matter and its conditions. The 'separate substances' are pure of matter and so purely intellectual beings. For insofar as a substance is removed from (*separatus*, *abstractus*) material qualities, it is able to acquire knowledge of these qualities. But God is removed not only from matter but from every form of particularity, and so God comprehends all being. God is *not* being, formally speaking, but intellect. God is the absolutely abstract or separate substance.

Because this is so with God, Eckhart puts the same demand upon the soul which would unite with God:

This immutable detachment brings man into the greatest likeness with God. For God is God because of His immutable detachment, and from detachment He has His purity and simplicity and unchangeability. Consequently, if a man should become like to God, insofar as a

creature can have likeness with God, then this must come about through detachment. . . . And you should know this: to be empty of all creatures is to be full of God; and to be full of all creatures is to be empty of God.

(DW, V, 541–2)

The soul must detach itself from all creatures, and so purify and simplify its being, just as God is pure and simple. But what does it mean for the soul to become 'detached'? Eckhart means neither that one should become physically separated from things by entering a monastery (Q, 59), nor that one should long for death and 'separation from the body', as the *Phaedo* counsels. Detachment is a matter of the 'heart' (DW, V, 539). The detached heart considers creatures to be 'nothing' (of themselves). It does not seek created goods, but desires only God Himself. Detachment means 'to be receptive of nothing other than God' (DW, V, 540), to desire nothing other than God, to serve no one but God. The detached heart has 'nothing to do with anything', with 'this or that', i.e., with any creature. Having thus purified its heart of any affection for created things, the soul takes on the 'separateness', the 'no-thingness', of God Himself and so becomes a receptacle fit for God alone: 'Only He [God] is so simple and subtle that He can be contained by the detached heart. Hence detachment is receptive of nothing other than God' (DW, V, 540). The unity of Eckhart's metaphysical and mystical thought of which the youthful Heidegger spoke (DS, 241) is nowhere more apparent. The *substantia separata* of the scholastic metaphysician becomes the 'detached heart' (*abgeschiedene Herz*) of the German mystic. The 'living' or 'existential' correlate of the metaphysics of *intelligere* is the mystical life of detachment.

Eckhart also discusses the way in which the soul readies itself for the birth of the Son in terms of what he calls '*Gelassenheit*', a notion which we take to be identical with 'detachment'. The root of the word, *lassen*, means to let go, to relinquish, to abandon. The soul in *Gelassenheit* abandons or relinquishes whatever would impede God's advent into the soul. But *lassen* also means to 'permit' or 'let'. Thus the soul which has abandoned the obstacles to the birth of the Son simultaneously lets or permits God to bear His Son in the ground of the soul. The first moment is negative – to be empty of creatures – the second is positive – to be full of God.

The principle of perversity in the soul and the greatest obstacle to its union with God is 'self-love' (*Eigenliebe*) or 'self-will' (*Eigenwille*):

People say: Ah, Lord, I would very much prefer that I stood as well with God and that I had as much devotion and peace in God as other

people have. And I would also prefer that things would go along for me in the same way [as with others] or that I too might be as poor.
(Q, 55)

Eckhart's diagnosis of such complaints is this: 'In truth, it is your "I" which is protruding. It is self-will and nothing else' (Q, 55); and his remedy: 'Consequently, begin first with yourself and abandon yourself [*lass dich*]!' (Q, 55). It is not so much what a man does that matters, but what he is. He should do nothing because it is his own will, even if as an outer work it is praiseworthy (giving alms, say), but only because it is God's will, even if it is less praiseworthy (earning money, e.g.).²⁷ If a man abandons everything but not himself, then he has abandoned nothing. But if he abandons himself, then he has abandoned all (Q, 36, 185). The 'resigned' (*gelassen*)²⁸ soul does not pray that God's will conform to its own – that it be given something it desires – for that is still self-will. Nor does the resigned soul even will that it itself should conform to the will of God. Rather it has no will at all of its own; it is entirely divested of willing (Q, 304).

Such a soul is completely at God's disposal; it is empty of creatures in order to be full of God: 'Where the creature ends, there God begins to be. Now God desires nothing more of you than that you go out of yourself according to your creaturely mode of being and let God be God in you' (Q, 180). The fully resigned soul is a pure and empty vessel into which God can be received. Like a good vessel, it is closed on the bottom – to creatures – and open on the top – to God (Q, 228). Like the power of seeing in Aristotle's *De anima* which is pure of all color, the soul is pure of everything created, and so it can receive God purely, precisely as He is in His 'unconcealed' (*unverhüllt*: Q, 147) being, and not inasmuch as He is the 'object' of human desire.

If the soul is fully divested of its own will and given over to God's, then Eckhart says it lives 'without why'. We have seen above that Eckhart uses this same expression – 'without why' – to describe God's being. A living thing is that which moves from within. This is preeminently true of God, who is the beginning of all things without Himself having a beginning (*principium sine principio*). God lives without why. The soul too in *Gelassenheit* takes on this same quality of life without why. Some men love God, Eckhart says rather pointedly, the way they love a cow – for its milk (Q, 227). But the soul in *Gelassenheit* is disinterested in itself. If a man loves God for the good that God can give him, then he does not love God but himself. 'Love has no why' (Q, 299). If a soul works for the sake of its own self-aggrandizement, of procuring external goods, then its works are not living but dead (Q, 268), for they are moved from without (Théry, 236–7). The soul must love God for no other reason (why) than God Himself. Then it will be like life itself: 'If one asks life

for a thousand years, "why do you live?" if it were able to answer it would say nothing other than "I live in order to live" ' (Q, 180). God – like life – needs nothing external to Himself in order to be justified. The soul which lives with such perfect abandonment, such uncalculating love, enjoys a freedom and spontaneity like to God's own. It works for the sake of working. One must drive the money changers from the temple of the soul, Eckhart says (Q, 154); the money changers are those who love God only for profit. They are spiritual mercenaries who serve God for wages. They have not learned that they are now sons, not servants (John 15: 14; Q, 186), God's friends, not His hirelings (Q, 154–5), free men, not slaves.

Eckhart often says that God 'needs' the truly detached soul in order to bear His Son there: 'It is God's nature that He give, and His being depends on the fact that He give to us, if we are submissive to Him. If we are not and we receive nothing, then we do Him violence and kill Him' (Q, 172). God appears to be under the same necessity of nature to bear His Son in the soul as He is in eternity:

The Father bears His Son in the eternal knowledge, and He bears Him as fully in the soul as He does in His own nature. And He bears Him in the soul as His own, and His being depends on the fact that He bear His Son in the soul, whether He wishes to or not.

(Q, 172)

The soul apparently provides a necessary complement, an indispensable medium, in which the divine life is completed and fulfilled.

But this is not really Eckhart's view. It is quite clear that the divine life is a self-contained and self-sufficient process. Even the process by which God creates is a 'welling over' and an overflow (*antequam effundat et ebulliat extra*: LW, II, 172), not an attempt to fill up a lack. Moreover the birth of God is the result of grace (*gratia*), which is a free giving, and not of the necessity of nature. Finally, even in the vernacular sermons, where Eckhart states his position in the most extreme manner, he eventually qualifies his assertions. Hence the passage in which he spoke of 'killing God' continues: 'If we are not able to do this in Him Himself, still we may do it in ourselves and as far as it concerns us' (Q, 172). The death of God in question turns out to be a death in and for the soul, not in God's own being. We are able to stop the flow of God's life into our souls. No Dominican master at Paris, and certainly not the author of the 'Prologues', would hold that anything of the perfection of *esse* could ever be lacking to God.

But what the German preacher did mean by this bold language is to be found in his defense (Théry, 241–2) of such texts as we have cited (Q, 172, 185). In the first place, he says, this is an 'emphatic expression,

commending God's goodness and love'. This is the assertion of a preacher who means to inspire the soul to the 'highest virtue' of detachment. Because Eckhart demanded a perfect abandonment – without why – to God, he found it necessary to assure his listeners of the goodness of God and of the fact that it belongs to the necessity of the divine nature to return love with love. Secondly, he wished to insist that it is the same Son which the Father bears in eternity and which the detached soul receives by grace. It is the same necessary process of filiation which occurs in eternity which is extended – by grace – to the soul which has prepared itself for it. The soul comes to be by grace the self-same thing which God is by the necessity of His nature.

Whatever Eckhart's own intentions may have been, his expressions have fathered a long tradition of the divine 'need' of man in the German tradition. Among the mystics, God's need of man is found in Jacob Boehme and in the mystical poet 'Angelus Silesius' (Johann Scheffler: 1634–77), in whose *The Cherubic Wanderer* it receives its classic expression:²⁹

God Does Not Live Without Me

I know that God cannot live an instant without me;
Were I to become nothing. He must give up the ghost.

One Sustains the Other

God is as much set in me as I am in Him;
I assist His essence and He preserves mine.

In the philosophical tradition, God's need of man certainly recalls the nineteenth-century Idealists. Where Eckhart says that the 'highest striving of God' (*Gottes höchstes Streben*: Q, 208) is to bear the Son in the soul, Fichte's absolute Ego will also be a process of striving (*Streben*), not for the birth of the Son in man, but for the achievement of moral order in and through him.³⁰ And perhaps the most important representative of all is Hegel himself, for whom the Absolute is estranged from itself until it attains self knowledge in and through speculative thought.³¹

Part two

III Heidegger and Eckhart

Space does not permit us to pursue Eckhart's thought in any greater detail. We must instead turn to Heidegger and develop the striking parallel of the latter's thought to that of the mystic of Hochheim.

Dasein and the ground of the soul

Both Eckhart and Heidegger reject any merely 'anthropological' account of the essence of man. Neither is content to say that man is one being among others, differentiated by his 'rational faculty'. Man must be understood instead in relationship to something which transcends beings altogether. The essential 'greatness' of man is nothing human or anthropological, but rests in his being the privileged 'place' (*Stätte*: *Q*, 213; *Ortschaft*: *HB*, 77) in which the 'transcendent' comes to pass.³² Hence neither Eckhart nor Heidegger speak of 'man', but of the 'ground of the soul' or the 'Dasein' in man. And as the ground of the soul is the sanctuary or temple of God, so for Heidegger Dasein is the place which is needed by and used for the Truth of Being. Heidegger as much as draws this analogy of his thought to Eckhart for us himself. Referring to a text from the *Talks of Instruction* (*Q*, 57) in which Eckhart distinguishes those who are great in their 'being' from those whose 'outer works' alone are great, Heidegger comments: 'Let us consider that the great being [*Wesen*] of man is that it belongs to the essence [*Wesen*] of Being and is used by the latter to preserve [*wahren*] the essence of Being in its Truth [*Wahrheit*]' (*K*, 39).

Let us take a closer look at this comparison. Dasein is not a term for anything psychological; it is not a 'faculty' of the 'mind', nor is it 'consciousness'. It is the process by which a 'world', and the things that are in the world, become manifest. Dasein is the ecstatic relationship of openness to Being in which and through which Being reveals itself. Dasein comes to pass 'in' man, but it is not equatable with man. For man is a being, and Dasein is the process by which beings come to be manifest.

But Eckhart makes a comparable claim about the ground of the soul. For the highest power of the soul is so noble, he says, as to be nameless. 'This power has nothing in common with anything else' (*Q*, 210). It is neither 'this nor that'. It is not a faculty of the soul, but prior to all faculties. It is not identifiable with anything at all, anthropological or otherwise. It is not a being, just the way Dasein is not an existent entity (*ein Seiendes*), but a place within entities wherein God reveals Himself

in His 'naked Being'. The ground of the soul is not man's 'specific difference'. That is why we have underlined the importance of Heidegger's characterization of the enlivening attitude of medieval mysticism as 'the transcendent and primordial relationship of the soul to God' (*DS*, 1). For Heidegger has taken over this same *structure* in his own mature philosophical writings: the structure of a relationship to the transcendent which comes about in man, but is not identifiable with anything 'human'.

By its 'faculties', Eckhart held, the soul performed outer works and concerned itself with created things, thus running the risk of entirely forgetting the 'hidden ground' which is deeper than all faculties. Heidegger too warns of the danger of becoming so preoccupied with the business of everydayness as to forget the question of the meaning of Being. In the later Heidegger, 'fallen' Dasein is so devoted to the challenge of mastering and manipulating things that it is unmindful of the deeper Truth of Being which technology conceals. Both Eckhart and Heidegger describe a comparable 'fallenness' into everyday existence, and both interpret it as a forgetfulness of a silent, hidden ground in which the everyday is transcended.

Moreover, neither Eckhart nor Heidegger claim that there is anything contemptible about the 'outer' man, but only that it is something 'derivative', resting on deeper grounds. For Eckhart, the ground of the soul is not the opposite of its faculties, but the root out of which they flow. Eckhart does not repudiate the Aristotelian definition of man as the rational animal; he simply denies that the entire essence of man is thereby circumscribed. By the same token Heidegger holds that it is in virtue of its relationship to Being that all of Dasein's relationships with beings are made possible (*WG*, 13; *WW*, 20). The way in which Dasein comprehends Being filters down into the way in which beings are understood (*SZ*, §3). Like Eckhart, Heidegger is prepared to admit that the definition of man as the 'rational animal' is not 'false' (*HB*, 74-5) as far as representational thinking is concerned. His complaint is only that there is a realm beyond representational thinking, which alone can provide the most adequate interpretation of the Being of man (*HB*, 67-8).

Finally, Dasein and the ground of the soul are each related to the transcendent in terms of 'identity'. Both God and the soul, Being and Dasein, 'belong together' and find in each other their 'proper element'. Eckhart repeatedly says that the soul and God are 'one' in the sense that each alone is simple and pure enough as to be able to unite with the other. There is in Heidegger a comparable insistence on the togetherness of Being and Dasein. Being and Dasein are not two beings which are related to one another, but two poles of a pure relationship. All one may really speak of is the process by which Truth comes to pass: Being emerging out of concealment into un-concealment in its 'there' (*HB*, 69) and Dasein letting Being be in its Truth. This is, according to Heidegger,

the hidden truth of the *Satz der Identität*, of the 'leap' (*Satz*) out of representational thinking into the 'belonging together' (*Identität*) of Being and man (*ID*, 20–5). This reciprocity of Being and Dasein is clearly reminiscent of the intimate relationship of the soul and God in Meister Eckhart.

Birth and event

According to Meister Eckhart, the ground of the soul provides the place in which the event of the 'birth of the Son' occurs. According to Heidegger, Dasein provides a 'clearing' in which the 'Event of Appropriation' (*Ereignis*),³³ the Event of Truth, comes to pass.

In order to explain what he means by this Event, Heidegger employs a structure very much like that used by Eckhart in his account of the birth of the Son, viz., a 'relation'. For Eckhart, the being of the Father is to bear and that of the Son is to be born, and this unique situation, found only in the Trinity, in which a relation is not an accidental feature superadded to a substance but the very substance of the beings themselves, is called by the medievals a 'subsistent relationship'. And since the birth of the Son is an extension of the inner life of the Trinity to the soul, Eckhart adopted this same vocabulary in speaking of the relation of the soul and God. The relation of Being and Dasein is of the same sort, because for Heidegger Being 'is' (*west*) the very process of coming to pass in Dasein, and Dasein 'is' the very process of letting Being reveal itself. The 'Being' (*Wesen*) of each is their relationship to one another. Hence Heidegger might well have spoken of something like a 'subsistent relationship' between Being and Dasein. In fact one does find a comparable expression in his works. In his lecture on 'The thing' he speaks of 'mortals' (*Dasein*) as '*das wesende Verhältnis zum Sein als Sein*' (VA, 177). *Wesen* of course is taken verbally and so the phrase means: 'the relation to Being [*Sein*] whose being [*Wesen*] is to be [*wesen* taken as an infinitive] a relation.' Or using Adamczewski's translation of *Wesen* as 'way to be',³⁴ the phrase means: 'the relationship to Being whose way to be is to be related.' However it is translated, Heidegger means that the very Being of Dasein is its relationship to Being. Now the Event of Appropriation is the event of the 'mutual relation' of Being and Dasein, in which both Being and Dasein come into their 'own', that is, in which Being is provided with a place of disclosure and by which Dasein is opened to the truth of Being.

Moreover, the 'relation' of Dasein to Being even fulfills Eckhart's requirements for the relation of an 'image' to its original exemplar. We recall that it was not sufficient for the Son to be 'like' the Father in order to be His 'image' but it was also necessary that He be sustained in His very being as an image by the Father. Now Heidegger's account

of the relationship of Being and Dasein conforms remarkably to what Eckhart demands of a 'true image' and relation:

But how is Being related to ek-sistence, provided that we may so rashly ask this question at all? Being itself is the relationship [*Verhältnis*] insofar as it [=Being] holds [*halt*] ek-sistence [*Ek-sistenz*] in its existential, i.e., ex-static essence [*Wesen*] in itself and gathers it [=*Eksistenz*] to itself as the dwelling place of the truth of Being in the midst of beings.

(HB, 77)

Heidegger here (and elsewhere: WD, 1-2) plays on the root *halten* in the word *Verhältnis*. Dasein is 'held' in its relationship to Being by Being itself. And in a sentence which could very well have been written by Meister Eckhart, Heidegger says, 'A relationship to something would be a true relationship if it [=x] is held in its [x's] own essence by that [=y] to which it is related' (G, 50). This meets Eckhart's requirement for a 'true image' exactly. The relationship of Dasein to Being is not the 'doing' of Dasein but of Being. Being itself brings Dasein into relationship with itself, and sustains that relation. What Heidegger means by this may be seen by contrasting this position, found in the later works, with the one that he holds in *Being and Time*. The author of *Being and Time* spoke of the necessity for Dasein to raise the question of Being anew, radically to interrogate Being. Even as late as 1935 Heidegger spoke of questioning Being as a matter of 'resolving', of 'willing to know' (EM, 16). But it seems to have been one of the decisive realizations of the later Heidegger that Being does not submit to human interrogation, that Being is not the 'answer' to a 'question' (SD, 20-1), but that it is rather a 'gift', a 'favor' (*Gunst*: WM, 49) which is bestowed upon man. If Being is grasped at all, it is because Being reveals itself on its own initiative to Dasein, although of course man must be open to this revelation. But man himself cannot bring about this revelation of Being. This is exactly as with Eckhart. It is the Father Who bears His Son in the soul, although the soul's cooperation is indispensable.

Eckhart also formulated the doctrine of the divine birth in terms of the 'eternal Word': for the Father to bear the Son in the soul is to speak His Word (*conceptum*, *verbum*) in the soul. For Heidegger too, the Event of Truth can be expressed in terms of a primordial language. In the Event of Language, Being comes to pass in the word and man is brought into his proper essence by means of this authentic discourse (US, 30, 258-9). Like Eckhart, Heidegger holds that this language is something over and beyond human talk, that it is a more original language which is nothing human at all. It is instead, according to Heidegger, the primal address of Being itself. It is not man who speaks, he

says, but Language itself (*die Sprache spricht: US*, 12). This seems to mean that the impulse to speak can on certain occasions originate in Being itself, so that, in this sense, Being speaks 'through' man. Like Eckhart, too, Heidegger characterizes this primal language in terms of silence. Because the original speaking of Language itself is quiet (*US*, 30, 262–3), it is only heard in silence and listening (*US*, 252–4). The most authentic talk is reticence and reluctance to speak. Moreover, this 'silence' to which both Eckhart and Heidegger refer is not only external but also involves the cessation of all images and concepts. In sum, as for Eckhart the most authentic speaking consists in letting the Father speak His Word in the soul, so for Heidegger the most authentic discourse consists in letting Being come to words in language.

One cannot overlook, however, the criticism which Heidegger voices of the 'theological' interpretation of language (*US*, 14–15), in which Eckhart's views seem to be included. For even though theology attributes a divine origin to language, Heidegger says, basing this view upon the opening sentence of St. John's Prologue (exactly as Eckhart does), it nonetheless remains within the traditional metaphysical understanding of language. Theology still adheres to the traditional distinction between the 'inner concept' and the 'outer word', taking the latter to be the externalization of the former. With the tradition, theology holds that the inner concept is the 'truer' language, but it insists that the truest concept of all is nothing created, but the uncreated Word itself. For Heidegger on the other hand this whole framework is faulty, for words are not to be understood as signs of concepts, and concepts as signs of things (*US*, 243ff.). Rather the 'thing' comes to be, i.e., to 'appear', in the first place, only through language (*US*, 232–3, 193–4). Language lets things be; it is the 'condition' (*Be-ding-ung*) of things. What Heidegger calls for is a language tempered by silence, free of 'conceptual' or 'representational' thinking, and which overcomes the distortions of all metaphysical language. Hence while Eckhart praises mystical silence, Heidegger calls for a renewal of language, a renewal which he thinks is to be found in the poets. While in Eckhart we meet a classic representative of the *theologia negativa*, in Heidegger we find a thinking which is to be conducted in proximity to the poets, but which nevertheless retains in a 'secular' way something of the flavor of negative theology.³⁵

Gelassenheit

While the birth of the Son in the soul is the work of God, there is a sense in which it is the soul's work also, inasmuch as it cannot be accomplished without the soul's cooperation, without its 'detachment' and 'resignation'. The self-disclosure of Being in Dasein is the 'work' of Being, but it cannot be accomplished without Dasein's cooperation. Speaking of the 'thing' in which the fourfold intersects, Heidegger says,

'When and how do things come about as things? They do not come about *through* the machinations of men. But they also do not come about *without* the watchfulness of the mortals' (VA, 180). Just as for Eckhart the soul must utter its *fiat*, so Heidegger's Dasein must open itself to the workings of the Event. The proximity of Heidegger to Eckhart in this matter is so great that Heidegger can find no better word to describe the posture of Dasein than Eckhart's own: *Gelassenheit* ('releasement').³⁶

To be sure, Heidegger immediately points out the difference between his use of the word and Eckhart's: 'But what we call releasement obviously does not mean casting off sinful self-seeking and getting rid of self-will in favor of the divine will' (G, 36). For Eckhart the soul which had not attained resignation was full of 'self-love' (*Eigenliebe*) and 'self-will' (*Eigenwille*). Heidegger is not interested in the problem of 'self-love', but of what he calls 'subject-ness' (*Subjectität*: HW, 236). Heidegger singles out a perversion which, while distinct from that described by Eckhart, is clearly analogous to it. The perversion is not 'sinful self-seeking' but setting up the thinking subject as the highest principle of Being and subordinating everything to the dictates and demands of the thinking subject. On this point at least, Heidegger has no quarrel with the common understanding of the history of modern philosophy: it begins with the discovery of the *ego cogito* by Descartes and it is consummated by the absolutizing of the ego in Hegel.³⁷ This is a perversion which entirely inverts the essence of man (N II, 366); for it refuses to acknowledge the priority of Being and sets up the priority of a being, man, in its stead (a failing quite analogous to the spiritual error of 'pride', in which man – the creature – sets himself before God – the Creator).

With Descartes the being is reduced to an 'object' presented to a subject. Leibniz leads this to its ultimate consequence by formulating the 'principle of rendering a sufficient reason'. With this principle human reason lays down the rules by which Being must abide: no being can be unless a sufficient reason is rendered to the thinking subject (SG, 31–75). There is no question of 'sin' here, but there is the same ring of perverted self-importance. Rational thinking is 'attached' to its own concepts (*Vorstellungen*) and rules (*Grundsätze*) to which it expects Being to conform. The history of metaphysics is the history of reason's prescriptions about what Being must be – idea, substance, spirit, matter, will, etc. (ID, 64). But for Heidegger, Being is 'the Overwhelming' (*das Überwältigende*: EM, 115) and man is but a 'mortal' cast forth by the 'throw' of Being (HB, 71, 75, 84).

If the Dasein of *Being and Time* was characterized by self-sufficiency and self-possession (*Eigentlichkeit*), the Dasein of the later works is described in almost opposite categories.³⁸ Man is not the 'lord' of the earth, of 'beings', but the 'shepherd' of Being. The virtues of the shepherd are his watchfulness, his patient waiting, and of course his

poverty and humility (*WM*, 49; *HB*, 90). The 'poverty' of Dasein is that it has no power of disposal over Being, that it depends upon Being's 'favor', if truth is ever to come to pass. It has 'divested' itself of its rational presuppositions about what Being must be. But like Eckhart, indeed like the Sermon on the Mount itself, Heidegger ascribes the greatest 'worth' (*Würde*: *HB*, 90) to the 'poor' in spirit, because it is through Dasein's poverty that the truth of Being itself is preserved. The fault of the metaphysics of 'subjectness' is, therefore, not that it assigns too much to man, but that it assigns him too little. For it does not see man as the place of the preservation of the Truth of Being (*HB*, 66). The true worth of Dasein is that, by releasing itself from its rational presuppositions, it 'admits' (*einlasst*) itself into the Open in which Being reveals itself (*WW*, 14–15).

Like Eckhart, Heidegger distinguishes two 'moments' of releasement, a negative and a positive. Where Eckhart said that the soul must be 'empty of creatures', Heidegger speaks of the necessity of 'being loosened' (*Losgelassenheit*: *G*, 51) from beings and the thinking concerned with beings ('representational', 'calculative' or 'transcendental-horizonal' thinking). Indeed, in *What is Metaphysics?* Heidegger very nearly adopts the word *Abgeschiedenheit* to describe this moment of releasement, speaking of the need for a 'separation from beings' (*der Abschied vom Seienden*: *WM*, 49) in order to attain the 'favor' of Being itself. In Eckhart this negative phase of detachment implied a discipline of freeing the soul from the love of creatures. In Heidegger, too, there are the same overtones of asceticism and self-discipline. The 'separation from beings', he says, is the 'sacrifice', i.e., the surrender of the powers of calculation for the sake of a higher truth. It is this ascesis which enables Heidegger to insist that his thought is not 'arbitrary' but 'strict' (in keeping with Husserl's determination of the nature of phenomenology). Although it does not have the 'exactness' of mathematics, the thinking concerned with Being (*Seinsdenken*) is strict and 'disciplined', because it must strenuously resist the inclination to 'rationalize' Being, to 'explain' it in terms of cause and effect, to reduce it to the highest being and first cause. Strict thinking must stay purely in the element of Being itself (*HB*, 56).

But there is a second, positive moment of releasement. Just as for Eckhart detachment meant not only to be 'empty of creatures' but also to be 'full of God', so releasement means not only to be 'loosened from beings' but also to be 'open to Being' (*G*, 25–6, 51). The first moment is negative, a willing not to will, not to 'represent'. It is active and ascetic. The second moment attains the perfection of releasement. Here there is no question of willing of any kind, but a simple openness to Being which 'lets' Being be, just as Eckhart spoke of letting 'God be God' (*Q*, 180). And as to the resigned soul the unconcealed and truly

divine God is revealed, so in Heidegger Being discloses itself in its truth, free of all metaphysical disguises, to the thinking which is released.

We are now in a position to clarify a criticism which Heidegger makes of Eckhart's view of *Gelassenheit*: 'Releasement can still be thought within the realm of willing, as happens in the old masters of thinking, e.g., in Meister Eckhart' (G, 35–6). Now if Heidegger means by remaining 'within the realm of willing' that Eckhart holds that *Gelassenheit* is a will to not will, then he is clearly mistaken. For both thinkers maintain that this is but a preliminary phase of *Gelassenheit*, and that the perfection of *Gelassenheit* is the suspension of willing altogether. This is a point on which Heidegger and Eckhart are in complete agreement. It is more likely that Heidegger means that Eckhart remains within the realm of willing insofar as Eckhart recommends that we be released into another, higher will. Heidegger's criticism amounts to the accusation that Eckhart remains within the history of metaphysics because he has replaced Being itself with a being, the will of the highest being. This is a point of great importance and we will have occasion to return to it in our concluding remarks below (IV).

The proximity of Heidegger to Eckhart on the question of releasement is manifested in another way. We recall that Eckhart said the fully resigned soul should live 'without why', i.e., with a disinterested love of God. This same phrase – *ohne Warum* – reappears in Heidegger's *Der Satz vom Grund*. The reason for this is that Heidegger is commenting upon a couplet from Silesius's *Cherubinic Wanderer* which bears that same inscription:

Without Why

The rose is without why; it blossoms because it blossoms;
It cares not for itself, nor does it ask if it is seen.

(CW, I, No. 289)

Silesius's poem draws upon an anthology of mystical writings composed by the Jesuit Sandaeus, in which Eckhart and his disciples Suso and Tauler are amply represented.³⁹ Silesius, the contemporary of Leibniz, offers an apparent exception to the 'Principle of sufficient reason', according to Heidegger: something – the rose – is without a 'reason', a 'why'. But the poet has no interest in denying the Principle. He says that the rose is without 'why' – not without 'because' (*weil*). 'Because' supplies the 'ground', whereas 'why' only seeks after it. The rose is not without a ground. Leibniz's principle is true *of* the rose, but not *for* the rose, says Heidegger (SG, 73). The rose does not *seek* the ground of its blossoming. It does not interrogate the origin and outcome of its blossoming, but is content with the simple activity of blossoming. The rose illustrates the same point which Eckhart makes when he says that the

soul which lives 'without why' is like life itself. Life does not need an explanation and a rationale for itself. Life is not desired *for* something other than itself but *because* it is life: life is without why; it lives because it lives (Q, 180).

In the way that Eckhart said the life 'without why' befitted both God and the soul, so Heidegger sees in the rose a twofold model. In the first place, the rose is like Being itself (SG, 188). Like the rose, Being is the simple process of emerging out of itself:

The blossoming is grounded in itself, has its ground by and in itself.
The blossoming is a pure rising forth from out of itself. . . .

(SG, 101–2; cf. p. 73)

Hence the rose represents Being as *physis* (SG, 102): the emergent-enduring-power (*aufgehend-verweilend-Walten*: EM, 3). The language of Heidegger in this matter is very close to Eckhart's talk of the 'life' of God as the process of 'welling up' within Himself and then overflowing first into the other Persons of the Trinity and finally into creation itself. Heidegger's *physis* and Eckhart's 'life' are akin: each is a process of rising up out of an inner recess into manifestness (self-emergence); and each is a 'self-sufficient' process in the sense that it rises up *because* it rises up, needing no outward impulse or motivation. The blossoming of the rose is equally a model for each.

But the rose has a further role to play for Heidegger: 'What is unsaid in the verse, and everything depends on this, is rather that man, in the most concealed ground of his being [*Wesen*], never truly is until he is in his way like the rose – without why' (SG, 72–3). Thus the rose is also a model for Dasein (just as it was a model for the soul in Silesius's poem). Dasein must be 'without why' inasmuch as it must suspend all rational interrogation of Being.⁴⁰ The thinking concerned with Being does not demand that a 'reason' be 'rendered' for Being. Being 'is' (*west*) *because* it is. Being is the ground of beings, but there is no ground for Being itself. Hence it is just as much an 'abyss' (*Abgrund*). Being is the final 'because' for every question. With Being itself Dasein must surrender its search for further explanation: 'The because is swallowed up in a play. The play is without why. It plays as long as it plays. There remains only play: the highest and the deepest' (SG, 188). Being is an inexorable 'because', and all that Dasein can do is 'let' Being be, free of reason's categories and 'first principles'. But that is the essence of releasement.

There is one last point to be made in connection with the notion of *Gelassenheit* in Heidegger and Eckhart. Eckhart, we noted above, unwittingly fathered a long tradition of God's 'need' of man in German thought. Now the relation of Dasein to Being which Heidegger expresses

in the word '*brauchen*' seems to stand in the shadows of that tradition. Ordinarily, *brauchen* means 'to need' or 'to use'. But for Heidegger it does not precisely signify either of these. Being does not 'use' Dasein insofar as this implies 'utilizing' (*Benutzen*: WD, 114). To 'utilize' something is to subordinate it to the user, to make of it a mere instrument, like the hammer. Dasein is no 'tool' for the 'cunning' of Being. Nor should we think *brauchen* in terms of 'needing'. For it is not appropriate to imagine that Being – Truth itself – is dependent upon man (*G*, 64–5). This is to fall back into the error of Cartesian subjectivism. Nor is Being's relationship to Dasein one of 'necessitating' (*Benötigen*: WD, 115) it, for the 'sacrifice' of Dasein to Being must be free (*WM*, 49), just as Mary's fiat was free.

If Being does not utilize or need or necessitate Dasein, just what does *brauchen* mean? Heidegger answers that 'only proper use [*Brauchen*] brings what is used into its essence [*Wesen*] and holds it there. . . . To use something is to let it enter into its essence, to preserve it in its essence' (WD, 114; e.t., 189). *Brauchen* must be understood in the light of the fact that Being and Dasein belong together, that each complements and provides the proper element for the other. Each 'helps' (*hilft*: WM, 50) the other into the fullness of its being (*Wesen*). Without Dasein there is no clearing in which the Event of Truth may occur. Yet Dasein does not determine how the Event will come out, which is the sense in which Truth is independent of Dasein. *Brauchen* means something like 'assisting' or 'helping' rather the way God and the soul 'help' and preserve one another in the *Cherubinic Wanderer* (CW, I, No. 100). That is why Heidegger says that *Es brauchet* is to be thought in conjunction with *Es gibt*.⁴¹ The 'It' which 'gives' is the same as the 'It' which 'uses', and the It which gives is the Event itself (*SD*, 20). But the Event comes to pass as an appropriation process: it 'bestows' upon Dasein its proper essence and, in so doing, the Event, too, comes about in a manner which is 'appropriate' to itself. This mutual self-appropriating is the giving of the 'It gives' and the using of 'It uses'. And while this position is not Eckhart's, it belongs to a philosophical and mystical tradition of which Eckhart is, willingly or not, the forefather.

Being and beings

The last major theme in the writings of Meister Eckhart to which the work of Heidegger invites comparison is the relationship between God and creatures. The analogue in Heidegger's thought is the relationship between Being and beings. Thus our original proportionality may be expanded:

God : soul : creatures :: Being : Dasein : beings.

Eckhart insisted, as we saw above, on the radical dependency of the

creature upon God. Creatures have being the way the air has light. This position is not pantheistic, as the best modern scholarship points out;⁴² but it does stress the intimacy and proximity of God and creatures. Creatures are 'immediately touched' and 'penetrated' by God, the way the air is totally filled by the light of the sun (*LW*, I, 173). The upshot of this is not that one should take flight from this world in order to find God but, on the contrary, since creatures are filled with God, that one should learn to find God in creatures. If God is concealed to a man by created things, the trouble is not with things but with the man (*Q*, 55). One must learn to seize God in creatures: 'A man does not learn this [finding God] through flight while running from things and turning oneself into a solitude of an outward kind. He must rather learn an inner solitude, wherever and with whomever he may be. He must learn to break through things and to seize God in them and to hold His image steadfastly in himself in an essential way' (*Q*, 61). Creatures are nothing in themselves. Consequently, one must not take them 'in themselves' but 'in God' (*Q*, 379). One must not avoid creatures but must be related to them in the right way. To take creatures in themselves is self-love and attachment; but to regard them with a detached heart is to see them in God and to see God in them.

In Heidegger there is a comparable proximity between Being and beings. Being is always the Being of beings (*WG*, 15). Being 'never is' (*nie west*) without beings (*WM*, 46).⁴³ And as there was with Eckhart, so there is in Heidegger an error which consists in taking beings apart from Being, in occupying oneself with beings and forgetting Being. The error is not 'worldliness' (cf. *WG*, 24–6) but 'metaphysics': 'Insofar as it always represents beings as beings [*das Seiende als das Seiende*], metaphysics never thinks upon Being itself' (*WM*, 8). Metaphysics falls short of Being itself because it invariably 'represents' Being in terms of a being – the highest being (*God*), the thinking being (the subject), and so on. And as Eckhart warned that the desire for creatures was a desire for nothing (*Q*, 171), so Heidegger regards the present age, in which metaphysics has run its course to completion (*SD*, 61ff.), the age of technology (*Technik*), as one of 'nihilism'. Nihilism, according to Heidegger, is the age in which Being has become a vapor, a vacuous abstraction (*EM*, 27–9), 'nothing at all' (*N I*, 338). The phenomenon of 'fallenness' described by the author of *Being and Time* now consists in thinking what is 'given' while forgetting the 'It' which 'gives' (*SD*, 8), just as for Eckhart the worldly heart is concerned with creatures to the neglect of the Creator.

But just as Eckhart does not recommend that the soul leave the world to find God, so Heidegger thinks it only 'foolishness' to suggest that we do away with technology. We are not interested in 'some kind of renaissance of preSocratic philosophy', he says. This would be 'idle and

foolish' (*WM*, 11). Nor does he wish to relinquish the use of technological tools:

The equipment, apparatus and machines of the technological world are for all of us today indispensable, for some to a greater extent, for others to a less extent. It would be foolish blindly to assail the technological world. It would be shortsighted to wish to condemn the technological world as the work of the devil.

(*G*, 24; cf. *ID*, 33; *K*, 24–5)

But neither does Heidegger make the by now familiar suggestion that it is not technology which is evil but the use to which it is put, that technology is 'neutral' and that we must learn to master it, instead of letting it master us (*K*, 5). Technology is not neutral because it is a 'mission of Being' (*Seinsgeschick*) in which Being remains concealed. Technology is a name for the epoch of Being in which the illusion is perpetrated that Being is nothing more than a 'store of energy' which awaits man's use (*K*, 26), and that logico-mathematical thinking is the uniquely valid kind of thought (*G*, 26). This is nothing neutral, but a concealment of Being. The real problem that technology presents, according to Heidegger, is the distortion it makes in the essence of Truth and therefore in the essence of man (*VA*, 164). The problem is not with 'machines and equipment'. This is very much like Eckhart's diagnosis of the disconsolate soul: the trouble is not with peoples or places but with 'you yourself' (*Q*, 55).

Eckhart advised the soul not to leave the world but to change its attitude towards it. Correspondingly, Heidegger tells us not to do away with technology, but to learn how to gain a new ground and foundation in it (*G*, 26). Man cannot change the course that Being takes in history – the way the soul cannot change the will of God. Hence man must learn to think the present historical situation in terms of the 'mission of Being' – the way the soul must learn to view everything in terms of the will of God. Heidegger describes the new attitude that *Dasein* must have in the technological world as follows:

We are able to use technological objects and yet with suitable use keep ourselves so free of them that we are able to let go of them at any time. We are able to make use of technological objects as they ought to be used. But we are also able simultaneously to let them alone as something which does not concern what is innermost in us and proper to us.

(*G*, 24)

The new attitude – which of course is 'releasement' – says 'yes' to the

utilization of technological equipment, but 'no' to the distortion it makes of the essence of truth. Viewing technology as a mission of Being itself, this attitude is alert to a truth which technology conceals: 'The meaning of the technological world is concealed' (G, 26). And releasement stays open to this hidden meaning: 'I call the posture in virtue of which we hold ourselves open for the concealed meaning of the technological world: openness towards the Mystery' (G, 26). One must not think upon technology technologically but in terms of the mission of Being. And in this light technology appears as a derivative and 'untrue' form of a more primordial '*technē*' (K, 34) which is to be found among the early Greeks (VA, 160). As the soul finds God in all places and people and things, so meditative thinking finds even in modern technology the traces of a pristine disclosure of the Event of Truth. For the 'thinking which thinks in terms of Being as mission' (*Seinsgeschickliche Denken: N II*, 335), technology is a withdrawal of a primordial truth.

Original *technē* is a making which does not exploit 'nature' but which is accomplished in harmony with it. Hence it does not conceal the truth of nature but it reveals it. Original *technē*, says Heidegger, brings about the 'truth' in 'things'. The 'things' of original *technē* are the subject of some of the later Heidegger's most interesting accounts, accounts which are at once 'phenomenological' in the sense of *Being and Time* (hence in the sense of a phenomenology of the *Lebenswelt*), and yet profoundly in accord with the later *Seinsdenken*. We recall the bridge in 'Building, dwelling and thinking' (VA, 145ff.), the 'jug' in 'The thing' (VA, 153). The jug, e.g., unites the earth out of which it is made, the heavens whose rains it collects and contains, the gods to whom it can present a wine offering, and mortals whose thirst it satisfies. In the jug the 'four-fold' of earth and heavens, mortals and gods, which represent to Heidegger an original and truer state of things, one which has all but been forgotten, is collected together and brought to appearance (VA, 170-2). With such making there can be a proper dwelling (*Wohnen*) in the world (VA, 159). The world becomes again a place in which man is born and ages and dies, in which he works and rests and prays, in which he discovers the sense of 'being human'.

Hence, as the soul for Eckhart is at peace with the world and no longer disturbed by its dangers, so Dasein is reconciled with technology (G, 25), while it nourishes the hope of another day (K, 31) in which technology is assigned its proper place and is no longer taken to be 'something absolute' (G, 25).

IV The import of the analogy

The analogy that Heidegger's thought presents to Meister Eckhart is unmistakable. We must now turn to the implications that this analogy holds for our understanding of Heidegger. The proximity of Heidegger to Eckhart might very well represent to some a basis for writing Heidegger's work off as 'true philosophy'. To others it might show that he belongs to a long tradition of 'deep thinkers'. We shall steer a middle course between these predispositions by raising three simple and straightforward questions. In the first place, the parallel of Heidegger to Eckhart raises anew the entire problem of 'humanism' in the later Heidegger, for it is characteristic of mysticism to allow man to be swallowed up in a 'mystical self-effacement'. What does this analogy suggest, then, about the loss or the preservation of the humanity of man in the later Heidegger? Secondly, to what extent are Eckhart and Heidegger saying anything different from one another? Heidegger might very well have 'overcome metaphysics', but not in such a way as to have said anything that has not been said many times before by those who are not metaphysicians. Finally, is Heidegger himself a 'mystic' and his thought a 'mysticism'? What interest can 'philosophy' have in a thinker such as Heidegger?

(1) The most serious question raised by the controversial 'shift' in Heidegger's thought concerns the place of man in his philosophy. This is a troublesome issue, in which the deep transformation which Heidegger's thought has undergone comes plainly into view. Dasein is no longer conceived in terms of its freedom and self-possession, as the being which 'has its Being to be' (SZ, §4, p. 12), which must actively take over and choose its Being. Rather the Being of Dasein is to stay open to the address of Being. Its characteristic mood is not 'anxiety' but 'composure' (*Gelassenheit*). It does not raise the question of Being but lives 'without why', waiting for Being's self-disclosure. And, as if intentionally to complicate the issue, Heidegger's later works frequently denounce the notion of 'humanism'.

As we have already shown, this position has all the earmarks of the mystic's – and in particular of Meister Eckhart's – notion of the surrender of the soul to God. However, Heidegger's views are not for that reason inconsonant with any form of 'humanism', if 'humanism' means the attempt to establish the dignity of man and to preserve his essence. For Eckhart himself considered the union of the soul with God to be something which brings the soul into the fullness of its being. It certainly is not effected at the cost of the loss of the identity of the soul. This was something that the youthful Heidegger sensed about medieval mysticism when he said that the 'transcendent relation' of the soul to God is one in which both the absoluteness of God is affirmed and the integrity of the soul is preserved (DS, 239). The reason for this is that God and the

soul are not 'two things'; on the contrary God and the soul belong together: 'Many simple people think that they should look upon God as if He stood there and they stood here. But that is not so. God and I are *one*' (Q, 186). Were they not 'one' their union could be brought about only at the expense of one or the other. But the soul and God are of a kind: they are both so pure and detached, so removed from creatures, that they belong exclusively to each other.

Because the union of the soul and God is something that 'befits' each, is 'appropriate' to each, Eckhart is able to emphasize that nothing of what is 'proper' (*eigen*) to the soul is lost when it unites with God. As living things, he says, we act 'on our own', 'out of our own grounds' (*wir aus unserm eigenen wirken*). If we are united with God, then God must take over our being, but not in such a way that we are then moved by God as 'from the outside'. Rather, God must become 'our own' so that in being moved by God we will be moved 'from within on our own': 'If we should then live in Him or through Him, then He must be our own and we must work on our own' (Q, 176). So much 'our own' does God become for the detached heart that Meister Eckhart will not only say that that it is God who bears his Son in the soul, but also that it is the soul itself which bears the Son in itself (Q, 160; Théry, 264–5). Living 'in Him and through Him', according to Eckhart, is not a form of self-diremption, as it is portrayed in Hegel's discussion of 'unhappy consciousness', but a higher form of self-possession.

Eckhart's detached heart constitutes a model of 'religious humanism', i.e., the attempt to realize the fullness of being human by rooting human existence in the love of God. Whether or not such a program constitutes a 'true humanism' is a problem that can be finally decided only 'from within', by those who actually have undertaken such a life. But it is at least clear that there are no *a priori* arguments against the position that Eckhart adopts. Moreover, if we consult the history of Christian spirituality, we discover a number of interesting examples of individuals who testify in favor of what Eckhart says. One thinks for example of Francis of Assisi, a man whose love of God and spirit of poverty led him not to a 'contempt of the world' but, quite the contrary, to a rather remarkable sense of joy. It is simply nonsense to find in Francis a joyless self-effacement, an 'unhappy' and 'divided' consciousness.⁴⁴ What seems to be the case instead is that in Francis, who practiced the detachment of which Eckhart spoke, some ideal form of 'being human' was attained – to be sure, not one that all men must follow, but a unique and genuine one nonetheless.

The problem of 'humanism' in Heidegger is quite comparable to that in Eckhart. One main thrust of the word *Er-eignis* is to emphasize that Being and Dasein find in each other their 'proper' (*eigen*) complement. Just as he had said of the medieval *unio mystica*, Heidegger can say of

the Event of Truth that in it neither the 'transcendence' of Being (SZ, §7, p. 38) nor the integrity of man is destroyed. On the contrary, the Event of Truth provides the basis for a 'higher' humanism: 'Humanism now means, in the event we determine to hold on to this word: the essence of man is essential to the Truth of Being' (HB, 94). Humanism means to bring man into his essence and so to provide for the real 'worth' of man (HB, 75), a worth which every metaphysical humanism is unable to grasp:

One must be clear about the fact that, by this means, man remains enclosed in the essential realm of *animalitas*, even when one does not equate him with animals but rather attributes to him a specific difference. One is always thinking in principle of the *homo animalis* even if the *anima* is put as *animus* or *mens* and later as subject or person or spirit. Such a way of putting man is the manner of metaphysics. But man's essence is thereby taken in too lowly a way. . . . Metaphysics is closed off to the simple and essential certitude that man 'is' [*west*] only in his essence [*Wesen*], in which he is addressed by Being. Only in this address has he found that wherein his essence dwells.

(HB, 66)

The humanism which Heidegger repudiates is the metaphysical view which cannot rise above the conception of man as the rational animal. This rejection of humanism has nothing to do with recommending the inhumane (HB, 95), but with opening man up to the Truth of Being.

The 'Event' (*Er-eignis*) of Truth takes over in the later Heidegger the role that was once assigned in *Being and Time* to 'authenticity' (*Eigentlichkeit*), by which Dasein was brought back to its deepest and most individual possibilities and in which the hold which the 'they' exerts was broken. But the 'ownmost possibility' of Dasein in the later works is identified with its role in providing a place of disclosure for the Truth of Being. Nonetheless, one wonders whether this is anything more than a merely verbal maneuver. What possibilities for man lie in the 'Event'? The whole notion in the later Heidegger of a 'higher' humanism has a tendency to slip into a rather vacuous play on words.

However, it is possible to determine the renewal of human existence which Heidegger has in mind. Heidegger's thought originates, in part at least, in the phenomenological movement and so in Husserl's refutation of 'scientism', the theory that the only objective account of the world and of man is that supplied by the physical sciences. Heidegger's work has always in one way or another been a continuation of this protest against scientism. Just as with the earlier phenomenological analyses, meditative thinking attempts to gain access to a world to which calculative thought is closed off, a world which the later works call the 'fourfold'.

The technological world must be subordinated to the world in which man 'dwells'. To the extent that this is not done, man's 'dwelling' in the world is disrupted and even destroyed. The world of the 'fourfold', on the other hand, is eminently 'humane' – because it is more attentive to man's 'mortality' and to his belonging to the 'earth' (*humus*), because it affirms the truly 'divine' God and sees in the heavens the measure of lived time. It is interesting to note in this connection that the essay on the fourfold 'Building, dwelling and thinking' (1951) was addressed by Heidegger to a post-war Germany that was in the midst of a great housing shortage. 'Building', he holds, is more than a problem for civil and mechanical engineering; architecture is not merely a mathematical art. The real problem of housing, he concludes, is our ignorance of how to 'dwell' (VA, 162). Like Husserl and Merleau-Ponty, Heidegger struggles to establish the primacy of the 'life-world'. But Heidegger's effort is considerably more enigmatic – some might say 'profound' – because he thinks the world in which man dwells may be attained only by an attitude of 'openness to the Mystery' concealed in technology (G, 26).

One might further object, however, that according to Heidegger it is impossible for man to remake the world, to render it humane. And that is true enough in the sense that the movements of history (*Geschichte*) originate in the mission (*Geschick*) of Being (HB, 81); they are not subject to human control. While that is so, it remains true that the world cannot be remade *without* man's cooperation (K, 34, 38–9; VA, 180). Unless man is 'released' from the illusion that technology is something absolute and is open to the original *technē* concealed within technology, then the 'turn' (*Kehre*) in Being will never come to pass. Man cannot remake the world himself (a Marxian revolution for Heidegger is 'subjectivism' (HB, 88–9)), but he can 'let' it be remade. Like the man of God who holds that the world will never be reconstituted so long as men do not have recourse to God, Heidegger holds that the precondition for a renewal of the world is a thinking directed to Being. If man is open to Being, then – perhaps – Being will disclose itself to man. But in this 'perhaps' lies one of the largest difficulties with Heidegger's thought, and one which we shall examine in greater detail in the second question.

(2) If the movements of Heidegger's and Eckhart's thought are in so many ways parallel, if they even stand together in offering a view of a 'higher' humanism, then just where does Heidegger really differ from Eckhart? To answer this question, let us first turn to the concluding paragraphs of *The Talks of Instruction* in which, it seems to us, Eckhart expresses the 'spirit' of his thought:

To the extent that you are in God, to that extent will you have peace, and to the extent that you are outside God, you will be outside of

peace. If only something is in God it will have peace. As much in God, so much in peace. By this test you will know how much you are in God: by whether you have peace or lack peace. For where you lack peace, you *must* necessarily lack peace, for the lack of peace comes from the creature, and not from God. Everything that is in God is only to be loved; there is nothing in God which should be feared.

(*Q*, 100; e.t., 108)

Eckhart's God is a God of love. Of all the sacred authors it is from John that he draws the greatest inspiration. It is John, the 'beloved disciple', who writes: 'Think of the love that the Father has lavished on us, by letting us be called God's children; and that is what we are' (I John 3: 1). And around this text Eckhart is able to build his entire mystical speculation. God is first and foremost a loving Father for Eckhart, not a just judge or a supreme being or a first cause. The relationship between God and the soul is not one of fear – of offending God, of violating His Law – but of loving trust. Everything that is in God is to be loved, nothing is to be feared. 'Love cannot mistrust', he says, 'it can only trustfully await something good' (*Q*, 75). In the hands of a loving father one knows only trust and peace. And we are in the strongest sense God's sons, for we are not only 'called' children, but 'that is what we are'.

The situation is radically different, however, in Heidegger's case. For Heidegger must never speak of Being as loving or benevolent or fatherly. This is to treat Being as if it were the good will of the highest being. And that, as we have seen, is precisely the point upon which he criticizes Meister Eckhart's conception of *Gelassenheit*: it remains confined within the realm of willing (*G*, 35–6).

Dasein must be released not to the good will of the Father but to Being itself. But what is Being? In *Der Satz vom Grund* Heidegger answers: 'Being and ground [*Grund*]: the same. Being as grounding has no ground but rather as the abyss [*Abgrund*] plays that game which as mission [*Geschick*] plays up to us Being and ground.' Being for Heidegger is not the 'reason' (*Grund*, *ratio*) of Western metaphysics, but the ground which is equiprimordially an abyss. It is not a principle of thoroughgoing intelligibility, but it is just as much unintelligible. If the Heidegger of *Being and Time* protests what has become of 'human existence' in Hegel (*KPM*, 127, n. 196), the later Heidegger protests what has become of 'Being'. For in Hegel, whose claim to have consummated Western metaphysics Heidegger accepts, Being is identified with Absolute Reason and so is dissolved into a principle of lawfulness and regular development. The sequence of historical epochs is regulated by the principle of unfolding rationality. There is, as Leibniz demanded, a 'why' for every

historical event and every historical epoch. The distance that Heidegger has put between himself and Hegel's notion of Being is made plain in the minutes of the seminar on 'Time and being':

By what is the succession of epochs determined? Whence is this free sequence determined? One naturally recalls Hegel's history of the 'thought'. For Hegel history is dominated by necessity, which is simultaneously freedom. Both are for him one in and through the dialectical course, which is the way the essence of the spirit is. With Heidegger, on the other hand, one cannot speak of a 'why'. Only the 'that' – that the history of Being is such as it is – can be said. Consequently, in *Der Satz vom Grund*, Goethe's verse is cited:

How? When? and Where? – The gods remain silent.

You keep yourself in the *because* and do not ask *why*?

(ZSD, 55–6; cf. SG, 206ff.)

Heidegger's Being is a ground without ground, as Eckhart's God is 'principle without principle' (*principium sine principio*) in the words of the *Liber XXIV Philosophorum* (LW, III, 16, n. 1). For Eckhart this means that God is the fullness of being (*plenitudo esse*), a principle of consummate goodness and perfect intelligibility, the final explanation, the ultimate rationale which needs no reason beyond itself. But for Heidegger, Being is a ground which does not itself admit of explanation. Being comes to pass as it does. That is all one may say. At the end of 'Time and being', Heidegger writes: 'What does there remain to say? Only this: the Event of Appropriation comes to pass [*Das Ereignis ereignet*]' (ZSD, 24). No further determination of the Event can be made. One must be satisfied with 'because' and not ask 'why?' Dasein must be 'without why'. And whereas for Eckhart this meant that the soul should act not because God commands it to act, but rather in loving unity with, and on the basis of, God's indwelling presence (Théry, 236–7), for Heidegger it means that Dasein must openly acknowledge the inscrutability of Being.

Because the Event is both ground and abyss, Heidegger calls it, in one of his most striking characterizations, a 'play' (*Spiel*).⁴⁵ The history of Being is the history of the play of Being, of its fluctuating retreat and advance, revelation and concealment. The process has no more rationale than that, and to the extent that one gives it a rationale one forces the categories of metaphysics upon it. Thus Leibniz's remark, 'When God calculates the world is made', is emended by Heidegger to read, 'While God plays the world comes to be' (SG, 186). And Heidegger cites with approval the following fragment from Heraclitus:⁴⁶ 'Time is a child playing a game of draughts; the kingdom is in the hands of a child' (cf. SG,

187–8). Not only might one say ‘It gives’ (*Es gibt*) and ‘It uses’ (*Es brauchet*), but now we may add ‘It plays’ (*Es spielt*): ‘Because is swallowed up in the play. It plays because It plays. There remains only play: the highest and the deepest’ (SG, 188).

That is why, where the author of *The Book of Divine Consolation* can speak of peace, Heidegger speaks of a ‘venture’, a ‘wager’ on the outcome of a portentous game: ‘We must venture out into the play of language upon which our being is staked’ (WD, 87). Again, man must confront ‘the high and dangerous play upon which the being of language has staked us’ (WD, 84). Technology (*Technik*) is the ‘danger’ (*Gefahr*) for Heidegger. It is a concealment of the Truth of Being. It distorts the meaning of nature, of dwelling in the world, of thinking and of man himself. It is a danger which man did not bring on himself but which Being itself has perpetrated. Being itself has withdrawn in its truth and has advanced in the form of an untruth. The illusions of the age of technology are mistakes for which no man is responsible.

Accordingly Dasein does not ‘trust’, it can only ‘hope’ (VA, 41–2). Indeed, Heidegger has undermined all possible ‘grounds’ for trust (and even for hope). For, in the first place, having broken with the metaphysical tradition of the ultimate intelligibility of Being, he has divorced Being from all rationale, from all lawful becoming, from all rational governance. Moreover, he has also divorced Being from any possible personalistic conception. It is no accident that there is *no* talk of ‘father’, ‘son’, or ‘giving birth’ in Heidegger’s account of the relationship between Being and Dasein, whereas these are the dominant expressions in Eckhart’s Christian, indeed Johannine mysticism. And in my view this must be counted as the most decisive difference of all between Eckhart and Heidegger. Heidegger uses many metaphors to explain the relationship of Being and Dasein – giving, using, thanking, playing, saying, etc. – but never ‘giving birth’ as a ‘father’ generates his ‘son’.⁴⁷ The reason for this is not that the relationship of father and son is an ‘ontic’ relation between things, because that is also true of giving and playing and all the rest. The point is that some ontic relations are capable of being reworked and transformed so as to become possible ways of speaking – in a ‘non-objective’ way (PT, 37ff.) – about Being and Dasein, and some are not. The relation of father and son is not susceptible of such a reworking because it is a radically personal relationship, and as such involves such dispositions as love and trust. And it is as plainly nonsensical to describe Being in these categories as it would be to describe it in terms of the categories of Hegel’s *Logic*.

And so Heidegger asks: Will the illusions of the age of technology pass (ID, 71)? Will the ‘West’ (which Heidegger takes to be a true ‘evening-land’ [*Abendland*]) become the eve of a new day? Will man ever get beyond the conception of himself as the ‘rational animal’ (SG,

210–11)? These are only questions: no one knows the answers. The answers depend upon the possibilities that inhere in the Event, possibilities that Heidegger himself calls 'dark' and 'uncertain' (ZSD, 66). One does not 'trust' in the outcome of the Event. The best one can do is wait (G, 37); the only 'serenity' (*Gelassenheit*) one has is to know there is nothing more one can do. Dasein may prepare for the possibility of a 'new beginning': it may open itself to it. But Dasein can neither effect it nor trust in its coming to pass. Eckhart so trusted that God would return love with love that he said we could 'force' God to come to us (Théry, 218–19). Eckhart said that although there are unknown depths in God, and the Godhead is an 'abyss' of which nothing can be spoken, still there is nothing to fear in God; everything in God should only be loved (Q, 100). But there is nothing in Heidegger's *Ereignis* to love and almost everything to fear and mistrust. This seems to me to constitute a serious problem with Heidegger's thought, and one to which insufficient attention is paid.⁴⁸ It is hard to see how the 'releasement' for which Heidegger asks can continue to make any sense once it is detached from its religious context, i.e., from its relationship to a loving God, and is related to the idea of Being which he puts forward.

It is true that Heidegger does speak of the Event as 'giving' and of Dasein as 'thanking', which does endow the Event with something of a benevolent aspect (WM, 49; WD, 94). Such personalistic language is close to Eckhart's, for the Father gives the 'gift' (*gratia*) of the Son and the soul is indeed grateful. However, while one may accept Eckhart's expressions quite literally, all Heidegger has done is to adopt another 'model' for thinking out the relationship of Being and Dasein. The Event does not literally give, because literally to give is to give a 'gift', and a 'gift' is an expression of good will, whereas the relationship of Being and Dasein must be gotten beyond the realm of willing. Giving implies a benefactor and it implies gratitude, neither of which Heidegger seriously means to suggest. What Heidegger does mean by the model of 'thanking' seems to be this. The revelation of Being is nothing that Dasein can bring about – e.g., through its 'questioning' as *Being and Time* supposed. Only Being itself can effect it. Consequently, if Being is revealed to Dasein it comes 'gratuitously', as it were, and as a 'gift' (or 'favor'). Dasein however cannot and will not receive the gift if it is not disposed towards the giver as a recipient should be, viz., with 'gratitude'. The correct disposition of Dasein towards the self-revelation of Being is 'openness' towards it or simply 'thinking' (*Seinsdenken*). Hence Dasein's 'gratitude' is 'thinking'; its 'thinking' (*Denken*) is 'thanking' (*Danken*). The whole notion of 'thanking' therefore rests not on any personalistic overtones of the Event but on the kinship – etymological or otherwise – of '*Denken*' and '*Danken*'. Indeed, the whole notion of 'giving' arises out of a sentence in *Being and Time* which Heidegger

would like to reinterpret and which uses the phrase *es gibt* (SZ, §43, p. 212).

There is nothing benevolent about the giving of the Event; there is no gratitude in the thanking of Dasein. Heidegger is not talking about any sort of personal presence, but about 'manifestness'. He does not conceive of the coming to be of manifestness in terms of the loving care of a father but, on the contrary, in terms of a 'world play' (*Weltspiel*). While the 'concern' (*Sache*) of Eckhart's thinking is with a loving Father, the 'concern' of Heidegger's thought is history and the secular.

(3) Does it not emerge from this discussion that Heidegger is a mystic, although of a rather different cut than Eckhart? There are varieties of mystical experience, and not all mystics subscribe to the notion of a personal and loving Father, as Eastern mysticism testifies. One can amass an impressive argument in favor of 'Heidegger's mysticism'. To begin with, Heidegger himself has repeatedly said that what he is doing is *not* philosophy (ZSD, 61ff.). The sum and substance of philosophy is metaphysics, he says, and his thinking goes beyond metaphysics. It is something of a strange phenomenon, after all, to see so many books and articles and lectures by professors of philosophy devoted to a thinker who vigorously protests against being considered a philosopher. How seriously have these authors considered Heidegger's protests?

If 'mysticism' is a non-discursive, directly intuitive experience of a 'truth' which neither common sense nor rational argumentation can attain, then Heidegger seems to bear the essential trademark of the mystic. 'Sound common sense' is for him the thoughtlessness of the 'they'. 'Reason' is the illusion that Being submits to the prescriptions of the thinking subject. The 'Truth of Being', to which reason and metaphysics have no access, can be attained only in a 'leap' (*Satz, Sprung*: WD, 4-5; SG, 95-6) which reminds us strongly of the *intuitus mysticus*. Heidegger does not offer arguments for his position. To 'argue' is to fall victim to the illusion that 'reason' is the final arbiter of what is true. In the later Heidegger, argumentation is replaced by a cryptic, even oracular tone. Compared to the later works *Being and Time* is a carefully developed work. To illustrate this point a lecture is given in 1962 which bears the same title as the third, unpublished Division of *Being and Time*, 'Time and being'. Some twenty-five pages long in its printed form, it concludes that all there is to say is *Das Ereignis ereignet*. And the last sentence of the lecture is an apology for the fact that the lecture itself is an obstacle to the saying of the *Ereignis*. The lecture makes affirmations, whereas the sentences in which the Event is to be expressed are not assertions (*Aussagen*). They are not 'true' or 'false' nor do they demand a 'justification' ('sufficient reason').

It is a long way from the Socrates of the Platonic dialogues, who does not relent until a sound argument is brought forth, to 'Time and being'.

The later Heidegger has intentionally left the Platonic dialogues behind, and with them the whole notion of argumentative thinking. If philosophy must give arguments, then Heidegger has indeed left philosophy, just as he says.

Nonetheless, it does not follow that he has left philosophy for mysticism. The book on Eckhart was never written, after all, but there are numerous essays on the poetry of Hölderlin and Trakl. If Heidegger's 'thinking' (*Denken*) has gone beyond philosophy it has moved more in the direction of poetry than of mysticism. We recall the divergence of Heidegger and Eckhart on the nature of language. Heidegger does not wish to cut off propositional language for the sake of silence – which would be a typically mystical move, and which Eckhart advocated – but for the sake of a non-propositional language, a language akin to that of the poet. Heidegger insists upon reticence and carefulness about language, not upon mystical silence, and he finds this care only in poetry (*WM*, 50–1). Hence even if the mode or style of the later Heidegger is inconsonant with what most Western thinkers have traditionally called philosophy, it does not follow that it is mysticism.

However, there is an even stronger reason for distrusting the suggestion that Heidegger is a mystic, a reason which, it seems to us, justifies the great interest that 'philosophers' have shown in his work. It concerns not so much the 'style' of his thought but its 'content'. We remarked above, in contrasting Heidegger with Eckhart, upon the 'secular' character of Heidegger's work. We wish to understand this word in its deepest sense: 'secular' is that which characterizes the *saeculum*, the age; but an age or epoch is always, for Heidegger, a 'mission of Being'. Hence the secular character of Heidegger's work consists in his commitment to comprehending the history of the West, and to comprehending the present age in terms of Western history, a commitment quite foreign to Eckhart who wished to see God in things so that we might one day – in eternity – see things in God (*Q*, 61). Heidegger's thinking is for a 'time of need', the age of technology, in which he holds the 'truth' of being human and of Being itself is covered up. The age of technology is for him a metaphysical event, and he wishes not to condemn it but to think it through. The technological age summons man, according to Heidegger, to a meditation upon the history of Western metaphysics.

Hence the question which Heidegger asked in 1929 remains the essential one: What is metaphysics? Metaphysics is to be overcome, but it is not to be laid aside (*WM*, 9). On the contrary, metaphysics contains the truth of Being in a concealed way (*WM*, 44). Heidegger's thought consists in a dialogue with the history of metaphysics in the hope of uncovering what it has concealed. From Aristotle's question about the being as such Heidegger 'retrieves' the question about the Truth of Being. From Descartes' reduction of the world to *res extensa* he retrieves the

primordial spatiality of Dasein (*SZ*, §21, p. 101). In Leibniz's formulation of the principle 'no being is without a ground', Heidegger hears the 'ringing together' of Being and ground, the ringing of Being as the groundless ground. From the idea of truth as correspondence (*adequatio*) Heidegger is able to think truth as unconcealment. In Nietzsche's 'history of nihilism' Heidegger finds the history of metaphysics itself (*N II*, 343).

Metaphysics has always been the medium in which Heidegger learned what he says. His thinking has largely consisted in finding another way of saying what he has learned. He says what metaphysics would say were it able – the Truth of Being (*N II*, 353–4, 397). The history of metaphysics is the hiding place of Being, and Heidegger's thought has been a radical attempt to uncover the wealth hidden *in* and *by* that tradition (*HB*, 77). Heidegger does not renounce metaphysics but lays bare its essence. And who but 'philosophers' would be interested in such a task? It is very doubtful that his thinking will interest any who are not interested in metaphysics, and even more doubtful that it can be comprehended by any who do not comprehend metaphysics. Heidegger has invigorated contemporary philosophical thinking and, despite what he himself says, deals with issues that are only of interest to those who think in that tradition which begins with the presocratics and which all have called 'philosophy'.

What, then, does this question of Heidegger's mysticism amount to? Just this, I think: that one way of understanding Heidegger is to see his thought in an analogy with a mystic like Meister Eckhart; that certain analogies can be drawn between Heidegger and the mystics, analogies which are instructive and illuminating and indeed even based on the historical evidence of Heidegger's early interest in medieval mysticism. But to argue that Heidegger is a mystic is to distort much more of Heidegger's thought than it illuminates. The analogy is but an analogy.

One must be careful not to be fooled by Heidegger. He appropriates the talk of the mystic, and much of the structure of the 'mystical union' of the soul with God, but he makes these things over for his own purposes and to his own liking. Heidegger has been interested in theological issues from the very beginning of his studies, and he has long been transforming the ideas and the language of the Western religious tradition. He did this in *Being and Time* (fallenness, guilt, conscience) and he has done it again in his later work. For Heidegger, Being is a 'play' and the task of thinking is to 'play along' (*mitspielen*: *SG*, 188) with Being. To bring Being to language is a 'game' (*WD*, 83), for Being as primordial language holds itself back and resists saying. Hence Heidegger must resort to all available resources to bring Being to words; all are 'fair game'.

The mystic for Heidegger is a kin and an ally, who says a great deal of what Heidegger himself wants to say: there is more to thinking than

reasoning; true language depends upon silence; in *Gelassenheit* a deeper truth reveals itself. And so Heidegger freely takes over and uses what he finds of service in the mystic, and particularly in Meister Eckhart. But Heidegger remains throughout his own man. The mystic is concerned with the eternal, the 'thinker' with time. Even the poet is to be distinguished from the thinker (*WM*, 51), for the poet does not think Being as Being but as the 'holy'.⁴⁹ While Heidegger's thinking is conducted in proximity to the poet and to the mystic, Heidegger's abiding interest lies in the age old 'issue' (*Sache*) of philosophy, the question of Being. It is this question which first stimulated his thinking and it is to this question that he has subsequently subordinated all other alliances.⁵⁰

Notes

1 We refer to the works of Heidegger with the following abbreviations: *DS*: *Die Kategorien- und Bedeutungslehre des Duns Scotus* (Tübingen: J. C. B. Mohr, 1916). *EM*: *Einführung in die Metaphysik*, 2. Auflage (Tübingen: Max Niemeyer, 1958). *FND*: *Die Frage nach dem Ding* (Tübingen: Max Niemeyer, 1962). *FW*: *Der Feldweg*, 3. Auflage (Frankfurt: V. Klostermann, 1962). *G*: *Gelassenheit*, 2. Auflage (Pfullingen: Verlag G. Neske, 1960). *HB*: 'Brief über den "Humanismus"' in *Platons Lehre von der Wahrheit Mit einen Brief über den 'Humanismus'*, 2. Auflage (Bern: A. Francke Verlag, 1954). *HW*: *Holzwege*, 4. Auflage (Frankfurt: V. Klostermann, 1963). *ID*: *Identität und Differenz*, 3. Auflage (Pfullingen: Verlag G. Neske, 1957). *K*: *Die Technik und die Kehre* (Pfullingen: Verlag G. Neske, 1962). *KPM*: *Kant und das Problem der Metaphysik*, 3. Auflage (Frankfurt: V. Klostermann, 1956). *N I*, *N II*: *Nietzsche*, 2 Bände (Pfullingen: Verlag G. Neske, 1962). *PT*: *Phänomenologie und Theologia* (Frankfurt: V. Klostermann, 1970). *ZSD*: *Zur Sache des Denkens* (Tübingen: Max Niemeyer, 1969). *SG*: *Der Satz vom Grund*, 3. Auflage (Pfullingen: Verlag G. Neske, 1965). *SZ*: *Sein und Zeit*, 10. Auflage (Tübingen: Max Niemeyer, 1963). *US*: *Unterwegs zur Sprache*, 3. Auflage (Pfullingen: Verlag G. Neske, 1965). *VA*: *Vorträge und Aufsätze*, 2. Auflage (Pfullingen: Verlag G. Neske, 1959). *WD*: *Was Heisst Denken?*, 2. Auflage (Tübingen: Max Niemeyer, 1961). *WG*: *Vom Wesen des Grundes*, 5. Auflage (Frankfurt: V. Klostermann, 1965). *WM*: *Was ist Metaphysik?*, 9. Auflage (Frankfurt: V. Klostermann, 1965). *WW*: *Vom Wesen der Wahrheit*, 4. Auflage (Frankfurt: V. Klostermann, 1961). All translations are our own. When we consult the following translations, we refer to them by 'e.t.' after citing the original text: *G*: *Discourse on Thinking*, trans. John Anderson and E. Hans Freund (New York: Harper, 1966). *WD*: *What is Called Thinking?*, trans. F. D. Wieck and J. Glenn Gray (New York: Harper, 1968).

2 Martin Grabmann would later show the author to be one Thomas of Erfurt, not Duns Scotus.

3 Hans Siegfried, 'Martin Heidegger: a recollection', *Man and World*, III, 1 (February, 1970), 4.

4 Cf. Karsten Harries, 'Martin Heidegger: the search for meaning', in *Existential Philosophers: Kierkegaard to Merleau-Ponty*, ed. G. A. Schrader (New York:

McGraw-Hill, 1967), pp. 162–8, and Richard Schmitt, *Martin Heidegger on Being Human* (New York: Random House, 1969), pp. 55–102.

5 We leave '*Dasein*' untranslated and always refer to it in the neuter.

6 Meister Eckhart of Hochheim (1260–1327/9) was the most celebrated preacher of his day and the foremost representative of fourteenth century German mysticism. A bull in 1329 condemned twenty-eight propositions extracted from his writings. Consequently the Latin writings were largely ignored until H. S. Denifle revived interest in them in 1885. It was through his German treatises and sermons that Eckhart exerted his influence on the German tradition. Our references to Eckhart's works will be as follows: *LW: Meister Eckhart: Die deutschen und lateinischen Werke*, hrsg. im Auftrage der Deutschen Forschungsgemeinschaft, *Die Lateinische Werke*, ed. Ernst Benz et al. (Stuttgart: Kohlhammer, 1936–). *DW: Die Deutsche Werke*, ed. Josef Quint (Stuttgart: Kohlhammer, 1936–). *Q: Meister Eckhart: Deutsche Predigte und Traktate*, ed. and trans. Josef Quint (München: Carl Hanser, 1963). Théry: Gabriel Théry, 'Edition critique des pièces relatives au procès d'Eckhart', *Archives d'histoire doctrinale et littéraire du moyen age*, I (1926), 129–268. There is no better antidote to the extravagant misinterpretation to which Eckhart is exposed than this document, which is the record of his defense against the charge of heresy. We have consulted the following in preparing our own translations: *Meister Eckhart: Selected Treatises and Sermons*, ed. and trans. James Clark and John Skinner (London: Faber and Faber, 1958), referred to as 'e.t.'

7 Martin Heidegger, 'Der Zeitbegriff in der Geschichtswissenschaft', *Zeitschrift für Philosophie und philosophische Kritik*, CLXI (1916), 173.

8 Käte Oltmanns, *Meister Eckhart*, 2. Auflage (Frankfurt: V. Klostermann, 1957); cf. especially p. 10. See n. 10, *infra*.

9 Thomas Aquinas, *Questiones Disputatae de veritate*, Q, I, a. 1, c.

10 In a work which appeared after our study was completed, Reiner Schürmann – *Maître Eckhart ou la joie errante: Sermons allemands traduits et commentés* (Paris: Editions Planète, 1972) – offers an excellent interpretation of Eckhart which relies heavily on Heidegger's views. As he notes (p. 339, n. 91) this has already been attempted by Oltmanns but with questionable results. His own efforts are more successful, I think, because he depends upon the later Heidegger and not, as did Oltmanns, upon *Sein und Zeit*. Schürmann's thesis is that the confusion that has surrounded Eckhart for six centuries is due to interpreting his thought as a 'metaphysics' concerned with substances considered statically. In fact, Eckhart is concerned not with substance but event (p. 66, n. 46), and with the 'path' of the soul *en route* to God ('peregrinal ontology'), which is the path of detachment (p. 170). A concluding section (pp. 380ff.) confronts Heidegger and Meister Eckhart on *Gelassenheit* (and in particular, G, 23–8). See also Schürmann, pp. 11, 98, 164, 201, n. 94, 210, n. 112, 219, 283–4, n. 28. There are at least two basic differences between Schürmann's work and ours: (1) His work is not a comparison of Heidegger and Eckhart, but an interpretation of Eckhart which has recourse to the thought of Heidegger; our concern is with an assessment of Heidegger on the basis of a comparison with Eckhart. (2) While Schürmann does discuss the differences between Eckhart and Heidegger (pp. 358–61, 365–7), he does not seem to hold that their consequences are as grave as we will point out below (IV). Heidegger's 'way' (*Denkweg*) is hardly one of joy (*la joie errante*), though this aptly describes Eckhart's experience (pp. 14, 367, last paragraph).

Eckhart's importance for Heidegger is also briefly noted by Laszlo Versényi, *Heidegger, Being and Truth* (New Haven: Yale University Press, 1965), p. 152

and Reuben Guilead, *Etre et liberté: Une étude sur le dernier Heidegger* (Louvain: Editions Nauwelaerts, 1965), pp. 172–3.

11 *The Later Heidegger and Theology*, eds. James M. Robinson and John B. Cobb, Jr. (New York: Harper & Row, 1963), pp. 42–3.

12 Vladimir Lossky, *Theologie négative et connaissance de Dieu chez Maître Eckhart* (Paris: J. Vrin, 1960), pp. 335–6.

13 If this phrase resembles anything in the Idealists, it is the 'one' of Schelling's *Identitätsphilosophie*, although Eckhart's 'one' does not stand in need of mediation or diversification because it is already the fullness of being (*plenitudo esse*).

14 The 'abyss' (*Abgrund*) of the Godhead is another of those seminal ideas of Eckhart. It reappears again most notably in Jacob Boehme's *Un-grund* and so in Schelling (see n. 16). Some have – with good reason – placed Heidegger's *Nichts* in this tradition. Cf. William Kluback and Jean Wilde, Preface, in Martin Heidegger, *The Question of Being* (London: Vision, 1956), p. 9 and E. B. Koenker, 'Potentiality in God: Jacob Boehme', *Philosophy Today*, XV (Spring, 1971), 44ff.

15 Compare this passage with the depiction of 'life' in Hegel, *The Phenomenology of Mind*, trans. J. Baillie (London: Allen & Unwin, 1966), pp. 220–4.

16 Cf. John Loesch, 'The God who becomes: Eckhart on the divine relativity', *The Thomist*, XXV (July, 1971), 405–22.

17 Heidegger refers to this 'little spark of the soul' (*Seelenfünkeln*) in *WD*, 96. He regards it as an unsuccessful attempt to transcend the notion of man as the 'rational animal'. Only the notion of *Dasein* and of its 'memory' (*Gedächtnis*) seizes man in his relationship to Being. And of course, Eckhart's notion cannot 'succeed' in Heidegger's terms, for Eckhart is not interested in conceiving of the soul as a relationship to Being, but as a relationship to God. In Eckhart's terms, Heidegger does not succeed in gaining a view of man in his essential relationship to God. Once again, the similarity between Eckhart and Heidegger is structural.

18 This indicates how free of any vestige of an anthropological conception Eckhart wished to keep the *Fünkeln*. Heidegger's criticism of Eckhart in *WD*, 95 (cf. *supra*, n. 17) does not at all take this into account.

19 Eckhart uses *Wesen* as a translation of *esse* and hence in its original sense as 'Being', the verbal sense which Heidegger of course wishes to revive. Cf. *Anmerkungen*, Q, 537–8.

20 Martin Grabmann, *Der Einfluss Alberts der Grossen auf das mittelalterliche Geistesleben: Das deutsche Element in der mittelalterlichen Scholastik und Mystik* (München, 1926–36), II, 324–72. Cf. Etienne Gilson, *A History of Christian Philosophy in the Middle Ages* (New York: Random House, 1955), pp. 431–6. The idea is ultimately of Augustinian origin.

21 D. T. Suzuki, *Mysticism: Christian and Buddhist* (New York: Macmillan, 1969). Rudolf Otto, *Mysticism East and West*, trans. B. Bracey and R. Payne (New York: Macmillan, 1962). Shizuteru Ueda, 'Maître Eckhart et la buddisme zen', *La vie spirituelle*, 53 (January, 1971), 34–5, 40–1.

22 All scriptural citations are from *The Jerusalem Bible* (Garden City, New York: Doubleday, 1966).

23 The Idealists too insisted that the Incarnation was not restricted to the empirical individual Jesus of Nazareth.

24 *The Jerusalem Bible*, 'The New Testament', p. 411, n.a.

25 Hugo Rahner, 'Die Gottesgeburt', *Zeitschrift für Katholische Theologie*, 59 (1933), 333–418. Rahner concludes: 'The idea flowed to him from a thousand

sources; it is age-old; it is one of the essential pieces of Christian mysticism of all centuries' (p. 411).

26 Thomas Aquinas, *Summa Theologica*, Ia, Q. 27, a. 1, c.

27 Eckhart's mystical doctrine seems remarkably at times to resemble Kant's 'moral formalism'. For both thinkers no merely 'material' principle should ever determine the will; for both, material principles are principles of 'self-love'. What Kant calls 'heteronomous' activity, Eckhart calls 'dead works'.

28 Because *Gelassenheit* means surrendering one's own will and accepting God's, we have translated it sometimes as 'resignation' and sometimes as 'abandonment'. In ordinary German it means 'composure'. Cf. n. 36, *infra*.

29 Angelus Silesius, *Cherubinischer Wandersmann*, Eingeleitet und unter Berücksichtigung neuer Quellen erläutert von Will-Erich Peuckert (Bremen: Carl Schünemann Verlag, 1956), I, No. 8; No. 100. Hereafter *CW*.

30 Cf. Ernst von Bracken, *Meister Eckhart und Fichte* (Würzburg, 1943).

31 That is in part why Hegel cites the following text from Eckhart in his *Lectures on the Philosophy of Religion*: 'Das Auge, mit dem mich Gott sieht, ist das Auge, mit dem ich ihn sehe, mein Auge und sein Auge ist eins. In der Gerechtigkeit werde ich in Gott gewogen und er in mir. Wenn Gott nicht wäre, wäre ich nicht, wenn ich nicht wäre, so wäre er nicht. Dies ist jedoch nicht Noth zu wissen, denn es sind Dinge, die leicht missverstanden werden und die nur im Begriff erfasst werden können' (*Sämtliche Werke, Vorlesungen über die Philosophie der Religion*, I (Stuttgart: Frommanns, 1959), 228). For Hegel, Eckhart seems to say that the Absolute came to know itself in the same act in which man rose to a knowledge of the Absolute. Whereas in fact Eckhart is alluding to the Aristotelian doctrine that the knower-in-act and the knowable-in-act are one, and to *De trinitate*, Bk. IX, c. 12, in which Augustine says that the knower and the known, when thus united, conceive a common offspring – for Eckhart, the Word which is born in the soul (Théry, 224–5, 238). Moreover, Hegel's text is corrupt. The first sentence should read: 'Das Auge, in dem ich Gott sehe, das ist dasselbe Auge, darin mich Gott sieht; mein Auge und Gottes Auge, das ist ein Auge und ein Sehen und ein Erkennen und ein Lieben' (Q, 216). The second sentence I find nowhere in Quint, although it is doctrinally akin to Q, 267–9. The third and fourth sentences, which would be easily misinterpreted if one were not familiar with the distinction between *Gott* and *Gottheit*, are found in another sermon altogether and should read: 'Wäre aber ich nicht, so wäre auch "Gott" nicht: dass "Gott" ist, dafür bin ich die Ursache; wäre ich nicht, so wäre Gott nicht "Gott". Dies zu wissen ist nicht not' (Q, 308). *Gott* is a name assigned to the divine being in virtue of its relationship to creatures. Hence if I were not – i.e., if I were not created – God would not be called 'God', i.e., the cause of being. Eckhart also refers to the ideal preexistence of the self as an Idea in the Divine Mind. The last half of the fourth sentence, which represents Hegel's but not Eckhart's views, I find nowhere in Quint.

The faultiness of Hegel's text and the misuse he makes of it indicate the extreme caution with which one should proceed in bridge-building between Eckhart and the Idealists. Heidegger himself had much more reliable information about Eckhart, including the Latin works. In fact, Heinrich Ott, in a conversation at the Heidegger Colloquium at Pennsylvania State University (October, 1969), told me that Heidegger had expressed to him an even *greater* interest in the Latin works than the vernacular. On the question of Eckhart and the Idealists, cf. Ernst Benz, 'Die Mystik in der Philosophie des deutschen Idealismus', *Euphorion*, 40 (1952), 280–300. Ingeborg Degenhardt, *Studien zum Wandel des Eckhartbildes* (Leiden: Brill, 1967), pp. 110ff.

32 We have chosen 'transcendent' as a neutral term to refer indifferently to Heidegger's 'Sein'.

33 Joan Stambaugh's translation of '*Ereignis*' as 'Event of Appropriation' takes into account both senses of the word which Heidegger intends, viz., 'coming to pass' and 'appropriation' (cf. Martin Heidegger, *Identity and Difference*, trans. Joan Stambaugh (New York: Harper, 1969), p. 14, n. 1). Schürmann quite rightly stresses that Heidegger and Eckhart articulate the *Gottesgeburt* and the *Ereignis* in the language of 'Event' and 'happening', and not of substance (see Schürmann, pp. 66, n. 46; 201, n. 94).

34 Zygmunt Adamczewski, 'On the way to being', in Heidegger and the Path of Thinking, ed. John Sallis (Pittsburgh: Duquesne University Press, 1970), pp. 13–18.

35 In assigning such importance to the poet Heidegger is anticipated by Shelling, not by Eckhart.

36 Since Heidegger uses *Gelassenheit* to emphasize the necessity of 'letting' Being be, his English translators have rendered it as 'releasement', a convention we shall adopt as well (cf. William Richardson, *Heidegger: Through Phenomenology to Thought* (The Hague: Martinus Nijhoff, 1963), p. 504. See *supra*, n. 28).

37 Cf. *FND*, 76 where Heidegger discounts the possibility of beginning 'modern' philosophy with Eckhart instead of Descartes. This is because Eckhart repudiates the 'ego' as the highest principle of philosophy, placing the value of the subject matter before that of the self (*DS*, 7).

38 In this context *Eigentlichkeit* sounds more like *Eigenwille* than its opposite, which raises the question of the compatibility of the later notion of *Gelassenheit* with *Being and Time*'s view of *Eigentlichkeit*.

39 Jeffrey L. Sammons, *Angelus Silesius*, Twayne's World Authors Series (New York: Twayne's Publishers, 1967), pp. 44–5. On Eckhart and this saying of Silesius, see Ueda, pp. 38ff.

40 How is the later Heidegger to be reconciled with the author of *Being and Time*, for whom the essence of Dasein consisted in raising the question of Being? See my 'The rose is without why: an interpretation of the later Heidegger', *Philosophy Today*, 15 (Spring 1971), 3–15.

41 In ordinary German, of course, *es gibt* means 'there is' (French: *il y a*). But Heidegger takes it literally as 'It gives' (cf. *SZ*, §43, p. 212; *HB*, 78ff.; *SD*, 1–25).

42 Lossky, pp. 307–20.

43 See the controversy surrounding this text in Richardson, pp. 562–5.

44 Cf. Johan Huizinga, *Homo Ludens: A Study of the Play Element in Culture* (Boston: Beacon Press, 1955), pp. 139–40; Evelyn Underhill, *Mysticism* (New York: Dutton & Dutton, 1961), pp. 439–40.

45 I have explained the 'play of Being' more carefully in my 'Being, ground and play in Heidegger', *Man and World*, 3 (February, 1970), 26–48. Using Heidegger's 'play' of the foursome and Angelus Silesius (*CW*, II, no. 198) as a basis, Schürmann (pp. 204ff.) construes a 'play' – the word is not Eckhart's – between God and the soul in Eckhart. Even so, there is nothing of the ominous wager which belongs to Heidegger's play of Being in Schürmann's hypothesis.

46 Heraclitus, Fragment 52, in Kathleen Freeman, *Ancilla to the Pre-Socratic Philosophers* (Oxford: Basil Blackwell, 1962), p. 28.

47 Adamczewski's translation of *Ereignis* as 'bearing' would therefore be misleading (cf. Zygmunt Adamczewski, 'Martin Heidegger and man's way to be', *Man and World*, 1 (1968), 369ff.).

48 Laszlo Versényi has pointed out such difficulties (cf. Versényi, pp. 152–8).

49 This seems to mean that the poet experiences Being but he does not express it in the language of the thought of Being (*Seinsdenken*). Hence it is up to the thinker to 'translate' the poet.

50 One can hardly close the question of Heidegger and mysticism with an examination of Heidegger's relation to Eckhart. The whole area of his affinities to Eastern mysticism needs to be discussed. Cf. 'Heidegger and Eastern thought', *Philosophy East and West*, 20, 3 (July, 1970). See also Peter Kreeft, 'Zen in Heidegger's *Gelassenheit*', *International Philosophical Quarterly*, 11, 4 (December, 1971), 521–45.

Heidegger and Descartes

Jean-Luc Marion

1 The continuing presence of Descartes in the development of Heidegger's thinking

Although it is more or less taken for granted that Heidegger never ceased to be concerned with Nietzsche or Aristotle, his relation to Descartes can very easily appear to be secondary. Neither those who comment on Heidegger nor those who examine Descartes have much to say on the relation of the former to the latter, indeed both are quite likely to ignore it altogether. Whatever the reasons might be for this oversight they cannot diminish the significance of one solid fact: even if one only considers the matter chronologically, Descartes appears at the very outset of Heidegger's career and preoccupies him right up to the very end. To take account solely of the texts which have already been made available through the publication of the *Gesamtausgabe* (in 1985), evidence of an intense debate with Descartes is to be found from 1921 right up to 1974.

In a course of lectures, given as a *Privatdozent* at Freiburg during the Winter term 1921/2, under the title *Phänomenologische Interpretationen zu Aristoteles: Einführung in die Forschung*, the only course of lectures prior to the Marburg period which is still available, Heidegger does not so much deal with Aristotle as sketch out an introduction to phenomenology; however, this introduction opens up a philosophy. Instead of Aristotle it is Descartes who is in question. First taking account of the *Ich-Metaphysik* in its Kantian and phenomenological moments he ends up with Descartes, whose limitations are already clearly marked out. The 'sum' is certainly supposed to be as primary for Descartes but it is precisely at this point that the difficulties emerge. For instead of sticking to the 'sum' he already opens up a pre-conception of the meaning of being in the mode of a simple affirmation (*Feststellung*) and moreover an affirmation of the indubitable character of being (*Unbezweifelbaren*).

The fact that Descartes was able to deviate in the direction of a posing of the epistemological question and even, from the standpoint of the history of ideas (*geistigesgeschichtlich*), managed to inaugurate such a question only gives expression to the fact that the 'sum', its being and its categorial structure, did not present a problem for him. Rather the meaning of the word 'sum' was for him understood in an indifferent sense (*indifferenten . . . Sinn*), absolutely unrelated to the ego, formally objectified (*formal gegenständlich*), uncritically assumed and therefore not elucidated.¹ From the time of this sketch of an interpretation, Descartes appears as having accentuated the certainty of the *ego* and having simply assumed the *sum* in an uncritical fashion. In other words, the mode of being exemplified by the *sum* is taken in its supposedly most obvious sense, as indisputable and common to all and therefore is in fact thought on the basis of an acceptance of the mode of being which pertains to objects. Descartes emphasizes the question of the *ego* (hence the inauguration of a theory of knowledge) and overlooks the question of the *sum* (hence an objectifying interpretation of every *esse*). Paradoxically, in the eyes of the young Heidegger, Descartes already poses the question of the mode of being of the *sum*, precisely in overlooking it in favour of a question about the status and the power of the *ego*. This confrontation with Descartes, sketched out so early, is more amply developed from the time of Heidegger's residence at Marburg. In fact, this period opens and closes with a course of lectures explicitly devoted to Descartes. In his first winter term (WS 1923/4), Heidegger undertakes an *Introduction to Modern Philosophy* (*Der Beginn der neuzeitlichen Philosophie*); it was supposed to appeal to the figure of Descartes, at least if you are ready to believe the testimony of the last course of lectures given at Marburg in the summer of 1928. 'This course, given in the Summer term of 1928, attempted to come to terms with Leibniz. . . . In my first term at Marburg, 1923/24, I sought to adopt a corresponding position with regard to Descartes, which latter was then incorporated into *Sein und Zeit* (§19–21)' (*Wegmarken*, GA 9, p. 79). It should be emphasized that this last course of lectures not only confirms that the earlier course was devoted to the study of Descartes and, moreover, that it consequently anticipated what was said in *Sein und Zeit* §19–21 but also that it dealt with Descartes in so far as the latter was continued in Leibniz who,

like Descartes, sees in the I, in the *ego cogito*, the source from which all metaphysical concepts have to be drawn. However, with Leibniz as well as with his predecessor (Descartes) and his successors, this return to the I remains ambiguous because the I is not grasped in its essential structure and in its specific mode of being.

(GA 9, pp. 89–90)

From these texts drawn from his period at Marburg, but also from the preceding period one has to conclude – all the more because others will undoubtedly confirm this clear preoccupation – that Heidegger, from the very beginning of his ‘path of thought’ appreciates the importance of Descartes; but he does not attribute it to what, according to the tradition, his contemporaries saw it as consisting in, namely, the establishment of the *ego* upon the plane of a transcendental (or quasi-transcendental) principle. He locates it on the contrary in what Descartes himself conceals behind the evidence and the dignity of the *ego cogito* – in the indeterminateness of the mode of being of this *ego*, whose *sum* remains indeed so indeterminate that it falls under the sway of the mode of being of objects. So Heidegger does not question the *ego cogito* with regard to the primacy of its cognitive origin but rather the ontological indeterminateness of the *esse*, that which it conceals from view rather than that which it proclaims. Thus the encounter with Descartes marks Heidegger’s point of departure more clearly than his other confrontations.

But this stand is also characteristic of his later texts. To limit oneself to one strictly chronological criterion, it should be emphasized that Descartes remains an essential preoccupation right up to the end. (1) In 1969, the second ‘Thor Seminar’ recalls Descartes’ historical position: ‘What happened between Hegel and the Greeks? The thinking of Descartes’; or ‘With Fichte one finds the absolutization of the Cartesian *cogito* (which is only a *cogito* to the extent that it is a *cogito me cogitare*) into an absolute knowledge’ (*Questions IV*, pp. 263 and 282).² (2) In 1973, the ‘Zähringen Seminar’ carries the interpretation of the Cartesian *cogito* to its height on the basis of the question of being:

subjectivity is not itself called in question with regard to its being; since Descartes, in fact, it is the *fundamentum inconcusum*. Throughout the entirety of modern thought, proceeding from Descartes, subjectivity consequently constitutes the obstacle standing in the way of the question concerning being.

(*Questions IV*, pp. 319–20)

(3) In 1974, one of the very last texts, ‘Der Fehl heiliger Namen’ (‘The lack of sacred names’), once more points to this obstacle by taking up again the theme of the first course of lectures at Marburg: ‘At the beginning of modern thought we find/In an orderly manner and before any elucidation of the matter of/the thinking of the *Treatise on Method*:/Descartes’ *Discourse on Method* and the/Regulae ad directionem Ingenii’ (GA 13, p. 233). Even from a chronological standpoint, Heidegger’s thinking constantly comes to terms with that of Descartes, and in a confrontation which is just as constant as that which links him to Nietzsche or Aristotle. This textual fact which confirms the frequency with

which Descartes is cited in the works of his maturity does not nevertheless suffice to elucidate Heidegger's encounter with Descartes. Rather, the very existence of such a confrontation demands to be understood. The abundance and the persistence of Cartesian references only itself becomes intelligible with reference to the concepts which both motivate and justify it. What identifiable conceptual reason leads and constrains Heidegger, from the beginning to the end of his itinerary, to discuss Descartes?

2 The phenomenological motive for the originary confrontation with Descartes

At the very moment when Heidegger was expounding and critiquing Descartes at Marburg, Husserl was expounding and approving Descartes at Freiburg in a course of lectures given in the winter term 1923/4, from which the work *First Philosophy* was drawn. In fact Husserl did not wait as long as this (nor, a fortiori) until the *Paris Lectures* of 1929 to place Descartes at the centre of his reflections; well before *Ideas*, his lectures at Göttingen had already undertaken this task in 1907, as also in other texts.³ Phenomenology, at least in its Husserlian form, had, well before Heidegger, already linked its destiny with the interpretation of Descartes. Nothing of any phenomenological significance could be decided, at least in principle, without a discussion about Descartes. The Descartes that Heidegger encounters enjoys the status of being phenomenologically motivated if not that of being a phenomenologist. At first Descartes appeared for Heidegger in a positively phenomenological light through the intermediary of Husserl. In other words, Husserl's authority, especially after the turn of 1907, had invested Descartes with a phenomenological dignity such that all discussion about Descartes reverts to a discussion with Husserl. More precisely, any discussion of those Cartesian themes which Husserl had sanctified was equivalent to a theoretical discussion with Husserl himself. The equivalence between Descartes and (Husserlian) phenomenology can be deployed in two directions; either Descartes is a phenomenologist because he anticipates Husserl; or Husserlian phenomenology is not fully phenomenological, because it remains trapped in Cartesian positions which have not been criticized, or even recognized. Very early on, Heidegger decides to take the second direction. The distance that he takes up with regard to the Husserlian interpretation of phenomenology will be carried through by way of a critique of the Cartesian presuppositions which lurk in the latter. Descartes will undergo a critique, but a critique which is at first addressed just as much against Husserl who is now regarded as being less of a phenomenologist

in virtue of his Cartesian heritage. So Descartes appears as Husserl's non-phenomenological motif.

Thus, in the course of lectures given in the summer of 1925 and entitled *Prolegomena zur Geschichte des Zeitbegriffs*, Heidegger attempts in §11 an 'immanent critique of phenomenological research', by examining how the latter manages to determine pure consciousness. In other words,

For us, [i.e., Heidegger] the question remains: does the elaboration of the thematic field of the phenomenology of intentionality [i.e., that of Husserl] bear upon the question concerning the *being of this region*, upon the *being of consciousness*; that is, what does being in general mean here when one says that the sphere of consciousness is a sphere and a region of *absolute being*? What does *absolute being* mean here? What does being mean when it is used of the being of the transcendent world, the reality of things? . . . Has phenomenology in general been able to establish the methodological basis to render intelligible this question concerning the *meaning of being*, a question which ought to have been raised first of all and which nevertheless remains unasked? . . . Has the region of consciousness – pure consciousness – been determined in its being as the fundamental field of intentionality, and if so how?!

(GA 20, pp. 140–1)

It should be noted that here, in 1925, Heidegger puts to Husserl and to the region of consciousness the same question and the same critique which he had been putting to Descartes and his *ego cogito* since 1921. Establishing the epistemological priority of the ego and of consciousness constitutes an advance but it does not dispense with the need to determine the mode of being of this first term. Descartes is repeated with Husserl, not only positively, with the bringing to light of the condition of all certainty in knowledge, but also negatively, with the evasive forgetfulness of the mode of being proper to originary certainty. Husserl must certainly have encountered and noted 'an unsurpassable difference of essence' (*ein unüberbrückbarer Wesensunterscheid*; *Ideen I*, §43/Husserliana III, p. 99), 'a genuine abyss of meaning' (*ein wahrer Abgrund des Sinnes*; *Ideen I*, §49/Husserliana III, p. 117) between consciousness and the reality of the world. For all that, is it possible to see this gap as one with 'a necessary and absolute being' (*ein notwendiges und absolutes Sein*; *ibid.*)? In short, is it possible to think an epistemological gap by naming an onto-ontological gap, as if 'the most radical difference in principle between modes of being in general, that between consciousness and reality' (*die prinzipielle Unterschiedenheit des Seinsweisen, die kardinale die es überhaupt gibt, die zwischen Bewusstsein und Realität*; *Ideen*

I, §42/Husserliana III, p. 96) followed from the very fact of the irreducibility of consciousness to what it constitutes? It would have been better if Husserl had not limited himself to repeating the epistemic terms of the opposition – an absolutely certain because knowing consciousness and a reality which is contingent and relative, because known – and undertook instead to work out the respective modes of being of the two terms; for the reasoning he employs to sketch out these two modes of being arises out of a duality – certainty, contingency – which wholly belongs to the mode of being of that very worldly reality and therefore arises out of being being understood as subsisting permanently in the present. Like Descartes, Husserl takes up residence in that sphere of being proper to consciousness, with the result that he evades the supposedly fundamental question of its mode of being. Thus consciousness pays the price, so to speak, of its epistemic priority, with an implicit, but unqualified, submission to that mode of being which belongs to the world. Husserl carries through his abandonment of the question of the being of consciousness by relying implicitly upon Descartes. In fact, he quotes Descartes both to define and to obscure the mode of being of consciousness: 'L'être immanent est aussi indubitablement au sens de l'être absolu en ce que principiellement *nulla "re" indiget ad existendum*' ('Das immanente Sein ist zweifellos in dem Sinne absolutes Sein, dass es prinzipiell *nulla "re" indiget ad existendum*'; *Ideen I*, §49/Husserliana III, p. 115).

Several comments are called for here. (1) Husserl certainly thinks he has defined the mode of *being* of consciousness since he deduces absolute-being from immanent-being. (2) To tie things up, he cites the authority of Descartes, *Principia Philosophia*, I, §51: '*Per substantiam nihil aliud intelligere possumus, quam rem quae ita existit, ut nulla alia re indigeat ad existendum.*' The encounter between these two thinkers certainly cannot be put down to chance since, in addition to their agreement over the epistemic primacy of the *ego*, they also concur in defining the mode of being of the latter by way of substantiality. (3) Husserl, however, modifies Descartes' formula: he omits the *alia* in '*alia re*', and only accepts *res* in inverted commas: '*. . . nulla "re" . . .*' Why? Obviously because *alia* (*res*) would imply that consciousness was itself, and first of all, a *res*; but Husserl precisely intended here to oppose consciousness to *realitas*; he therefore has to contravene accepted philosophical procedure and modify that part of Descartes' formula which would have implicitly extended *realitas* to *res cogitans* to retain only the application of substantiality to the *ego*. (4) This arrangement, and the difficulty which makes it necessary, proves already that Husserl is, in connection with Descartes, employing an insufficient and unadapted determination. For Descartes, in fact, substantiality covers not only the *res cogitans*, but also (though not without difficulty) the whole of *res extensa*, and so

contradicts – rather than confirms – the Husserlian privilege accorded to consciousness: ‘*substantia corporea et mens sive substantia cogitans*’ (*Principia Philosophia*, I, §52). A second contradiction may be added to the first. For Descartes, finite substance, thinking as well as extended, attests to a radical deficiency *vis-à-vis* God, and in such a way that the substantiality which the ego has to share with extension (first disagreement with Husserl), is only valid relative to God and is in no way absolute (second disagreement with Husserl). (5) These differences do not cast doubt on Husserl’s intimate familiarity with Descartes; they prove, on the contrary, that his dependence was much more powerful than any divergence in matters of detail.⁴

An encounter as exemplary as this – Husserl citing Descartes to attempt a determination of the mode of being of consciousness – could not have escaped the attention of Heidegger. In fact, the same lecture course of 1925 takes note of Husserl’s formula and identifies it, with precision, as a recuperation of Descartes. He is therefore able to cast suspicion upon its ontological inadequacy. Immanence, indubitability and absoluteness do not in any way make it possible to think the *being* of consciousness.

This third determination – absolute being – is not, in its turn, to be regarded as determining beings themselves in their being, but as grasping the region of consciousness itself from within the order of constitution and attributing to it, and from within this order, a being which is formally anterior to any objectivity.

(GA 20, p. 145)

The Cartesian distinction does not make it possible to found the difference between the regions – which is itself ontological. Heidegger reduces to nothing both the endeavour and the textual adaptation Husserl imposes upon Descartes’ formula. In this case it is Heidegger who defends the orthodoxy of the Cartesian text and precisely because he stands opposed conceptually to Husserl. There is more, Heidegger continues. Not only does Husserl go astray by taking up again and forcing upon Descartes an inappropriate response, not only does he conceal the authentic determination of the mode of being of consciousness by thinking that a simple recuperation of Cartesian certainty will suffice, but he gets things even more radically wrong by assuming a Cartesian question which has no phenomenological legitimacy.

The first question for Husserl is certainly not that of the character of being of consciousness [*nach dem Seinscharakter des Bewußtseins*], what prompts him is rather the following consideration: *How can consciousness in general become the possible object of an absolute*

science? What motivates him most fundamentally is the *idea of an absolute science*. But this idea that *consciousness has to be the region for an absolute science* is not one which he himself simply discovered but is the idea which had occupied *modern philosophy* since *Descartes*. The working out of pure consciousness as the thematic field for a phenomenology is not arrived at *phenomenologically* by a return to *things themselves* but by a return to a traditional conception of philosophy [*nicht phänomenologisch im Rückgang auf die Sachen selbst gewonnen, sondern im Rückgang auf eine traditionelle Idee der Philosophie*].

(GA 20, p. 147)

Let us assess the extent and the precision of Heidegger's critique of Husserl. (1) The question of the mode of being of consciousness receives no response because Husserl remains dependent upon Descartes. (2) Husserl, in sketching out the authentically phenomenological difficulty of the being of consciousness, emphasizes the non-phenomenological ideal of a certain science of consciousness. We are at this point not very far away from the patricidal declaration launched in this same course of lectures. 'Phenomenology is then, with regard to the duty of determining its own proper field, non-phenomenological!' (GA 20, p. 178).⁵ (3) If Husserl deviates from phenomenology, he does so because of the persistence in him of the Cartesian ideal of a *Mathesis universalis et universalis (sima) sapientia*, so defined in the *Regulae*. From Heidegger's point of view, Descartes therefore plays the unworthy role of obstructing Husserl's path toward phenomenology. Between Husserl and a true phenomenology, therefore between Husserl and Heidegger, Descartes arises as a unique obstacle. The 'affinity' which unites Husserl and Descartes⁶ therefore designates a unique phenomenological obstacle which phenomenology will have to overcome if it wishes to be what it is. Henceforward, to make progress along the phenomenological path which Husserl has abandoned, Heidegger will not merely have to abandon Husserl but 'destroy' what held him to Husserl – Descartes himself.

In this way it becomes possible to understand why Descartes was so important for Heidegger. The chronological importance of the debate which he arouses follows from the phenomenological radicality of the question he poses – precisely by not posing it. To think about Descartes certainly does not mean, for Heidegger, to repeat the *instantiation* of the *ego* as others, like Hegel, Schelling and Husserl, have tried to do in their own way, nor yet to turn it on its head, like Nietzsche, but to destroy it with a view to bringing to light, as the phenomenon which was hidden by it up until then, the mode of being of the *ego* (or of what was supposed to take its place), and in such a way that it can be distinguished from the mode of being of intra-mundane entities. Destroy-

ing the *ego* does not come down to abolishing it ontically but rather undertaking to bring out its ontological dignity – in short, destroying the *ego* opens the way to *Dasein*. In this sense, the importance of Descartes in Heidegger's thinking comes down to his constituting the obstacle *par excellence* standing in the way of the ontological fulfilment of phenomenology. In as much as he stands in the way of the ontological fulfilment of phenomenology with his conception of the *ego*, Descartes makes it difficult for us to appreciate the significance of *Dasein*.

3 The first omission: the indeterminateness of the 'ego sum'

In 1927, and in accordance with what had been sketched out since 1921, Descartes appears, in *Sein und Zeit*, as 'an extreme counter-example' (*Sein und Zeit*, §18/88, 37). By featuring as the extreme counter-example of the ontological problematic of mundanity Descartes pushes phenomenology to its last extremity by misunderstanding the mode of being of worldly beings; but by doing this he calls in question – as we shall see – the mode of being of all beings, beginning with *Dasein*. In fact, 'the interpretation of the world begins in the first instance with some entity within-the-world; so we shall accordingly try to clarify this approach ontologically by considering what is perhaps the most extreme form in which it has been carried out [in seiner vielleicht extremsten Durchführung]' (p. 89, lns 5–7), namely, the Cartesian ontology of the world. In this extremity it is moreover a question of the 'phenomenological destruction of the "*cogito sum*"' (p. 89, ln. 27) which is announced by Heidegger as the third part of his debate with Descartes after §§19–20, sketched out in §21 and referred to the unpublished 'Part Two, Division 2' (p. 89, ln. 28). The objection brought against Descartes applies to two deficiencies, that *vis-à-vis* the world and that *vis-à-vis* the *ego*, both of whose modes of being fall short, though in a different way. It should also be noted that the objection brought against Descartes precedes the celebrated analysis of the *res extensa* of §§18–21,⁷ where it only finds a first confirmation though it appears initially with reference to the *cogito sum* and right from the Introduction to *Sein und Zeit*. This is valid, let us remember, for the entire plan announced in §8 and therefore for the part which remained unpublished. The principle which introduces subjectivity into the whole of modern philosophy has two characteristics: it claims to bring about an absolutely certain beginning and, at the same time, thinking about being is not to be found there in as much as the *esse* is masked by the *sum* and so remains unthought in the shadow cast by the *ego*, the only thought in evidence.

Since, in the course of this history certain distinctive domains of

Being have come into view and have served as the primary guides for subsequent problematics (Descartes' *ego cogito*, the subject, the 'I', reason, spirit, the person), these regions, in conformity with the thoroughgoing way in which the question of Being has been neglected, remain unquestioned as to their being and the structure of their being. (§6/H. 22, lns 13–18)

Or again:

In taking over Descartes' ontological position Kant made an essential omission [*ein wesentliches Versäumnis*]: he failed to provide an ontology of *Dasein*. This omission was a decisive one in the spirit of Descartes' ownmost tendencies. With the '*cogito sum*' Descartes had claimed that he was putting philosophy on a new and firm footing. But what he left undetermined [*unbestimmt*] when he began in this 'radical' way was the kind of Being which belongs to the *res cogitans*, or – more precisely – the meaning of the Being of the '*sum*'. By working out the unexpressed ontological foundations of the '*cogito sum*', we shall complete our sojourn at the second station along the path of our destructive retrospect of the history of ontology. Our interpretation will not only prove that Descartes had to neglect [*versäumen*] the question of Being altogether; it will also show why he came to suppose that the absolute 'Being-certain' of the *cogito* exempted him from raising the question of the meaning of the Being which this entity possesses.

(§6/H. 24, lns 16–29)

A number of remarks should be made at this point. (1) §6 of *Sein und Zeit* calls Descartes in question firstly, and before all else, on the grounds of the meaning of the being of the *sum*; or rather, the Cartesian omission of the meaning of being in general is noticeable first and foremost with regard to the *ego cogito*; only the order in which the first part is arranged and the absence of the second part can convey to the reader the feeling that Heidegger emphasizes the doctrine of *res extensa* in his debate with Descartes. (2) However, the *ego cogito* and the *res extensa* furnish the phenomenological destruction undertaken by *Sein und Zeit* with two comparable 'omissions': Descartes misconstrues the mode of being of the *ego*, because he holds to the certainty of its existence without distinguishing such an epistemic category from an ontologically determinative existential; if he holds here to the idea of certainty, it is because he is going to transpose it over to the *ego* on the basis of that domain where it has first been demonstrated as an object of a methodical science, namely, extension; for if, epistemically speaking, the object depends upon the *ego*, at least with regard to this tacit and indecisive (let us call it nebulous)

ontology, the *ego* borrows its own interpretation as certain from the *res extensa*. In any case, the two 'omissions' go together and display the same inadequacy: the indeterminateness of the meaning of being. (3) The two dimensions of this peculiar inadequacy exactly anticipate the two regions distinguished by Husserl: the absolute region of consciousness, the relative region of the things of the world. And, just as Descartes fails to think them as such, Husserl also fails to think their respective ontological meanings. It is therefore quite in order to treat and spell out these two deficiencies brought by *Sein und Zeit* against Descartes as two integral parts of the 'destruction' of the history of ontology; so, positively speaking, as a breakthrough beyond the phenomenological obstacle presented by Descartes.

Usually presented as the thinker of the *cogito sum*, Descartes could more properly be seen as incapable of thinking this same *cogito sum*, or at least of thinking the *sum* on the basis of the *esse*; for Descartes reduces the *sum* to the *cogito* and the *cogito* to the *ego*. The *ego* itself can only be characterized by an epistemic determination – that of a first and absolutely certain principle which renders possible any knowledge of other beings. Proceeding from beings which are known to the knower, the extension of this certainty is only able to satisfy the requirements of a method through a procedure of generalization by leaving indeterminate and in the shade the question of the meaning of being for the *ego*. This indeterminateness marks Descartes' first and most radical omission: 'a total ontological indeterminateness with regard to the *res cogitans sive mens sive animus*' (§6, pp. 24, 31); or again:

Descartes, to whom one attributes the discovery of the *cogito sum*, as the point of departure for all modern philosophical questioning, examined – within certain limits – the *cogitare* of the *ego*. By contrast, he leaves the *sum* completely unclarified [*unerörtert*], even if he can be regarded as having posed the *sum* on as original a plane as the *cogito*.

(§10/455, 39–46, 4)

In condemning such a lack of determinateness, Heidegger is not contesting the certainty of the knowledge of the *cogito qua cogito*; it is even very remarkable that he does not get involved in the fashionable, though idle and facile, debate about the legitimacy of the reasons which led to a demonstration of the original, absolutely indubitable and necessary, existence of the *ego qua cogito*. Heidegger's critique bears on another point altogether: does the epistemic certainty which offers the *ego* as the first certain object for a knowledge of what in fact it is itself suffice for an ontological determination of its own proper mode of being? By his very silence on this point Descartes lays claim to the univocal character

of certainty (which keeps the same meaning and validity when it is transferred from known objects to the knowing subject). But this univocality is only founded (moreover as the medieval *univocatio entis*) upon an entrenched indeterminateness; better: this certainty remains not merely ontologically indeterminate but entirely indifferent to the question of the various modes of being of the meaning of being. Descartes assumes first of all that this certainty applies in the same way to the entire (though heterogeneous) series *cogitatum-cogitato-ego*. But he simply assumes that, just as the *cogitatum* is, in the light of the nebulous ontology of the *Regulae*, supposed to find the concrete determination of its mode of being in certainty, the *ego* too requires no other determination of its meaning of being than this same certainty, purely and simply. The certainty of the *ego cogito* does not therefore do away with the indeterminateness of the *sum* nor of the *esse* but simply reinforces it. This evident certainty allows Descartes to abandon any interrogation on the mode of being implied by this very certainty and results in its meaning of being being regarded as obvious, self-evident. '*Nota est omnibus essentiae ab existentia distinctio*' (Adam and Tannery (AT), VII, 194, 12), was his response to Hobbes. Descartes not only misses the question of the meaning of being, he masks this very omission by remaining blind to the epistemic evidence of the *cogito*. Descartes' first omission consists in his having left himself out of account.

This failure to come to terms with an omission finishes up however by deciding the mode of being of the *ego*: if Descartes fails to think his *sum* as such he still does think it implicitly on the model of intra-mundane being and in accordance with a reflective (*Rückstrahlung*) comprehension of the world on the basis of the explication of *Dasein* (§5/16, 1), for '*Dasein* is inclined to fall [*verfallen*] into the world in which he finds himself and to interpret himself reflectively [*reluzent*] on its basis' (§6/21, 11–12).⁸ By virtue of the failure of any approach to the meaning of the being of the *ego*, the mode of being of intra-mundane beings becomes the attractive and interpretive pole of the mode of being of non-intra-mundane beings. The Cartesian *ego* (as also its substitutes and derivatives throughout the entire metaphysical tradition right up to its Husserlian avatar) differs essentially from *Dasein* in this: it is not seen to exist and therefore is not thought in accordance with its own proper mode of being but is always, and from the first, distorted by those intra-mundane beings from which it quite improperly borrows its own mode of being.

4 The second omission: the permanence of intra-mundane beings

But the impropriety has now been reduplicated. For, just as the Cartesian interpretation of the *ego* fails to take account of its manner of being and

also fails to understand this omission, so the absence of this interpretation condemns the *ego* to being swallowed up in the mode of being of intra-mundane beings to which moreover it does not belong in principle, with the result that the interpretation of the manner of being of intra-mundane beings fails, with Descartes, to take account of the phenomenon of the world by replacing the latter with the univocal and minimum subsistence of what lies at hand (*Vorhandenheit*). In accordance with an analysis as celebrated as it is ambiguous and ephemeral,⁹ the mundanity of the world is manifest less by the subsistence of being at hand (*vorhanden*) than by their interplay as instruments, handy and ready-to-hand (*zuhanden*); in this interplay, a being is defined by what it is used for (*um . . . Zu*), and with regard to an end which, under the diverse aspects served by interests, utility, function, organization, etc., etc., ultimately depends upon that 'to which it returns' (*Bewandnis*), therefore, to *Dasein* itself, which, in this way, opens the way to the world in its mundanity. The subsistence of the present-at-hand (*Vorhandenheit*) only follows from *Zuhandenheit* by way of a deficiency and impoverishment of the ready-to-hand and in response to theoretical demands alone. The object required by the theoretical attitude can only remain isolated as an atom of evidence persisting in its perfect subsistence, neutralizing all finality in its pure objectivity. The object of the theoretical attitude is obtained through just such a methodological reduction and abstraction. It does not precede what is utilizable and ready-to-hand but follows it through an impoverishment and elimination. This operation which inverts the phenomenological pre-eminence of the *Zuhandenheit* over the *Vorhandenheit* comes from Descartes. The privilege which this method accords to mathematical knowledge does not rest, for him, upon the intrinsic excellence of this science but upon its ability to attain the certainty and the permanent subsistence of an object. The primacy accorded to mathematics follows, according to Descartes, from the privilege accorded from the first to the permanent subsistence of an objectivity whose certainty is the very meaning of the being of intra-mundane beings.

If anything measures up in its own kind of Being to the Being that is accessible in mathematical knowledge, then it *is* in the authentic sense. Such entities are those which always are what they are. Accordingly, that which can be shown to have the character of something that constantly remains (as *remanens capax mutationum*), makes up the real Being of those entities of the world which get experienced. . . . The kind of Being which belongs to entities within-the-world is something which they themselves might have been permitted to present; but Descartes does not let them do so. Instead, he prescribes for the world its 'real' Being, as it were, on the basis of an idea of Being whose source had not been unveiled and which had not been

demonstrated in its own right – an idea in which Being is equated with constant presence-at-hand.

(§21/95, 36–96, 12)

‘The constant presence-at-hand of things’ (*ständige Dingvorhandenheit*; 99, 15) is only able to fix the meaning of the being of intra-mundane beings by degrading it to something which is susceptible to certainty and this at the expense of the phenomenality of the world. The interpretation of being in general as the permanent subsistence of the present-at-hand not only misses the meaning of the being of the *ego* by leaving its *sum* undetermined as such; it also, and before all else, misses the meaning of the being of those intra-mundane beings with regard to which, nevertheless, it claims to provide the perfect knowledge. These two limitations meet in a common and more original inability to think the being of beings in general.

What assessment could the historian of philosophy – if perchance he were able to detach himself from the philosopher – give to such an analysis and ‘destruction’ of Descartes? Without anticipating a more extensive discussion which would have to be conducted in another context, we will stick here to three remarks.

(1) Heidegger confirms that *ständige Vorhandenheit* obscures and monopolizes the meaning of being by relying on the Cartesian interpretation of *res extensa* as *substantia*, itself reduced to what *remanet* (= *verbleibt*) in every reduction (according to AT, VII, 30, 19 and on and *Principia Philosophiae*, II, §4, cited in *Sein und Zeit*, §§19 and 21). This reference is obviously very correct. However it hides another reference which attributes permanence (*remanet*) first to the *ego* and before the *res extensa* itself. For before asking ‘*Remanetne adhuc eadem cera?*’ and replying ‘*Remanere fatendum est*’ (*Meditatio II*, AT, VII, 30, 19–20), therefore before encountering the *res extensa* (which, it should be said, does not yet appear in the analysis of the piece of wax), Descartes had already reduced the *ego* to the *cogito* ‘*ut ita tandem praecise remaneat illud tantum quod certum est et inconcussum*’ (AT, VII, 25, 22–4). If permanence characterizes certainty as a (failed) manner of being, it should have been introduced with the first certainty and it is therefore with regard to the *ego cogito* that the diagnosis of permanent subsistence should have been conducted. Each time that it thinks, the *ego* remains. Such an omission of a Cartesian reference is surprising when it comes from so precise a connoisseur of Descartes as Heidegger, and all the more so since this first ‘remaining’ confirms, rather than the reverse, the general thesis advanced by *Sein und Zeit*. *Vorhandenheit* not only determines intra-mundane being but, through a species of reflection (*Rückstrahlung*), flows back upon the *ego* itself and closes it off from all access to its true being. It could be objected,

and quite rightly, that since §§19–21 only deal with the kind of mundanity that is missing in Descartes, they are not required to mention a text dealing with the *Vorhandenheit* of the *ego*. If this reply is admitted however, another question arises. Did Heidegger not make use of the ‘remaining’ of the *ego*, established in AT, VII, 25, 22–3 in the second part, section 2, devoted to the ‘ontological foundations of the “*cogito sum*”’ (§8/40, 4)? But this hypothesis would imply that he took advantage of a text which supported it at the very moment when he ignored it!

(2) The omission of the meaning of being in general is marked, in Cartesian texts, by the inadequacy of the doctrine of substance. Heidegger pertinently points out that substance is not supposed to affect us directly: ‘*non potest substantia primum animadvertit ex hoc solo, quod sit res existens, quia hoc solum per se nos non afficit*’ (*Principi Philosophia*, I, §52, cited §20/94, 4–6). Thus, the inquiry into the nature of substance is, from the first, diverted into an inquiry into its principal attribute, which itself remains unknown in principle. There follows a radical ‘equivocation’ about the term (§20/94, 27; §19/20, 2), in the course of which its ontological is confused with its ontic meaning, with a view to circumventing the former that much more easily and taking refuge in the treatment of the latter.

The debate about the distinction between finite and infinite substance, a debate to which Descartes accords a primary importance, only succeeds in reinforcing this basic orientation towards the ontic meaning of the term *substance*. The Cartesian treatise on substance in *Principia I*, §§51–4 totally ignores Aristotle’s discussion about the οὐσια, which is at least ontological in intent. For the most part this reproach, brought by Heidegger against Descartes, seems justified.¹⁰ The debate is deepened with a second, less visible but more important criticism. In bringing what is ontological in *substantia* under the ontic, Descartes necessarily confuses the ontological difference:

Because something ontical is made to underlie the ontological, the expression ‘substantia’ functions sometimes with a signification which is ontological, sometimes with one that is ontical, but mostly with one that is hazily ontico-ontological. Behind this slight difference [*Unterschied*] of signification however, there lies hidden a failure to master the basic problem of Being.

(§20/94, 29–33)

To this *grundsätzlichen Seinsproblem*, Heidegger adds, in a note to his personal copy, a simple formula: *ontologische Differenz* (ibid.). A decisive addition! For it shows that by obscuring the ontological in *substantia*, Descartes prompted the very apriori in which Husserl remains trapped in as much as he thinks it possible to distinguish substances (or ‘regions’)

solely on the basis of ontic criteria, that is, without undertaking to distinguish (ontologically) their respective modes of being. Finally, he shows that Descartes failed to confront the difference between being and beings, the only difference which would have made it possible for him to fix ontologically the distinction between beings and substances. The convergence between these two shortcomings – the meaning of the being of the *ego* and the meaning of the being of intra-mundane beings – results from the original evasion of the ontological difference. The reintegration of Descartes in the history of metaphysics by way of what in *Sein und Zeit* is still only called a ‘destruction of the history of ontology’ (§6), is supposed to bring to light in him the essential feature of metaphysical thinking: that it fails to come to terms with the difference between being and beings. Since, in *Sein und Zeit*, this difference still remains implicit, even though it is effectively operative, it only represents an objection to Descartes under the form of the two omissions with regard to the meaning of the being of beings. This does however suffice to trace the phenomenological inadequacies of Husserl back to their genealogical source in the Cartesian ontology – something that had to be demonstrated.

(3) Could one not, nevertheless, bring against the analysis of *Sein und Zeit*, the objection that Descartes did indeed work out a theory of the world? Surely the mundanity of the world first becomes an explicit problem when the *ego* asks itself whether it is not alone in the world, ‘*me solum esse in mundo*’ (AT, VII, 42, 22), and then again when he undertakes to prove its existence in *Meditatio VI*? These two references only however suffice to draw an argument in favour of the thesis upheld by *Sein und Zeit*. In the first case, the *ego* only eventually accedes to other beings on the basis of itself, that is to say, on the basis of the ideas which it is capable of entertaining with regard to those beings. Thus they are represented as determined in advance *qua* certain objects, therefore in accord with subsisting persistence (*Vorhandenheit*). God does not constitute an exception to this determination and, symptomatically, there is no place for the other to be found therein.¹¹ In the second case, the very fact that the ‘existence of the external world’ has to be proved constitutes – more the absence of a convincing proof of which Kant complained in taking up the Cartesian theme (§43/204, 9 and 25) – the true phenomenological ‘scandal’. For the world can only owe its existence to such a proof in as much as it is first reduced to the status of a presentation standing in need of realization, that is, of *Vorhandenheit*. Proving (or not) the existence of the world presupposes that one had already missed the mundanity of the world – i.e., its appearance within the phenomenological horizon.

These two Cartesian omissions therefore really come down to one – that of having grasped ‘the being of “*Dasein*” solely in the mode of the

being of the *res extensa*, as substance' (§21/98, 7–10). And it is from this standpoint that he addresses Kant.

The 'consciousness of my *Dasein*' means for Kant: consciousness of being being present-at-hand [*Vorhandenheit*] in Descartes' sense. The term '*Dasein*' therefore designates just as well the being present-at-hand of consciousness as it does that of things [*sowohl das Vorhandenheit des Bewußtseins wie das Vorhandenheit der Dinge*].

(§43/203, 25–8)¹²

5 *Dasein* as the 'destruction' of the *ego cogito*

Descartes' two omissions with regard to the thinking about being can be traced back in the end to one unique incapacity to think the being of beings outside the context of *Vorhandenheit* which, in turn, results from a misunderstanding of the ontological difference – at least in so far as it is taken in accordance with its negative formulation: 'Being can never be explained in terms of beings' (§43/203, 3–4).¹³ The *ego* is set up by Descartes, and after him by Kant no less than by Hegel, as a privileged being with a view to rendering other beings intelligible and to taking account of the meaning of being to be found in them, in short, to furnishing them with an ontic guarantee and an ontological legitimacy. But at the same time, and to an ever increasing extent, the meaning of that being which belongs to it remains completely undetermined. The indeterminateness of the mode of being of the *ego cogito* invades every other being and takes away from them their ontological solidity – 'the absence of any ontological ground [*ontologische Bodenlosigkeit*] for the problematic of the self [*Selbst*] from the time of Descartes' *res cogitans* to Hegel's concept of spirit' (§64, n. 1/320). In other words,

'if idealism' signifies tracing back every entity to a subject or consciousness whose sole distinguishing features are that it remains *indefinite* in its Being and is best characterized negatively as 'un-Thing-like', then this idealism is no less naive in its method than the most grossly militant realism.

(§43/208, 6–11)

In consequence, what separates Descartes (and those he made possible) from the question about the meaning of being is what separates the *ego cogito* from *Dasein*. *Dasein* recovers in it an echo of what the *ego (cogito)* already exhibits. *Da-*, there, this unique spot where everything else can consequently take place; but with the *ego cogito* the everything else only has the status of *cogitatum* because I am limited, *qua ego*, to the *cogitare*.

By contrast, on the basis of *Dasein*, the *Da* imparts upon everything else nothing less than *Sein*, being. There where the *ego* invites thought or rather lets itself be thought (even to turn itself into a simple thought) without ever giving rise to being in any determined or determining sense, *Dasein* gives being by determining the manner of being of other beings, since in advance, and by right, it determines itself to be according to its own proper manner. The *ego* certainly *is* but it is without thinking about itself since it only thinks of thinking the thinkable whose respective manner of being is no more fixed than its own. By thinking about itself as only being through and for the exercise of the *cogitatio*, it masks the complete absence of any decision with regard to the being of beings (reduced to the status of pure and simple *cogitata*) first by way of the epistemic evidence of its ontologically mobile existence and then by way of the certainty of the other truths. *Ego cogito*, not *ego sum* still less *Dasein* – the very formula betrays the indeterminateness which both disqualifies Descartes ontologically and accounts for the two omissions for which he is responsible. Henceforward, any interpretation of Descartes to be found in *Sein und Zeit* will have to be thematized solely in line with this opposition between the *ego cogito* and *Dasein* and in conformity with the declaration in principle that ‘the *res cogitans* is neither ontically nor ontologically equivalent to *Dasein*’ (§14/66, 27–8).

It only remains to develop these oppositions. With regard to the first, the *res cogitans* is not ontically equivalent to *Dasein* since the *res cogitans* possesses only an ontic awareness of itself and since *Dasein* does not think of itself (from the point of view of the *res cogitans*) as being itself another *res cogitans*. Although this opposition is never explicitly developed by Heidegger, it can easily be reconstituted in at least three steps. (1) The *ego* is a thing which shares the realitas of intra-mundane beings whether ready-to-hand or present-at-hand; by contrast, ‘the being of *Dasein* has at the same time been distinguished from [*abgegrenzt gegen*] the modes of being (ready-to-hand, present-at-hand, reality, *Zuhandenheit*, *Vorhandenheit*, *Realität*) which characterize entities with a character other than *Dasein* (§44/230, 18–20). The *res* of the *ego* leads to the Husserlian difficulty of effectively distinguishing the region of consciousness from the region of the world. *Dasein* cannot be counted among the number of real things nor does it admit reality into itself since it precedes and renders possible the very mode of being of reality. (2) The *ego* can be defined in terms of the absolute primacy in it of the theoretical attitude. It is born out of doubt, but this doubt does not itself become applicable until every immediate relation (whether pressing, useful or necessary) has disappeared: ‘no conversation . . . no care nor passion’ (AT, VI, 11, 8, 9–10), ‘*curis omnibus exsolvi*’ (AT, VII, 17, 13–18, 1). By contrast, ‘scientific research is not the only nor even the most proximate mode of being of this entity (sic *Dasein*)’ (§4/11, 35–6).

In fact, *Dasein*'s relation to the world is based upon concern, a concern which manipulates and utilizes beings as ready-to-hand, therefore without the least trace of disinterest. *Dasein* arrives at a theoretical attitude only later and by a procedure of subtraction. 'If knowing [*Erkennen*] is to be possible as a way of determining the nature of the present-at-hand by observing it, then there must first be a *deficiency* in our having-to-do with the world concernfully' (§13/61, 26–8). *Dasein* is not limited to adopting the theoretical attitude by challenging the so-called 'natural' attitude (in fact, concerned utilization of being as ready-to-hand), but both establishes and surpasses the one and the other because, more radically still, it makes them possible. (3) Finally, the *res cogitans* is confined to the domain of the *cogitatio* and devolves upon the other *res* that of *extensio*, this in accordance with an almost irremediable split. As a result, the *res cogitans* slips out of space – which also slips away from it. Because *Dasein*, on the contrary, is not defined from the first by the representation of what is present-at-hand (*vorhanden*) it does not exclude the disclosure of a fundamental spatiality. The 'spatiality of *Dasein*' (§23/104, 33) is based upon the de-severing (*Entfernung*) by means of which it abolishes the distance between an entity and itself. This same abolition of the distance, or deseverance, qualifies the original ekstasis of *Dasein*, its being-in-the-world. By contrast with the subject of idealism, based upon the *ego cogito*, 'the ontological "subject" properly so called, namely *Dasein* . . . is spatial' (§24/111, 33–4). *Dasein* is neither non-extended in the manner of the *ego cogito* nor extended: it is spatial, not non-extended. Thus, by refusing to take over the common title of *res*, *Dasein* is not constrained *vis-à-vis* the *res cogitans* but, on the contrary, surpasses it by not allowing itself to be limited either by the theoretical attitude or by the non-extended. This merely confirms that, taken as an entity, *Dasein* does not coincide with the *res cogitans*.

But since the 'ontic characteristic of *Dasein* consists in this, that it is ontological' (§4/12, 11–12), its ontic opposition to the *res cogitans* can only prepare the way for the ontological opposition which distinguishes it from its opposite (this time on the basis of itself and not its opposite). Undoubtedly the *res cogitans* can lay claim to a multiple 'primacy' but not to just such an 'ontological primacy'. On three points at least the opposition between them becomes irreducible.

(1) With regard to *Dasein*, its being is at issue; this being has to decide about its very own being and, in this decision, not merely its own (mode of) being is at issue but being pure and simple, therefore the mode of being of other entities which, for their part, are incapable of deciding either about themselves or about anything else (§4/12, 4–12; §9/41, 28–42, 2, etc.). *Dasein* enters into a surprisingly uncertain relation with itself. So very far from being reassured about itself by coming to know itself

as such, it only knows itself by coming to terms with the game that is being played with regard to itself – the game of its being that being whose being is at stake and which always has to decide with regard to this privileged being. *Dasein* only knows itself authentically when it recognizes that its being is in question, undecided and all the more uncertain for being placed beyond the possibility of certainty. *Dasein* is at stake. And such a stake is, in the end, beyond both uncertainty and certainty and definitely sets *Dasein* in opposition to the *ego cogito*. Undoubtedly, Heidegger is wrong textually to characterize it as a *fundamentum inconcussum* (§6/24, 34–5); however, Descartes does indeed see in it a ‘*fundamentum, cui omnis certitudo niti posse*’ (AT, VII, 144, 24–5), ‘quite firm foundations’ (AT, VI, 31, 18–19); and Descartes certainly wants to see it as unshakeable: ‘*minimum quid . . . certum et inconcussum*’ (AT, VII, 17, 7). More, the *ego* itself immediately takes on the figure of a foundation, better of an autarchic and self-sufficient foundation: ‘a foundation which is entirely my own’ (AT, VI, 15, 6). In thinking itself, the *ego* takes hold of itself and makes itself its own; not only is all uncertainty thereby surpassed but the certainty of the foundation, which is henceforward definitive, extends to every other *cogitatum* to come. The *ego* certainly decides about itself but only to abolish any play in this its own self-certainty. And if the *ego* decides, in the future, about other entities, it will only be to reduce them, as so many *cogitata*, to its own certainty. Thus *Dasein* does indeed inaugurate a game, that of the being of other entities through its own, there where the *ego* closes off all uncertainty, first of all in itself, then in the *cogitata*.

(2) *Dasein* exists, but existence is defined as possibility: ‘*Dasein* always comports itself on the basis of its existence, of a possibility of itself to be itself or not to be itself’ (§4/12, 25–6). Existence signifies: being outside oneself, and in such a way as only to be in the mode of a possibility of being and in accordance with the stake which brings this entity into a play with its being, therefore with being itself; existence implies the ekstasis of a *Dasein* thrown out of itself in the play of being, with regard to which it is up to him to decide. When the *res cogitans* takes hold of itself with certainty by saying ‘*ego sum, ego existo*’ (AT, VII, 25, 12–27, 28),¹⁴ it immediately interprets its *sum*, therefore its being, as an existence. Could this be the kind of existence which characterizes *Dasein*? On the contrary, Heidegger insists:

when we choose to designate the Being of this entity (sic *Dasein*) as ‘existence’ this term does not and can not have the ontological signification of the traditional term ‘*existentia*’; ontologically, *existentia* is tantamount to Being-present-at-hand, a kind of Being which is essentially inappropriate to entities of *Dasein*’s character.

(§9/42, 8–12)

Does one have to prove that Descartes, in fact, means by *existentia* the counterpart of a simple essential possibility, which is abolished by certain and unequivocal permanence? He himself does not even bother to define existence considering, as he does, that it is self-evident. '*Neminem enim unquam extitisse tam stupidum crediderim, qui prius quid sit existentia edocendus fuerit, antequam se esse concludere potuerit atque affirmare*' (AT, X, 524, 10–13). For the *ego cogito*, *existentia* implies the inauguration of the *Vorhandenheit*; for *Dasein*, existence signifies the abandonment of self and a surpassing of *Vorhandenheit* with a view to entering into that possibility which it is definitively.

(3) Finally, 'to *Dasein* there belongs essentially being-in-the-world' (§4/13, 12–13). Contrary to the Husserlian limitation, intentionality is not confined to the theoretical attitude because the relation to the world does not concern, first and foremost, the constitution of things. Intentionality is enlarged and radicalized to the point at which, in advance and out of itself, it opens up the 'I' upon something like a world. This is the only way in which it is possible to move from one entity to the being of all the others. This critique of Husserl which plays an important part in the composition of *Sein und Zeit* and which is to be found throughout the text is also valid of Descartes, on account of the 'affinity' which unites them. Descartes in fact reaches the *ego cogito* on the basis of a hypothesis with regard to his independence *vis-à-vis* the entire possible world. The *ego* appears in fact when, and only on condition that, worldly beings disappear under the sway of hyperbolic doubt. The *ego* is defined as follows: 'a substance whose entire essence or nature consists solely in thinking, which is not located anywhere and which does not depend upon any other material thing' (AT, VI, 33, 4–7). Heidegger is perfectly justified with reference to Husserl and to Kant (and therefore also Descartes) in talking of a 'worldless "I"', '*weltlose Ich*' (§63/316, 1), of a 'worldless subject', '*weltlose Subjekt*' (§75/388, 23). The classical difficulties of an opening on the world from a Cartesian standpoint do not have to be recalled here. They simply confirm the diagnosis made by Heidegger. Thus *Dasein* is certainly not to be found in the *res cogitans* since the *ego* can be defined as the very opposite of *Dasein*, an entity whose being is not in question. Reciprocally, *Dasein* can be defined as the very opposite of the *ego cogito*: that entity which is *not* in so far as it thinks. With regard to the *ego cogito*, *Dasein* therefore undertakes a relation of 'destruction'.

6 *Dasein* as the 'confirmation of the *ego cogito*'

Such a relation of destruction would however be pointless if an ontology could not be found in the *ego*, limited as it is to thinking. For the

'destruction' always bears upon the 'history of ontology'. So some kind of metaphysical situation has to be imputed to the ego, a situation which inserts it into the history of a misunderstood ontological difference. The reappraisal of the *ego cogito* follows therefrom since it still exhibits a figure of the being of beings, even though only in an obscure and forgetful manner. But this historical (historicist rather) imputation would not enjoy any legitimacy if the *ego cogito* could not justify its ontological pertinence even inauthentically and obscurely, not just in the course of the history of ontology but in the 'new commencement'. Even if only to retain its hermeneutical role in metaphysics, the *ego* has to hold on to and reserve for itself a potentiality for being. We shall therefore have to examine *Sein und Zeit* to see if it does justice to these two postulates concerning the *ego cogito*.

From the – dominant – point of view of his 'shortcoming', the Cartesian *ego* finds itself unable to manifest the meaning of being, a property which characterizes *Dasein* alone. The ontico-ontological antagonism between the *ego cogito* and *Dasein* appears sufficient (§5) to permit us to balance it out (without either insisting upon it or weakening it) by taking note of another relation between these same antagonists. To be sure, the *ego cogito* is presented as the most extreme adversary of *Dasein*. However, *Dasein* would not be engaged in so urgent a task of destruction if certain of its very own characteristics could not be found therein. It is in fact impossible for *Dasein* not to recognize itself in at least four characteristics of the *ego cogito*, and this in accordance with a spirit of rivalry which is all the more disturbing for being aggravated by these very similarities:

(1) *Dasein* 'does not come to an end [*Ende*] when it simply ceases, but it exists in a finite manner [*existiert endlich*]' (§65/3209, 37–8); finitude cannot be added as something extrinsic to an existence which, for this reason, would not enjoy an infinite (*endlose*) duration; it provides an essential determination for a *Dasein* which exists only for a term, for a death which comes to it out of the future; in as much as it marks the being-toward-death of *Dasein*, finitude opens the way to its own ekstasic temporality through the primacy of the figure which stands opposed to that temporality of *Vorhandenheit* which accords the primacy to the present as enduring. But the *ego cogito* is also characterized by finitude: '*cum sim finitus*' (AT, VII, 45, 21): this latter finitude does not simply possess an anthropological function (the *ego* must die, it is lacking in perfections, etc.), but quasi-ontological, for it is in fact this finitude which provokes doubt, therefore brings out the *cogitatio* which, in turn, institutes the beings of the world as so many *cogitata* to be constituted; for this reason, the finitude of the *ego* determines the meaning of the being of beings other than the *ego*. The relevance of this connection certainly remains hidden to and by Heidegger since he only envisages

the finitude of the *ego* in the horizon of a 'Classical-Christian anthropology' (§10/48, 27)¹⁵ and so reduces the relation between finite and infinite substance to an efficient production, with a view to refusing all originary validity to Cartesian finitude. It still holds however that the *ego* can only establish the beings of the world as *cogitata* (either on the basis of itself *qua cogito* or indissolubly), because it exists in accordance with an essential finitude. Furthermore, the later mediation developed by Heidegger on the *cogitatio* – Representation, *Vorstellung* – will continue to develop this implication. So *Dasein* confirms the *ego* from the standpoint of finitude.

(2) *Dasein* is the being whose being is in question only on condition that this being is its own, in person: 'its essence consists much rather in this that each time it has its being to be as its own [*es je sein Sein als seiniges zu sein hat*]' (§4/12, 22–3); or again:

That Being which is in issue for this entity in its very Being is in each case mine. . . . Because *Dasein* has in each case mineness, one must always use a *personal* pronoun when one addresses it: 'I am', 'you are'.

(§9/42, 23–9)

Dasein could not be itself, that is, be that very own being whose being is in question, save in a personal way. Nobody can take the place of *Dasein*; *Dasein* cannot stand in for anyone else; even if it's you who are *Dasein*, this *you* will have to say 'I' of itself, just like myself; even and even especially if the role of *Dasein* is played by someone else, this role must be played in the first person because it has to be played *in person*. Thus, even if *Dasein* does not call itself an *ego cogito* at first, it can only say, *-sein* by saying '*Ich bin*', therefore '*ego sum*'. Thus *Dasein* inevitably talks of itself, at least in the first instance, as an *ego cogito*: '*ego sum*' (AT, VII, 25, 12 = 27, 9), '*je suis*' (AT, VI, 32, 19 = AT, II, 38, 9–10 = AT, III, 247, 2, etc.). This comparison seems absolutely decisive. In fact, Descartes did not simply inaugurate the liaison between the *cogitatio* and existence in a 'subject'; he linked them in a 'subject' which is itself always interpreted (in the theatrical sense of that term) in the first person, or better, in a personage (*persona*, in the theatrical sense) which has to be played in person (again theatrical in that it assumes the function of an 'I' – by saying 'I', *hoc pronuntiatum*, *Ego* (AT, VII, 25, 11–12). Descartes' successors will tend, on the contrary, to eliminate this engagement of and to the ego; or rather, to replace the first formula with another which nobody has to perform in person: '*sum cogitans*'; or again, they will abolish it altogether either by the way of subtraction (Malebranche), or by that of generalization (Leibniz). What distinguishes Descartes is therefore not simply the necessary liaison he establishes

between two simple natures (*cogitatio* and *existentia*) but, more particularly, the performance of this necessary link between them by the non-substitutable *ego*. In this respect he exactly reproduces the non-substitutability which characterizes *Dasein*. So *Dasein* confirms the *ego* from the standpoint of mineness (*Jemeinigkeit*).¹⁶

(3) The finitude and non-substitutability of *Dasein* comes to it from the fact that it is in such a way that its being is an issue for it; this manner of being belongs to it in virtue of its being-toward-death, for death is the ownmost, the most absolute and the least surpassable possibility. In fact, 'death is the possibility of the pure and simple impossibility of *Dasein*' (§50/250, 39–40). Faced with death, *Dasein* finds itself exposed to its own, last impossibility, partly because death is inconceivable to us ontically (unimaginable), partly because death brings to an end that very possibility which *Dasein* is (more even than the possibility of its doing this or that). But the *ego cogito* knows a similar paradox, not with regard to its death but with regard to its liberty. For possibility arises in Cartesian terms with absolute freedom, the only infinity formally located in the finite *res cogitans*. The impossibility of this absolute freedom becomes apparent when it confronts divine omniscience and omnipotence, which latter destroy the very notion of the possible. In such an encounter the *ego cogito* not only confronts the impossibility of that possibility (liberty) which the theory requires of it; it also confronts the possibility of impossibility since, in the practical order, it decides to act as if it could act freely even though it is incapable of comprehending such a possibility. In each action, the *ego cogito* acts as if it were free and as if the impossible (an event not necessarily pre-determined by God) became once again open to possibility.¹⁷ The possibility of the impossible applies therefore to liberty just as it does to being-toward-death. Thus, once again, *Dasein* confirms the *ego* as the possibility of impossibility.

Even if one concedes the textual basis of these comparisons, they will appear superficial and even pointless considering the gulf (both ontological and ontic) which Heidegger never ceases to place between the antagonists. How can one avoid disqualifying these fragile similarities when one bears in mind the indeterminateness which afflicts the *ego cogito* (§6/24, 21 and 31; 25, 11; §10/49, 28, etc.)?

(4) But precisely this indeterminateness itself remains undetermined and in such a way that it can be employed to bring the *ego cogito* and *Dasein* together as much as it separates them. Notice that for a long time *Dasein* itself, under the auspices of the 'I', itself remains 'undetermined' (§25/116, 6); up to the analysis of anxiety, its being (and not simply that of the *ego*) remains 'ontologically undetermined' (§39/183, 21–2). In other words, getting rid of indeterminateness presents a difficulty even for *Dasein*, to the point that the final §83 leaves one with the impression that it still has not been resolved. There is more. The charge of

indeterminateness, brought first against the *cogito* and then again against *Dasein* reaches a positive and legitimate phenomenological determination in the most decisive moments of *Sein und Zeit*. Three instances at least attest to this. First, that anxiety where *Dasein* opens itself to anxiety in a totally undetermined way (*völlig unbestimmt* §40/186, 18–19, in the same terms as 24, 31); *Dasein* does not open itself to anxiety in the face of a determinate being because it is precisely affected by the impossibility of finding such an entity, an entity from which it can flee or which it can repel; thus ‘the specific indeterminateness of that in the face of which *Dasein* finds itself in anxiety makes itself apparent: the nothing and the nowhere (*das Nichts und Nirgends*)’ (§40/188, 28–30). In short, it is through indeterminateness that *Dasein* arrives at that determinateness which belongs to it in accordance with care (*Sorge*), at anxiety. It is this indeterminateness which makes it possible for *Dasein* to transcend being with a view to a nothingness which will come back again later to being. Indeterminateness is in this instance ontologically determinative. Second, because being-toward-death represents a possible way of being for *Dasein* it brings with it the indeterminateness of the moment of death. ‘With the certainty of death there goes the indeterminateness (*Unbestimmtheit*) of its ‘when’ (§52/258, 23–4; see also §53/265, 22, etc.). The indeterminateness of the moment of death holds *Dasein* open in the possible which, in its turn, brings to light a temporalization through the future; so in this instance, indeterminateness determines temporally. Third and last, that resoluteness through which *Dasein* decides (possibility) about itself in its very being (anxiety) bears the character of ‘positive’ indeterminateness (§57/275, 3):

To resoluteness, the *indefiniteness* characteristic of every potentiality-for-Being into which *Dasein* has been factually thrown, is something that necessarily *belongs*. Only in a resolution is resoluteness sure of itself. The *existentiell indefiniteness* of resoluteness never makes itself definite except in a resolution; yet it has, all the same, its *existential definiteness*.

(§60/298, 30–5)¹⁸

The ontic indeterminateness (indefiniteness) of *Dasein* guarantees its existential (therefore ontological) indeterminateness. In fact, this indeterminateness indicates that *Dasein* is not interested in any determinate entity but engages itself in the horizontal projection of all beings in general, therefore, in the end, transcends beings in general toward their very being. From our point of view, it is worth emphasizing here that indeterminateness can assume an eminently positive meaning, on condition that it frees *Dasein* from any determinate being and frees it for being in general. Where are we to draw the line between the indetermin-

ateness of the *ego cogito* and the indeterminateness of *Dasein*? It certainly cannot be drawn on the basis of a distinction between determinateness and indeterminateness but between two modes of indeterminateness – ontic, on the one hand, ontological, on the other. The *ego cogito*, ontically determined as a particular real being among others, remains ontologically indeterminate. Ontologically determined (as the sole being whose being is in question), *Dasein* remains, as such, ontically indeterminate in the face of determinate beings. The *ego cogito* and *Dasein* share a certain indeterminateness but they manifest it differently – in accordance with an ontological difference. Subject to this indispensable qualification, one may conclude that *Dasein* confirms the indeterminateness of the *ego* – to the point of almost being the very opposite of the latter.

7 The recuperation of a Cartesian horizon in *Sein und Zeit*

What conclusions can be drawn from these conditional confirmations? Unquestionably, the 'destruction' of the *res cogitans* would not have been so urgent at the time of writing the Introduction to *Sein und Zeit* if *Dasein* had not been able to recognize itself in it so clearly. The *ego* appears to *Dasein* as a deficiency but more particularly as a danger whose fascination is still sufficient to impose norms and which, for this very reason, has to be resisted, at least more arduously than Husserl did. In its ceaseless struggle to mark off *Dasein* from the *cogito*, *Sein und Zeit* therefore had to go over its inadequacies step by step, undo its decision and reverse its orientations. However belligerent it might be, such a confrontation cannot avoid a certain mimetic rivalry where the conqueror sometimes appears to have been conquered by his victim, in some way or other. In short, precisely because *Sein und Zeit* never ceases to call it in question, the *ego cogito* appears more enigmatic in itself and closer to *Dasein*. Because the analytic of the one only proceeds by way of a destruction of the other, it confirms the continued validity of the former.

If the '*cogito sum*' is to serve as the point of departure for the existential analytic of *Dasein*, then it needs to be turned around, and furthermore its content needs new ontological–phenomenal confirmation. The '*sum*' is then asserted first, and indeed in the sense that 'I am in a world'. As such an entity, 'I am' in the possibility of Being towards various ways of comporting myself – namely, *cogitationes* – as ways of Being alongside entities within-the-world. Descartes, on the contrary, says that *cogitationes* are present-at-hand, and that in these an *ego* is present-at-hand too as a worldless *res cogitans*.

It is simply stupefying that, at the end of the preparatory analytic of *Dasein* and after carrying through his 'destruction' of Descartes, Heidegger should still be sketching out the possibility of a retranscription of the analytic of *Dasein* in terms – certainly displaced and reinterpreted – of the Cartesian *ego*. Undoubtedly, this historical figure must have exerted a powerful fascination if he still found it necessary to refer to him after his critique of historical avatars and of the phenomenological tradition. *Dasein* is itself disentangled from the figure of Husserl's constituting consciousness by a repetition of the *ego sum* against Descartes' *ego cogito*. Far from disappearing in one or another *Kehre*, this attempt at a repetition covers Heidegger's entire thinking as is confirmed by a seminar held in 1968.

The paragraphs devoted to Descartes in *Sein und Zeit* constitute the first attempt to escape from the prison of consciousness, or rather not to get into it. It is certainly not a question of restoring realism against idealism; for, by limiting itself to establishing the reality of a world for the subject, realism remains dependent upon Cartesianism. It is much more a question of thinking the Greek meaning of the ἐγώ.

(Questions IV, p. 222)

Heidegger had certainly undertaken something in the order of a topical overcoming of the *ego* in the direction of the ἐγώ when he commented on the *Protagoras* (*Nietzsche II*, p. 135, etc.); but he surely carried this through more radically with his analytic of *Dasein* – a non-Cartesian *ego* with which perhaps he went even further than the Greeks ('über das Griechische hinaus', *Zur Sache des Denkens*, p. 79). In short, *Dasein* represents a fulfilment just as much as a destruction of the *ego* since such a destruction comes down to determining the *sum* – which Descartes left undetermined. That this ontological determination is carried through by way of a multiform ontic indeterminateness reinforces the appearance of a new 'affinity' – between Descartes and Heidegger and against Husserl.

This Cartesian haunting of *Sein und Zeit* can be illustrated by two other arguments. More exactly, it provides two other questions with an argument.

(1) The penultimate paragraph of *Sein und Zeit* introduces a strange formulation of what is normally called the *cogito*. 'This absolute negativity [sc. Hegel] offers a logically formalizable interpretation of Descartes' *cogito me cogitare rem* in which he sees the essence of consciousness' (§82/433, 12–16). The lecture course of Summer 1927, *Grundprobleme der Phänomenologie*, will persist with this claim: 'The *cogitare* is always, according to Descartes, a *cogito me cogitare*' (GA 24,

p. 177). Heidegger knew perfectly well that Descartes had never presented the *cogito* in this way.¹⁹ Why then did he advance and uphold this new claim? Because, if he did not reproduce the letter of the Cartesian texts, he did at least produce the metaphysical essence of what, with the primacy of the *ego cogito* over the *cogitata*, came to be in the history of being – namely, the essence of representation. In fact at this point, and just before it got lost in inconclusiveness, *Sein und Zeit* still makes possible that long and continuous mediation of representation which finds expression first in the principle of reason and then in technology.²⁰ The continuity between the interrupted effort of 1927 and the essays on the history of metaphysics which culminate in *Nietzsche* and *Holzwege* is sustained, despite the *Kehre*. But it is sustained through the intermediary of Descartes. Not only does the Cartesian theme traverse the whole of *Sein und Zeit* (to whose homogeneity it contributes considerably), it also prepares the analytic of *Dasein* and the ‘destruction of the history of ontology’ for the lengthy meditation to come on the theme of *Seinsgeschichte*. The *ego* of *cogito me cogitare (rem)*, as the intimate adversary of *Dasein*, projects *Sein und Zeit* towards what nevertheless recedes from it.

(2) But, precisely, the ghostly presence of the Cartesian theme also prevents *Sein und Zeit* from advancing further along the way which leads beyond metaphysics. Even if one admits that it can be invoked in the singular, the *Kehre* makes itself known through two carefully researched, if not unequivocally established, disappearances: that of the language of metaphysics, that of the ‘subject’, including thereunder, in the end, *Dasein* itself. To be sure, *Dasein* will only be eliminated slowly, but it seems indisputable that the ontological difference will only find its classic formulation by eliminating the mediation between being and beings. Certainly, the language of metaphysics will persist, both as a point of departure and as a residue; but it seems to be more or less established that the phenomenological vocabulary of *Sein und Zeit*, whether transcendental or ontological, is, in every possible instance, demolished after 1935. *Sein und Zeit*, on the contrary, makes use of the vocabulary of metaphysics (which it pretends to question) through and through and so remains affiliated with subjectivity (even if only to destroy it). Amongst the motives for these impediments the least significant is certainly not the powerful shadow of the *ego cogito*, which ceaselessly obscures the phenomenological discoveries which *Dasein* is only capable of achieving against it. The adversary (singled out and only too well known) – the *ego* – conquers by the very mimicry which it imposes upon its conqueror, *Dasein*. In fact, Heidegger was only able to get away from his point of departure in *Sein und Zeit* by breaking with *Sein und Zeit* itself. But just as this break was never complete, it was not consummated with

Heidegger's dismissal of Descartes, who continues to speak loud and clear in the last *Seminars*.

In the context of ambiguities such as these two conclusions are clearly called for. First, even the most historical or systematic of Descartes' interpretations cannot dispense with a discussion of the Cartesian hermeneutic offered by *Sein und Zeit*. Second, the understanding of *Sein und Zeit* in the light both of its phenomenological point of departure and its 'destruction of the history of ontology', as also in its analytic of *Dasein* and right through to its inconclusive conclusion, must remain closed just as long as the Cartesian theme of the *ego* is not, in all its multiple dimensions, placed at the centre of the interpretation. In *Sein und Zeit*, Heidegger and Descartes are both interpreters each of the other.

Translated by Christopher Macann

Notes

1 GA 61 (Frankfurt, 1985), Anhang I, p. 173. In the earlier texts, references to Descartes are, to our knowledge, very incidental (for example GA 1, p. 43).

2 *Questions IV* (Paris, 1976): the original is given here in French. See *ibid.*, pp. 122, 220, 245, 289 and 320. On the relation of Descartes to Fichte and Hegel one should consult the recent research of A. Philonenko 'Sur Descartes et Fichte' and B. Bourgeois 'Hegel et Descartes' (in both cases more reserved than Heidegger) in *Les Etudes philosophiques*, 2 (1985), pp. 205ff. and 221ff.

3 When does Husserl begin to discuss Descartes? We find a reference to the latter as early as *Logical Investigations I*, LU, t. 2, 64, and he is discussed at length in an Appendix, added as a complement to the 6th Logical Investigation, LU, t. 3, 223, 235, 240, 241. But he is only considered here as an opponent. On this see F.-W. von Herrmann, *Husserl und die Meditationen des Descartes* (Frankfurt, 1971).

4 On the importance of the difference between finite and infinite substance which Heidegger, like Husserl, overlooks, see von Herrmann, *Husserl*, pp. 17–20 and, from the point of view of this study, my work *Sur le prisme métaphysique de Descartes* (Paris, 1986), chap. III, §13, pp. 161ff.

5 Regarding the bearing of this accusation, see our essay 'Being and the phenomenon,' in *Phénoménologie et métaphysique* (Paris, 1984).

6 'Here we can already recognize an affinity [*Verwandschaft*] with Descartes. What is worked out, certainly at a more elevated level by phenomenological analysis, as pure consciousness is the field that Descartes confusedly anticipated under the title of *res cogitans*, the global field of the *cogitationes*, while the transcendent world, the paradigmatic index of which is furnished for Husserl by the fundamental layer of the world of material things, is characterized as *res extensa* by Descartes. This affinity is not limited to a contingent fact. Husserl explicitly assumes a relation to Descartes when he declares that this mediation has reached its peak.' ('Prolegomena zur Geschichte des Zeitbegriffs', SS. 1925, GA 20, p. 139). A note by Heidegger in his personal copy of *Sein und Zeit* confirms the permanence of his conclusion about this 'affinity'. While criticizing the Cartesian reduction of the phenomenon of the world to material nature, he

adds 'Critique of Husserl's construction of "ontologies"!' *Sein und Zeit* §21/98, n. a).

7 This analysis should be completed and confirmed by the parallel represented by 'Prolegomena zur Geschichte des Zeitbegriffs', §22. 'Das traditionelle überspringen der Frage nach der Weltlichkeit der Welt am Beispiel Descartes' (GA 20, pp. 231ff.).

8 See *Sein und Zeit*, §123/58, pp. 33–8 and the note from the personal copy 'Rückdeutung, regressive interpretation'. Conversely, the *Abkehr/hinkehren* game in the context of anxiety §40/186, pp. 3–8.

9 On its posterity in the later work see H. L. Dreyfus, 'De la techne à la technique: le statut ambigu de l'ustensilité dans *L'Etre et le Temps*', in Heidegger (Paris: L'Herne, 1983), pp. 202ff.

10 See *Sein und Zeit*, §21/100, pp. 7–14. The apriori character of the Cartesian doctrine of substance cannot be overestimated, see *Sur le prisme métaphysique de Descartes*, chap. III, §§13–14.

11 On this point, see our sketch: 'L'unique ego et l'alteration de l'autre', in 'Intersoggettività, socialità, religione', *Archivio di Filosofia* liv, 1–3 (1986).

12 Similarly in 'Prolegomena zur Geschichte des Zeitbegriffs', §22/GA 20, p. 239.

13 The familiar formula 'being can never be explained by way of beings' (208, 3–4 = 207, 30 and 34, §2/6, 18, §41/196, 17f.), received decisive confirmation in a note to Heidegger's personal copy: 'Ontologische Differenz' (ibid., 208). Thus we find explicit confirmation that the indeterminateness of the meaning of being leads to (or results from) a misunderstanding of the ontological difference by Descartes.

14 This formula – decisive – only appears in the *Meditationes*; however, Heidegger does not seem to make of it a special case.

15 Similarly in *Sein und Zeit* §6/24, 30f.: §20/92, 6f.: §21/95, 5–25; §44/229, 36–40.

16 That Cartesian 'egoity' anticipates Heideggerian 'mineness' is confirmed by the similarity of the objection brought against them by Pascal (*Pensées* 397 and 597) and E. Lévinas (*Totalité et infini*, p. 61, etc.) respectively – the objection of 'injustice'. For other more positive conceptions of the 'Ich bin' see *Sein und Zeit*, §58/281, 25–7; §60/297, 15–17; §63/313, 28–30; §64/317, 27–8f.

17 For a confirmation of this interpretation of Cartesian liberty as the possibility of the impossible, one might refer to my: *Sur le prisme métaphysique de Descartes*, chap. III, §15, pp. 203–16.

18 Similarly *Sein und Zeit*, §62/308, pp. 16–40.

19 Heidegger adds: 'obzwar nicht eigens und ausdrücklich gemeint' (GA 24, p. 177). In fact several of Descartes' statements could be employed more or less to validate his claim though he does not cite them. For instance, AT VII, 33, 12–14; 44, 24; 352, 1–18; 559, 6–7: AT V, 149 (see *Sur la théologie blanche de Descartes* (Paris, 1981), 391f.).

20 The principal mediations on the *cogito me cogitare* (with, it is true, the frequent omission of the final *rem*) are to be found successively in 1938, 'Die Zeit des Weltbildes', in *Holzwege*, GA 5, pp. 108–9 (n. 9), 'Der europäische Nihilismus', in *Nietzsche II*, p. 48 etc., and in 1936–46, 'Berwindung der Metaphysik', in *Vorträge und Aufsätze*, I, p. 65, etc. One should also add all the developments devoted either to the *subjectum* or to the *re-presentatio*. Some further references and indications are to be found in my sketch: 'Heidegger et la situation métaphysique de Descartes', *Bulletin Cartésien IV*, in *Archives de Philosophie*, 38(2) (1975).

The 1929 debate between Cassirer and Heidegger

Pierre Aubenque

Between 1923 and 1931 Cassirer and Heidegger engaged in relations which, without being close, were marked by mutual esteem and, at least at the beginning, by a quite considerable community of interests, aiming at nothing less than the renovation of the philosophical enterprise and at the extension of its field of employment. In a note to *Sein und Zeit* (p. 51, n. 1), Heidegger invokes the second part of the *Philosophy of Symbolic Forms*¹ and praises Cassirer for having made 'mythic existence' the theme of a philosophical interpretation which surpasses the bounds of 'ethnological research' and furnishes the latter with the 'leading themes' which it lacked. Heidegger simply doubted whether Cassirer would be able to find an adequate basis for a hermeneutics of existence (envisaged in all its manifestations) in the architectonic of Kant's *Critique* and, referring to a note from the *Philosophy of Symbolic Forms* (p. 16) which invoked the horizons opened up by phenomenology, he emphasized that, resulting from a meeting at Hamburg in December 1923, Cassirer and he were in complete agreement on the 'necessity of constituting an existential analytic'. What followed would show that Cassirer and Heidegger did not in fact mean the same thing by this requirement. In his review of Cassirer's work on myth, which appeared in 1928 in *Deutsche Literaturzeitung*, Heidegger deplores the fact that the very 'phenomenology of mythic consciousness' which Heidegger himself had considered essential should be limited to an 'extension of the transcendental problematic in the neo-Kantian sense: to grasp not merely the unity of nature but also the unity of culture as referring back to certain laws of spirit'.² In proceeding in this way, Cassirer neglects the essential question, which is that of the mode of being of 'spirit', of its rootedness in a human existence to the very structure of which there belongs something like 'myth in general'.³ To sum up, what was lacking in Cassirer's analyses was a 'foundation in a radical ontology of existence'.⁴

In his own long review of Heidegger's work *Kant and the Problem of Metaphysics*, published in 1931 in *Kant-Studien*, Cassirer proves to be just as critical. While acknowledging the 'interior passion' and the 'genuinely philosophical temperament' which made it possible for Heidegger to 'carry us right to the vital centre of the problems',⁵ while affirming his agreement with the importance Heidegger accords to the doctrine of the 'productive imagination' (p. 63), he reproaches him with 'seeking to refer, indeed to reduce' all the faculties of knowledge to the imagination (p. 72). In so doing, he fails to appreciate the transcendence of spirit and 'dissolves the idea of the "Logic" in the cross-currents of a process of originary questioning' and, in accordance therewith, reduces liberty to a foundationless foundation, to wit, the 'abyss [*Ab-grund*] of Dasein' (p. 82). At this point Cassirer even raises the tone somewhat. Heidegger's formulas 'are to be understood out of Kierkegaard', but they are alien to the spirit of Kant, the philosopher whom Heidegger is claiming to critique. For

Kant is above all a thinker of the *Aufklärung* in the most beautiful and elevated sense of that word. He strives toward the light and toward clarity at the very point at which he reflects upon the most profound and most hidden 'foundations' of being. . . . The philosophy of Heidegger, it has to be said, bears the marks of another style.⁶

The debate between Cassirer and Heidegger on the interpretation of Kantianism and, by way of it, on the very meaning of philosophy, found its culmination at Davos in March–April 1929, on the occasion of the university lectures organized for the second consecutive year in the township of Grison. One of the objectives of these meetings was to bring together, on the neutral soil of Switzerland, French and German intellectuals, to organize, as one of the participants, Jean Cavaillès, was to proudly declare, an 'intellectual Locarno'. In fact, and to stick simply with the philosophers, two Frenchmen, A. Spaier and Léon Brunschvicg, contributed to these meetings. But the list (by no means exhaustive) of young French philosophers, still unknown students at the time, who took part in these lectures, is impressive: Jean Cavaillès, M. de Gandillac, E. Lévinas, P.-M. Schuhl. On the German side, the two 'stars' who, to all appearances, outshone their French equivalents, were Cassirer and Heidegger. Among the German students present, O. F. Bollnow and J. Ritter should be mentioned since we are indebted to them for a valuable summary (*Protokoll*) of the discussion between Cassirer and Heidegger. The general theme of the lectures was: 'Man and generation'. It was apparently addressed as such by the historians of the literature who had been invited to Davos. 'In return', as Jean Cavaillès noted ironically, 'the professional metaphysicians paid little attention to the question,

assuming, no doubt, that all came down to a matter of philosophy.⁷ For all that, it is possible to connect the general theme of the lectures 'What is Man?' with the lectures by Cassirer on philosophical anthropology and with those of Heidegger on *Kant's Critique of Pure Reason and the Task of Laying the Foundations of Metaphysics*. These lectures by Heidegger offered in fact a sketch of the interpretation of Kantianism which he was going to make known a few months later with the publication of his work on *Kant and the Problem of Metaphysics*. The discussion which took place between Cassirer and Heidegger in the 'Arbeitsgemeinschaft' (and whose proceedings were summarized by Bollnow and Ritter), dealt with Heidegger's interpretation of Kant and furnish, live, Cassirer's first reactions, together with the objections which will be developed a little later in connection with the already cited review of Heidegger's work.

Most of the documents relevant to this discussion have already been edited (some for the first time) and translated into French in a work published by me in 1972 in collaboration with Pierre Quillet.⁸ The only important text which eluded us is the very lively and objective *compte rendu* by Jean Cavaillès, a copy of which I obtained thanks to Maurice de Gandillac, and a few passages from which I have transcribed in the appendix to this piece [not included – ed.]. In what follows, I would like to try to bring out the meaning and the presuppositions of the discussion at Davos by relying primarily upon the official summary. But the latter will be clarified and made more specific with the help of the summary of the conferences and the review by Cassirer of Heidegger's work.⁹

What furnishes the apparent basis of the debate and its explicit point of departure is the opposition between the neo-Kantian interpretation of Kantianism as a general theory of knowledge and, in particular, as an attempt to lay the foundations of scientific knowledge, and Heidegger's own interpretation that sees in Kantianism an enterprise which seeks to found metaphysics on an analytic of the finite existence of man.

This point of departure is soon superseded to the extent that Cassirer, despite his particular admiration for Hermann Cohen, cannot be considered, and does not consider himself to be, an orthodox neo-Kantian. For Cassirer, even if the mathematical science of nature can be regarded as a 'paradigm', it does not in itself 'constitute the whole problem' (*P*, p. 30). Science does not exhaust the productivity of spirit which is manifest with equal right in the constitution of symbolic forms in general, whether they take the form of language, of myth, or of culture. Spirit cannot be reduced to reason or understanding. Cassirer himself brought out the importance of the transcendental imagination with Kant, for whom it functions not merely as an intermediary but as an original and autonomous power, in effect, a *synthesis speciosa*, that is, a faculty

productive of images and symbols whose legitimacy is on a par with that of the pure concepts of the understanding.

The agreement on this last point between the two philosophers is frequently underlined by Cassirer (pp. 30, 32). But what, for Cassirer, is only an extension of neo-Kantianism becomes, with Heidegger, a radical inversion (p. 43). Even if Heidegger and Cassirer both admit the central character of the imagination, a more detailed analysis makes it possible to appreciate that, for Cassirer, the spontaneity of the productive imagination announces and prefigures that of the understanding while, for Heidegger on the contrary, the element of the *speciosum*, to be found in the synthesis of the imagination, is the element which leads all synthesis, including that of the understanding, back to the facticity of an originary 'reception'.

The fact that the mathematical science of nature should be regarded by Cassirer as a paradigm is enough to have Heidegger place his interlocutor in the neo-Kantian camp, that is, in a foundational enterprise which culminates in the constitution of scientific objectivity. But a foundation presupposes a 'ground' as Heidegger says (*P*, p. 43), a *terminus a quo*, as Cassirer prefers to put it. They both agree in seeing finitude as the point of departure for the Kantian enterprise. Heidegger has no difficulty in getting Cassirer to accept what he establishes at length in his Kant book: the finitude of man manifests itself in the 'derivative' character of the kind of knowledge of which he is capable; deprived of intellectual intuition, that is, of an intuition which would be capable of creating its object, like God's *intuitus originarius*, he is only equipped with a 'derivative' intuition, that is, an intuition subject to the condition of the 'reception' of an object. Without the receptivity of intuition, understanding would lack an object and its spontaneity would be useless. But, with the exception of this point in common (by no means a trivial one: before them one hardly ever insisted upon 'receptivity' in the Kantian tradition, except to see therein a cunning of spontaneity), the interpretations diverge in an irreversible fashion. Heidegger's central idea, which Cassirer brings out very clearly in his review of the book, is that one does not escape from one's point of departure, and that every attempt to escape from it simply continues to bear the traces of it. According to Heidegger, Kant's insistence upon spontaneity

should not be understood or pointed in a direction which contradicts the point of departure of the Kantian problem. It should always be borne in mind that it is an expression of the finitude of human knowledge and not a denial or abolition of this finitude. . . . The original link with intuition can never be broken, the dependence upon it which it brings with it can never be set aside. It is not possible to break the chain of finitude. All thinking as such, indeed any 'purely logical'

employment of the understanding, already bears the imprint of finitude.

(R, p. 61)

The 'finitude' of thought rests on the fact that it is 'empty' if it is not filled with intuition, that in this sense it is therefore derivative and dependent and from the very moment in which it imposes its law upon what is sensibly given. In short, finitude is not only for Heidegger the *terminus a quo* of human knowledge and existence (here Cassirer agrees); unsurpassable and insurmountable, it stamps its mark upon the *terminus ad quem* (which is, for Heidegger, the question of being), a conclusion which Cassirer vigorously contests (pp. 40, 42–3).

Cassirer's arguments against the affirmation of the unsurpassable character of finitude are of two kinds. The first calls in question the legitimacy of the distinction between finite and infinite knowledge. It takes its stand on the model of that divine understanding with reference to which human knowledge is characterized negatively as finite. Citing Kant, Cassirer reminds Heidegger that such an understanding is itself 'a problem . . . that is, an object the very possibility of which cannot be represented in any way'.¹⁰ The only use, added Kant, that can be made of the idea of a divinely creative intellect is 'purely negative', or in other words, that of an infinite understanding. Heidegger, against whom this appeal to Kantian orthodoxy is advanced as an objection, has no trouble in agreeing with it. For the Cartesian argument to the effect that one has to have the idea of infinity in order to think the finite (and which would require that one sees in the idea of an infinite understanding something much more than a 'problem') is only valid 'from a formal point of view' (P, p. 35). 'Materially speaking', that is, in the order of real dependence, it is finitude which is constitutive, infinity being derived by means of the purely negative idea which we have of the latter. Heidegger's strategy consists in tracing back to finitude, as to its very basis, everything that at first sight seems to stand opposed to it in Kant. To Cassirer, who underlines the productive and therefore already 'spontaneous' character of the imagination and illustrates this point by invoking the 'originary' character (in Kant's sense 'creative') of the *exhibitio originaria* by means of which Kant typifies the imagination of the schematism, Heidegger retorts: 'Originary certainly, but this originaryity is an exhibition of the representative capacity, of the free "self-giving" which harbours the necessary relation to a "receptivity"' (P, p. 35). The necessity which obliges originaryity to proceed by way of exhibition seems to Heidegger to be a supplementary proof of finitude. In a more general way, the fact that the 'ontological comprehension of being' (ibid.) has to pass by way of a purely 'ontic' experience of beings is precisely that of finitude. This is how the, at first sight, seemingly odd affirmations

of Heidegger (affirmations which are not expressed with the same degree of radicality in his published work) are to be explained: 'Ontology is an index of finitude. God does not possess it. And that man has this *exhibitio* is the most convincing proof of his finitude. For only a finite being stands in need of ontology' (*P*, p. 35). One might add that only a finite being stands in need of 'this infinity' which breaks out in the imagination (*ibid.*)

Cassirer's second argument concerns the Kantian status of an understanding whose spontaneity is not eliminated but only solicited by the receptivity of that intuition which furnishes the occasion for it but also, and more especially, requires it. Cassirer thinks he stands in the direct line of Kantianism when he claims that: 'In the field of experience and of its phenomena, understanding possesses an integrally creative character. . . . In this way, the limitation of understanding bears witness to its irreducible spontaneity, *par excellence*, its authentic and not simply derivative creativity' (*R*, p. 64). Certainly, Heidegger does well to recall that human knowledge is, in its entirety, dependent upon intuition and even that all thinking, even including that of divine thinking, is 'at the service of intuition' (*R*, p. 65). But, as Cassirer remarks, service is not servitude:

The function fulfilled by the understanding in the service of intuition does not take away from it anything of its liberty nor of its autonomy. It serves intuition but is not subordinated to intuition; it remains its objective without being subjected to it or commanded by it. To such an extent indeed that the being of intuition, as determined intuition – and what would a being be deprived of all determination? – depends upon the function of the understanding.

(*ibid.*)

But this function of the understanding comprises, according to Cassirer, a positive element of infinitude: it concerns the requirement, imposed upon it by reason, to investigate 'the absolute totality of the synthesis of conditions' (p. 67). But Heidegger, once again, turns the argument around: the fact that the totality has to pass by way of a synthesis, that it stands in need of a 'construction', that the idea which sums it up should be purely regulative and not constitutive, that a progress to infinity is needed to approximate asymptotically toward its realization, this is precisely what is meant by finitude. One is reminded here of Hegel's 'bad infinity', with this difference, that this bad infinity is not due to a provisional self-limitation of understanding but is bound irrevocably to the ecstatic structure of *Dasein*.

At one point in the discussion at Davos, Cassirer introduces the military metaphor of a breakthrough (*Durchbruch*) and asks:

Does Heidegger want to give up this objectivity, this form of absoluteness which Kant reclaims in the ethical domain, in the theoretical domain, and in the *Critique of Judgment*? Does he want to withdraw completely back upon the closure of finite being and, if not, where is the breakthrough towards this sphere of objectivity?

(P, p. 33)

Heidegger does not reply directly to this question but one can see what his reply would have been: the 'breakthrough' refers back to an originary break (*Bruch*); the fact that man stands in need of a breakthrough in order to gain access to objectivity and to intelligibility is the sign of a non-possession, of a non-coincidence with self, therefore of finitude. By way of the metaphor of a 'breakthrough', it is the entire debate on transcendence which is in question. For Cassirer, transcendence is surpassing; it is the sign of man's participation in intelligibility; it expresses the pre-eminent dignity of reason, even human reason. In the temporal order, it is that which renders possible a progress towards the light. With Heidegger, transcendence is a movement immanent to Dasein, an expression of the ecstatic structure of temporality; it opens no other avenue for man than the awareness of his dereliction and his anguish in the face of the nothingness of a 'ground' which is in truth an abyss (*Abgrund*; P, p. 43).

An essential dimension would have been absent from the debate at Davos if the ethical question had not been broached. It is Cassirer who takes the initiative and this part of the discussion is all the more interesting for the fact that Heidegger has nothing to say on this point in *Kant and the Problem of Metaphysics*, as well, or so it seems, as in the talks given at Davos. Cassirer's argument is clear: if it is true that human knowledge is limited and that any intuition of the intelligible is denied him, that the 'breakthrough' does not go so far as the appropriation of new territories, then the practical activity of reason no longer knows these limitations.

It is here that we find the abrupt passage to another order. The barriers which limit us to a determinate sphere suddenly fall to the ground. Morality, as such, leads beyond the world. At this point a sort of breakthrough is accomplished which certainly constitutes the decisive metaphysical moment. It's a question of the transition to the *mundus intelligibilis*. This holds for the ethical, for it is in the ethical sphere that a point is reached which is no longer relative to the finitude of the knowing being, but where an absolute is posited.

(P, p. 31)

Cassirer might have relied here upon the universality and unconditionality of the moral law. He makes the mistake of introducing the notion of an 'imperative' (*P*, p. 30). Heidegger immediately takes advantage of this weakness. To Cassirer's suggestion that 'in the categorical imperative there is something which surpasses finite being' he objects that 'it is precisely the concept of the imperative which attests to the intrinsic relation to a finite being' (*P*, p. 84). In fact, though Heidegger does not insist upon it, he might have cited in support of his claim the Kantian doctrine of the imperative which limits its application, even in the case of the categorical imperative, to 'rational and *finite*'¹¹ beings. The categorical imperative is, in particular, the specific form which the moral law takes in the case of a rational being, certainly, but also a finite being, that is, a being blind to the transcendent Idea of the Good and whose will, contaminated by the proximity to sensibility, is not even holy (even if it can be *pure*), that is, does not coincide immediately with the moral law. The imperative form which the moral law has to assume in the case of man gives expression to the fact that the relation of a rational and *finite* being to the moral law is a relation of 'dependence', that is, of 'obligation' (*Verbindlichkeit*), and of 'constraint' (*Nötigung*). On this basis it becomes comprehensible that, as Kant puts it explicitly,¹² 'the imperative is not valid for a *divine* will and, in general, for a *holy* will'.

Cassirer would no doubt reply here that the imperative form which the moral law assumes in the case of man does not change its content, that is, its rationality. He comes back to this problem in the review of Heidegger's book, with reference to 'respect', to which Heidegger had devoted a brief analysis¹³ with a view to showing that, even in the practical order, feeling intervenes, that is, self-affection, submission to 'pure receptivity'. Cassirer reproaches Heidegger here for not

distinguishing between the sphere of specifically *ethical* problems and that of *psychological* problems. The content of the moral law is not, according to Kant, founded on the feeling of respect; the latter in no way constitutes its meaning. This feeling simply indicates the way in which the law, which is absolute in itself, is represented in finite empirical consciousness. It does not belong to the foundation of the Kantian ethic but to its application.

(*R*, pp. 70–1)

Cohen precisely distinguished between the question: 'What is the moral law?' and the question: 'Under what concept (or rather by way of what experience) does it appear within the human horizon?' Heidegger clearly is only interested in the second question. Cassirer, without ignoring the relative pertinence of the latter, thinks that the reply to the first question alone is essential and brings out the authentic meaning of

Kantian rationalism. This debate is concentrated in the end on the notion of freedom. In the discussion at Davos, Heidegger (more attentive once again to the processes which are revealed in them than to their intelligibility) talked of Kantian freedom as 'liberation' and he stipulated:

This liberation does not consist in, so to speak, freeing oneself for the formative figures of consciousness and for the kingdom of form, but in becoming free for the finitude of Dasein, plunging into the dereliction of Dasein, plunging into the conflict which is inscribed in the essence of freedom.

(*P*, p. 44)

Cassirer replies in his review:

The noumenal meaning of the idea of freedom . . . remains . . . rigorously separated from the manner in which it appears and presents itself in the sphere of psychic phenomena. . . . Kant repeatedly comes back to what concerns the idea of freedom and in consequence the idea of practical reason *itself*: it is a pure 'intelligible', unconnected with purely temporal conditions. It is a pure glimpse across the a-temporal – at the horizon of the supra-temporal.

(*R*, p. 71)

One can imagine Heidegger interrupting yet again on another score: why does the intelligible have to be 'glimpsed'? And what is a 'horizon'?

But it would be pointless to pursue this issue once the antagonistic principle has been identified. This is something upon which the two interlocutors seem to have reached some measure of agreement at the end of the discussion at Davos. Not without a certain sadness on Cassirer's part: 'It would lead nowhere to keep on underlining this opposition. We have reached a point where little can be expected from purely logical arguments' (*P*, p. 47). The *medium* of language has not functioned as it ought to have done, that is, as mediation (*Vermittlung*). It persists nevertheless, or at least that is Cassirer's 'postulate' and his 'requirement', as the context of 'mutual comprehension', right down to the differences:

Each speaks his own language, and it is unthinkable that the language of one should be transposed right over into the language of the other. And yet we understand each other through the intermediary of language. There is something like *the* language. And something like a unity over and beyond the infinity of different ways of speaking. This

is the decisive issue for me. And this is why I start out from the objectivity of symbolic form.

(P, p. 47)

It is obvious on the other hand that Heidegger does not expect anything to come of 'simple mediation' (P, p. 50) and he even seems to experience a certain sense of triumph at not having found it. In place of the *logos* or even a *dia-logos* through the development of which one might have been able to reach an agreement, he opposed once again the 'finitude of man', a finitude which 'manifests itself in a particularly radical manner' in philosophy and therefore makes it impossible for the latter to free us from it. Finitude can be translated here by what J.-F. Lyotard will call later the 'differend' and what Heidegger calls the 'differentiation' (*Unterscheidung*) of points of view. Only the recognition of differences at their root, a recognition which excludes any pretence of dialectical reconciliation, makes it possible to preserve the radicality of the question, which otherwise runs the risk of being constantly softened and finally forgotten.

In the context of a debate on Kant, it is not without interest to consider how these two antagonistic philosophies are confirmed by different attitudes towards the history of philosophy. Both Cassirer and Heidegger rely upon Kant's text. But Heidegger prefers to invoke philosophical themes isolated from their context (like the schematism, the imperative, finitude), because they seem to him to be more successful in revealing the un-thought (that is, the not-yet-thought) of the Kantian question. Cassirer is quite right in objecting that he extravagantly neglects the very context which is alone capable of conferring upon these texts the intelligibility intended by their author. Running the opposite risk from that assumed by Heidegger, which is to occasionally overlook the letter of this or that marginal or erratic assertion, Cassirer invokes the coherence of the Kantian system as a whole, its rationalizing and emancipating finality, its inscription in the general movement of the *Aufklärung*. With a view to supporting his interpretations, Cassirer invokes the understanding of Kant displayed by such contemporaries of his as Schiller or Guillaume de Humboldt. The historical argument is admittedly a double-edged sword. For against Schiller, who sees in Kantianism an evocation of an 'earthly anguish' through the aspiration towards the 'reign of the ideal',¹⁴ it is always possible to counter with Heinrich von Kleist who wants to preserve nothing more of the Kantian morality than the hardness of the imperative and the fearful transcendence of the Law.

In privileging the point of departure, the *terminus a quo*, of the Kantian process of questioning, Heidegger knows that he is neglecting its explicit development. But he thinks that this development is the result of a sort of inertia which leads the question inevitably towards a

'solution', which leads contradiction towards its 'overcoming', which leads thinking towards the 'system', and, in this way, forces it out of its original questionability. The radicalism of the point of departure is still operative, but there comes a time when it is obscured and denied: 'Kant found himself brought through his own radicalism to a position before which he could only withdraw' (A, p. 24). This is the justification Heidegger offers for the 'violence' of his interpretation in his book on Kant,¹⁵ a violence designed to climb back up the slope of the degradation which rationalization and subjectification represent for Heidegger, a descent which he will call later 'onto-theology'. Cassirer insists vigorously upon this violence, however theoretical it might appear:

I strenuously object to the legitimacy, the *quid juris* of the violence exerted by Heidegger against Kant. Heidegger no longer speaks here as a commentator but as a usurper who undertakes, one might almost say, to cut right through the Kantian system with a view to subjecting it to, and using it for, the ends of his own problematic. Faced with such a usurpation, restitution has to be demanded: the *restitutio in integrum* of the Kantian doctrine.

(R, p. 74)

In fact, a certain violence does make itself felt in Heidegger's discussion of 1929, extending beyond the technical problem of interpretation. Cassirer the humanist, the man of vision and culture, seems to be bothered by it even though, to judge by the testimony of the other participants, relations between the two men never ceased to be courteous. One can imagine the astonishment and the distress of Cassirer (and he was not alone), reading in the summary put about at Davos by Heidegger himself that 'Kant's position' (this position before which, to tell the truth, 'he could not fail to withdraw') means: 'destruction [*Zerstörung*] of what hitherto had furnished the foundations of Western metaphysics (Spirit, Logos, Reason)' (A, p. 24). And what did Heidegger have in mind when he claimed that 'the task of philosophy consists in prising man away from the laziness of a life limited to utilizing spiritual products, prising him away from this life to throw him back, in a certain sense, upon the harshness of his destiny' (P, p. 46)?

There was certainly an element of provocation in this speech. The Heidegger of 1929, still young and having already attained a measure of philosophical glory, was addressing (and before an audience of students, most of whom he had already won over) a representative of what was still in Germany, and by way of neo-Kantianism, the dominant philosophical tradition.¹⁶ And he seemed to be enjoying the role of iconoclast, *vis-à-vis* a personality whom a witness described as 'olympian'.¹⁷ To anyone who thinks that the debate between these two men could have been

altered, particularly on Heidegger's side, by extra-philosophical interventions, I would like to point out that the radicality of philosophical confrontation between the defenders and the opponents of classical rationalism was frequently translated in the period of the 1920s and 1930s into a certain violence of tone and, in particular, the brutality of metaphors which are wilfully 'heroic' (Cassirer cannot be entirely excused here with this metaphor of the 'breakthrough'). It is hardly necessary to note that Bergson, who in the *Two Sources of Morality and Religion* was going to denounce the 'dismantling power of the intellect', saw in the act of philosophizing an ultimately painful 'tension' and was about to confer the task of founding an 'open' morality not upon the universality of a law but upon the 'heroic' example of an individual whose very existence is an 'appeal'. Hence, the astonishing page which literally evokes the march of the Valkyrie and with which the third chapter of *Creative Evolution*¹⁸ comes to a close. In this regard, Heidegger could even appear the more sober contestant to a witness like Jean Cavaillès who, in the end, ranks him among those who seek to 'construct a system of concepts' rather than among those who attempt to 'translate profound and personal intuitions by means of a complicated verbal symbolism'.¹⁹

In as much as the debate at Davos announces other controversies it is, in my opinion, a matter of controversies which are equally philosophical and which have not ceased to be of concern to us. They can be grouped around a question of foundations which was already clearly articulated at Davos and bears upon the conditions of the exercise and legitimacy of reason. Against Cassirer and the entire rationalist tradition, Heidegger maintains that reason is neither an *index sui* nor a *causa sui* nor a *norma sui*. He takes the expression 'Critique of Reason' in an almost juridical sense. But can reason be both the judge and the plaintiff before the tribunal of reason? Only by pushing beyond reason does it become possible to situate reason or, what comes down to the same thing, to 'de-construct' it. Cassirer, on the contrary, knows no other anchorage than reason which, precisely because it is transcendent, overcomes – and passes judgment upon – its own initial finitude. Heidegger is only ready to acknowledge the rootedness of reason in finitude and he forbids it the exorbitant privilege of being the sole instance, capable therefore of conferring upon itself the task of being its own critic. In this way he is able to escape the challenge of a critique from outside. But then, if the judgment of reason ceases to be for Heidegger the centre of reference, he finds himself confronted with the obligation of letting it be known what criterion he proposes to substitute for that of rationality. The least one can say is that he never got to the bottom of this task.

It only remains to say that the discussion at Davos announces, or even inaugurates, a number of contemporary debates on the crisis of reason and culture, on the 'dialectic of enlightenment', on the uni-dimensional

effects of rationality, on the tyranny of the *logos*, on the end and the overcoming of metaphysics, on post-modernity. Thanks to Cassirer and Heidegger this debate was set out in such a way that it could be generalized and carried to the highest theoretical level in the years to come.

8 *E. Cassirer-M. Heidegger, Débat*. This work, which is out of print today, had a secret and tormented history which I am in a position to release to the public seventeen years after the event, that is, after the principal protagonists have died. In 1968, Heidegger told me that as far as he was concerned I had his permission to publish this work, with the sole condition that the published text of the 'protocol' should not be presented as if it had been revised by him, a condition which was respected. Shortly after the publication of the work, the publisher Beauchesne received an official letter from the German publisher, Vittorio Klostermann, who claimed the entire copyright for himself and, under the threat of a court action, called for the destruction of the printed copies. From a letter V. Klostermann addressed to me later it transpired that he was wrongly informed by a reader at his firm who misled him with regard to the meaning of my 'presentation', which was thought to be an anti-Heideggerian pamphlet! When I talked with him, Heidegger took refuge behind his editor, to whom he had in effect (something we did not know at the time) already confided the exclusive rights to his work (in fact, one year later, V. Klostermann went on to publish the German text of Bollnow-Ritter's Protocol in the 4th edition of *Kant und das Problem der Metaphysik*). To avoid a court case against Heidegger which we might very well have won (the question of author's rights being juridically controversial) but which I had no intention of engaging in, the director of the collection, P. Marcel Regnier and myself, in agreement with J.-M. Fataud and P. Quillet decided to withdraw the volume from sale. Recently, an agreement with Gallimard, who possess the exclusive rights to the French translations of

Heidegger, was sufficient to make possible a reprint of this work. I would like to take this opportunity of thanking the editors and the family of Ernst Cassirer who, though equally concerned, never offered the least objection to our publication.

15 Heidegger, *Kant und das Problem der Metaphysik*, p. 182; cited by Cassirer, *R*, p. 73.

16 In view of the fact that in my oral communication I used the word 'establishment' with reference to Cassirer, Mme E. Pinto rightly remarked that Cassirer was not at all representative of the university 'establishment'. In fact, if he was Rector of the University of Hamburg, it remained the case that the latter, a more recent creation, was certainly not among Germany's most prestigious. But neo-Kantianism was solidly implanted at Berlin, where Nicolai Hartmann taught, as it was at Marburg. Besides, Cassirer belonged through his family to the enlightened and liberal faction of the Berlin upper middle class and could pass as one of its thinkers.

17 L. Englert, in the brochure cited at note 7 above. Also cited by G. Schneeberger, *Nachlese zu Heidegger* (Berne, 1962), p. 4.

18 Numerous texts intended to illustrate the irrationalist current, particularly with reference to Germany, have been brought together by G. Lukács in *Die Zerstörung der Vernunft* (Berlin (Est), 1954), whose title literally reproduces – could it have been a coincidence? – the formula used by Heidegger in his summary of the papers given at Davos (*A*, p. 24). If, in Lukács' work, Cassirer is not mentioned by name, and if neo-Kantianism is more or less spared, still Heidegger receives no more severe criticism than that addressed to Husserl, to Jaspers . . . and even to Wittgenstein.

Hermeneutics in theory and in practice

Christopher Macann

Heidegger's *Kant and the Problem of Metaphysics* is a unique contribution to philosophical literature. At the time of writing, it was the only example of an attempt by a philosopher to interpret the thinking of a major historical figure in such a way that the basic structures of the interpreter's own philosophy emerged in the course of the interpretative transformation of the work under examination. No doubt this is why it attracted so much attention in its day¹ and why it has continued to prompt voluminous critical attention right up to the present time.

In this paper, I would like to do three things; first, to show the connection between the hermeneutical principles laid out in *Being and Time* and the putting into practice of these theoretical principles with regard to Heidegger's interpretation of the *Critique of Pure Reason*; second, to assess the validity of Heidegger's Kant interpretation; and third, to recommend to the attention of the reader an alternative procedure embodied in my own Kant interpretation.²

At the end of the Introduction to *Being and Time*, Heidegger outlines a programme which he never completed as anticipated. Part One is the systematic part of the programme. It falls into three parts: (1) the preparatory fundamental analysis of Dasein; (2) Dasein and temporality; (3) Time and being. The first two sections of Part One make up the two parts of *Being and Time*. The third section was never completed as originally envisaged. First delivered as a lecture much later in 1962, it opens up an entirely new way of thinking about Being – as Maria Vilella-Petit has stressed in her paper on Space (chap. 5, vol. I in the present work). Part Two falls under the head of a so-called 'phenomenological destruction of the history of ontology'. Again, it falls into three parts: (1) a study of Kant's doctrine of the schematism. (2) An investigation into the ontological foundations of Descartes' *cogito*. (3) A study of Aristotle's essay on time.

At the time of writing *Being and Time*, Heidegger already had a great deal of material accumulated towards an interpretation of Aristotle, material which served as the basis for his promotion to the rank of *professor extraordinarius*, and which was later published in such volumes of his *Gesamtausgabe* as the *Logik* (GA 21) or the *Aristoteles* volume (GA 33). *Being and Time* itself contains extensive analyses of the ontological foundations (or lack of them) of Descartes' dualistic philosophy and the discussion with Descartes continues right to the end – as Marion's paper shows. But it was the Kant material which underwent the most radical transformation, basically from a study of the schematism into three entirely distinct bodies of material each of which occupies an entire volume of the *Gesamtausgabe*.

Though Heidegger's debate with Kant permeates other texts which do not take Kant as their specific theme,³ it is the three volumes specifically devoted to Kant which merit special attention. First, there are the so-called Marburg lectures of 1927/8, now published as volume 25 of the *Gesamtausgabe*. Second, there is the famous *Kant and the Problem of Metaphysics*, published in 1930, shortly after the publication of *Being and Time*, and now issued as volume 3 of the *Gesamtausgabe*. Finally, there are the so-called Freiburg lectures, delivered in 1935/6, and now published as volume 41 of the *Gesamtausgabe*. Though this paper will bear almost exclusively upon the published Kant book of 1930, a word on the other texts is called for.

The Marburg lectures differ from the Kant book in a number of ways. First, Heidegger uses the Introduction not only to offer his own ontological interpretation of Kant's Introduction to the *Critique* but also to present his own conception of ontological phenomenology or, as he already terms it, of 'fundamental ontology'. Second, the main body of the text works out in much greater detail the specific points of Heidegger's Kant interpretation. Third, although the lectures conclude with a section on the schematism, volume 25 of the *Gesamtausgabe* really takes the exposition of Kant's text no further than the transcendental deduction. This latter limitation is made up in the Kant book which deals extensively with the schematism. Indeed, Heidegger goes so far as to claim that 'these eleven pages of the *Critique of Pure Reason* form the heart of the whole work'.⁴ However the Kant book, in its turn, does not carry the analysis into the *Analytic of Principles*, let alone the *Dialectic*. Again, in part this limitation is made up in the Freiburg lectures, now entitled *What is a Thing?*⁵ which focuses its Kant interpretation upon the second main section of the *Transcendental Analytic*, or, in other words, on the *Analytic of Principles*. Like the Marburg lectures (and unlike the Kant book), the Freiburg lectures begin rather than end with the explicit articulation of the ontological understanding that makes the work of interpretation possible.

In one sense therefore, these three major contributions to Heidegger's understanding of the Critical Philosophy could be seen as successive attempts to cover the entire corpus of the *Critique*, at least as far as the Dialectic. In fact however, these three works differ not just in scope or in detail but in their basic intention, not to mention the way in which they work out their respective intentions. Both the Marburg and the Freiburg lectures share a certain stylistic simplicity, the simplicity befitting the context of communication, that of a university lecture. And so both volumes of lectures open (rather than close) with an account of the philosophical orientation which establishes the context for the interpretation. But whereas Heidegger's Marburg lectures take their start in a presentation of the fundamental principles of phenomenological ontology in general, the Freiburg lectures take their start in a more specific question concerning the thing.

The relative difficulty of the Kant book is however due not to any incidental obscurantism but to certain *methodological* necessities, necessities imposed by the hermeneutical procedure itself, which is much more strictly adhered to in the Kant book than in the lectures. Whereas the lectures first offer an ontological interpretation of transcendental philosophy, or of the thing, and then go on to show how the relevant sections of the *Critique* confirm this interpretation, the Kant book stages the interpretative transformation in such a way that, starting fairly close to a recognizable rendering of Kant's intentions, Heidegger is able to move the Critical philosophy ever further away from any conventional rendering and in the direction of his own, ontological interpretation. This is why the Kant book is organized around four sections, each of which is entitled a 'Laying of the foundation' (the use of the concept of 'laying' carries with it an essential connection with the concept of 'laying out' which in German means interpretation – *Auslegung*). Instead of beginning with a section in which he sets out his interpretative hypotheses, he begins with a presentation of the traditional concept of metaphysics, the concept which, in a certain sense, Kant overcomes. To be sure, the possibility of a priori synthetic judgments is already laid out as the possibility of 'ontological knowledge', but this latter is still somewhat ambiguously expressed as the 'precursory comprehension of the being of the essent'.⁶ More significantly, it is in the fourth and last section (not the first section) that Heidegger develops, in what he calls a 'repetition', the ontological philosophy which was actually presupposed from the very beginning. In other words, the Kant book is organized in a manner calculated to highlight the procedure of interpretation itself.

But in order to see in what sense this is so, we first need to take a preliminary look at Heidegger's conception of the method of interpretation, as it is set out in *Being and Time*.

A The hermeneutical method

The sections in which Heidegger lays out his theory of understanding and interpretation are the three sections 31, 32 and 33. These sections are however not just thematically but also structurally integrated into the work as a whole. The basic division of *Being and Time* is into two parts, the first devoted to being, the second to time. The first part is itself organized around the basic structure being-in-the-world. The unitary configuration 'being-in-the-world' is split up, for analytical purposes, into its three constitutive components; the *world* (which is examined under the head of 'The worldhood of the world'), the one *who* is in the world (which is examined under the head of 'Being-with and being one's self'), and *being-in as such*. It is in the context of the third of these components, being-in as such, that we find the three sections in question here.

The question of interpretation is located in chapter V, for the simple reason that interpretation is here connected with understanding, one of four *existentialia* of which the other three are state-of-mind, falling and discourse. But although the correct procedure would seem to be to begin with an examination of the three *existentialia* which operate at the level of experience and to proceed on from there to an examination of their expression in and through language, this is not how Heidegger does actually proceed. Rather, state-of-mind and understanding are examined first as ontologically equi-primordial structures in which the Being of the 'there' maintains itself. Interpretation is then examined as a phenomenon grounded in understanding. The analysis of assertion arises as a derivative mode of interpretation, one moreover wherein the primordially of interpretation is covered over. The investigation of assertion then leads on naturally to an inquiry into language, more specifically, the grounding of language in discourse. Only after this discussion of language has been concluded is the everyday being of the 'there' presented in terms of the existential structure of falling which, appropriately enough, begins with an account of language as fallen, i.e., idle talk (*Gerede*).

The two sections (32 and 33) devoted explicitly to interpretation belong within the exposition of understanding. However, since interpretation is grounded in understanding and since the analysis of assertion is devoted to the levelling down of the primordial possibilities inherent in interpretation, it is the section on being-there as understanding (§31) and understanding and interpretation (§32) which are most relevant for our purposes.

Heidegger opens §31 with an explicit affirmation of the equi-primordially of state-of-mind and understanding. State-of-mind always has its understanding, and understanding always has its mood. In as much as *Dasein* is its 'there', the world is always there for it too. On the side of *Dasein*, being-in is disclosed to it as the 'for-the-sake-of-

which' (*Worumwillen*). On the side of the world, being is disclosed as significance (*Bedeutsamkeit*). 'Significance is that on the basis of which the world is disclosed as such.'⁷ Having recuperated, for his analysis of understanding, structures taken account of previously, Heidegger moves on to make the connection between the existential comprehension of understanding and possibility. Possibility, understood as potentiality for being, is explicitly contrasted with logical possibility or the contingent possibility of what is not actual but might be. 'Understanding is the existential Being of Dasein's own potentiality-for-being; and it is so in such a way that this Being discloses in itself what its Being is capable of.'⁸ In turn, potentiality-for-being is analysed out in terms of the structure of 'projection'. 'As projecting, understanding is the kind of Being of Dasein in which it *is* its possibilities as possibilities.'⁹ Further, projection of possibilities can be either authentic or inauthentic in so far as Dasein either does or does not understand itself out of the world in which it finds itself, or rather out of its own self as existing being-in-the-world.

Heidegger opens §32 with a reaffirmation of the connection between understanding, projection and possibility. 'As understanding, Dasein projects its Being upon possibilities.'¹⁰ But the theme of being-towards-possibilities is no sooner announced than it is qualified in a way which leads directly over into interpretation. This qualification is expressed in terms of the notion of a counterthrust (*Rückschlag*). That is to say, understanding, as projection of possibilities, encounters a resistance which forces it to develop itself in relation to. . . . The realization of possibilities of being does not consist in the mere projection of such possibilities but in the effective working out of such possibilities. The key concept in terms of which Heidegger analyses the essence of interpretation, as the development of understanding, is that of what he calls the 'as-structure'. That which is there for interpretative understanding is always taken 'as'. This hermeneutical 'as' is not to be understood as a signification which is thrown over the object. Rather, any involvement with entities encountered within the world is guided in advance by a prior understanding which can be articulated in terms of three fore-structures – fore-having, fore-sight and fore-conception. In so far as meaning gets its structure from a fore-having, a fore-sight and a fore-conception, and in so far as meaning is that in terms of which the intelligibility of something maintains itself, it follows that whatever is understood 'as' is not *discovered* to possess such a meaning but is always already understood in terms of just such a meaning structure. Hence, interpretation necessarily moves in a circle. That which one *seeks* to understand has always already been understood in advance, though this understanding in advance may not have, and usually has not, been rendered thematic. So far from such a circle proving vicious (*circulus vitiosus*) and as such to be avoided, it is only in so far as interpretation

gets into the hermeneutical circle in the right way that the understanding which is thereby developed can assume the form of a genuinely primordial kind of knowing.

In these sections on understanding and interpretation the primary objective is to lay out that sense of interpretation which is relevant to an understanding of entities encountered within the world, or indeed of the world itself. However, there are passages in which Heidegger moves from the plane of being to that of textual interpretation. That such a move is called for is of course founded in the fact that the ontological articulation of understanding itself results in a text which must be interpreted in order to be understood. Unfortunately however, the principal passage in which Heidegger talks about textual interpretation is one wherein he restricts himself to a negative critique of a supposedly presuppositionless understanding.

If, when one is engaged in a particular concrete kind of interpretation, in the sense of exact textual Interpretation, one likes to appeal to what 'stands there', then one finds that what 'stands there' in the first instance is nothing other than the obvious undiscussed assumption of the person who does the interpreting.¹¹

However, this brief and indecisive passage will suffice to furnish us with a clue as to the way in which interpretation takes place at the level of the text.

An inauthentic understanding of a text is one in which the interpreter simply assumes that there is something there to be understood and that such an understanding not only can be, but ought to be undertaken in abstraction from the 'being-there' of the one who interprets. By contrast, authentic understanding of a text occurs when the interpreter recognizes the inevitability of pre-conceptions, which pre-conceptions can however be made explicit in the course of the interpretation and in such a way that, in working out an understanding of the text, the interpreter also comes to an understanding of himself or herself as the one undertaking the interpretation. Textual interpretation is, for Dasein in general, just one among many other possibilities of being and indeed one of the least significant. For the philosopher however, that is, for the one for whom an understanding of the essence of interpretation is of critical significance, textual interpretation assumes a privileged position. For it is precisely through an understanding of the texts of other philosophers that a philosopher develops his or her own self-understanding and in so doing finds him or herself in a position to lay out this self-understanding explicitly in the form of a philosophy. In turn, this 'philosophy', as the explicit working out of primordial possibilities inherent in the being-there of the

philosopher, will serve as the predetermined framework for any further textual interpretation.

With this remove to the level of textual interpretation, we find ourselves upon the plane required to come to terms with Heidegger's Kant interpretation. The interpreter always and invariably comes to a text with certain theoretical presuppositions. The task of interpretation will require that he *neither* simply let these presuppositions direct the work of interpretation in an unselfconscious fashion (that is, without any recognition of the presuppositions as such), *nor yet* that he attempt to suppress these presuppositions in the interests of a neutral, detached and so impartial, assessment. For Heidegger, the latter attitude is an interpretative attitude like any other and already involves a projective decision which is all the more insidious for being unrecognizable as such.

A much more complicated interaction between interpreter and text comes to take the place of these two *naïve* approaches. First, the interpreter must hold himself open to the text, receive the meaning conveyed in the reading of the text and make sense of it in *its own* (not yet *his own*) terms. In a second moment, he must respond to the text in a manner which is implicitly guided by his own 'pre-ontological understanding'. In a third and final moment, he must seek to build into the unity of a distinctive viewpoint the insights engendered through his interaction with the text, insights peculiar to his own way of reading the text. What comes at the end is therefore only the explicit articulation of what was already there implicitly from the beginning. This, I suggest, was the kind of procedure involved in Heidegger's own interpretation of Kant's text.

B The Kant book

But why then did Heidegger never say that, in his Kant book, it was his intention to subject the Critical philosophy to an interpretative procedure which would make it possible for him to bring to light structures which match and reflect the fundamental structures of *Being and Time*? This is no idle question. For although Heidegger must have known what it was he was trying to accomplish, he never really acknowledges that *this* is what he is doing but rather indicates, repeatedly, that his own *highly idiosyncratic* interpretation represents *the* revelation of Kant's most basic intentions. 'The fundamental purpose of the present interpretation of the *Critique of Pure Reason* is to reveal the basic import of this work by bringing out what Kant "intended to say".'¹² Implied in statements of this kind is a claim to the effect that Kant's basic intention had *never before* been recognized as such, since never before had a critic attempted anything like an ontological interpretation of the *Critique*. Later on we

shall try to evaluate this claim. For the moment, it will suffice to consider how he goes about the work of interpretation.

There are three movements going on simultaneously throughout the entire Kant book. The first is a movement *forward* in the expository treatment of the *Critique of Pure Reason*. Heidegger does not stick rigidly to this agenda. But, on the whole, his interpretation proceeds through the *Critique* in the order in which it was written. Second, there is a movement *back* in the direction of an ever more primordial, or original, interpretation of the *Critique*. Hence, the 'violence' which Heidegger does to the text tends to increase with each succeeding section as his interpretation comes ever closer to that conception of metaphysics which is his own rather than Kant's. And finally, we find what might be called a movement *around*, a circular movement which reproduces the directives of the hermeneutical circle itself. That comprehension of the project of metaphysics which is simply assumed in a preliminary way at the very beginning gets eventually set out in the last section as the result of what Heidegger calls a 'repetition'.

The Kant book is set out in four sections with the rather resounding titles: (1) 'The point of departure of the laying of the foundation of metaphysics'; (2) 'The carrying out of the laying of the foundation of metaphysics'; (3) 'The laying of the foundations of metaphysics in its basic originality'; and (4) 'The laying of the foundation of metaphysics in a repetition'. The recuperation of the Kantian architectonic in an architectural metaphor ('Laying of the foundation') is not only deliberate but serves to emphasize the importance of Heidegger's specifically ontological interpretation. The *teleological* mode of Kant's transcendental investigation (where the 'step back' is in the direction of a higher, transcendental realm) is transposed in an *archeological* direction, thereby becoming an inquiry into the *arche*, the origin or ground of knowledge.

Heidegger opens his analysis with a distinction drawn from school metaphysics. The point of recurring to the distinction between *metaphysica generalis* and *metaphysica specialis* is however only to show how the latter leads on to the former through the typically Kantian 'Copernican revolution', as a result of which one of the branches of *metaphysica specialis*, namely, the study of man (the other two being God and Nature) becomes the foundation upon which the entire inquiry into being in general is based. In what sense this is so is made plain in the next section in which Heidegger interprets the possibility of a priori synthetic judgments (as presented in Kant's own Introduction) as the possibility of the precursory comprehension of the being of the essent. Thus, from the very outset, Kant's *transcendental* investigation is interpreted as a body of *ontological* knowledge, indeed as a *Daseins analytik*.

This is particularly evident in those passages in which Heidegger interprets the transcendental character of the *Critique* in terms of the

phenomenological problematic of transcendence and, moreover, interprets the latter in an ontological rather than a transcendental manner. Taking B 25 as his text ('I entitled *transcendental* knowledge all knowledge which is occupied not so much with objects as with the mode of our knowledge of objects in so far as this mode of knowledge is to be possible *a priori*') Heidegger interprets as follows:

Thus transcendental knowledge does not investigate the essent itself but the possibility of the precursory comprehension of the being of the essent. It concerns reason's passing beyond [transcendence] to the essent so that experience can be rendered adequate to the latter as its possible object.¹³

Section 2 forms the core of the work and indeed covers the greater part of the *Critique* from the Transcendental Aesthetic and the Logic through the Transcendental Analytic and so on to the Highest Principle of All Synthetic Judgments. It is divided into two parts (A and B), the first of which is concerned with establishing a thesis with regard to the finitude of human knowledge. Not only does §2 *begin* with a preliminary specification of the two sources of knowledge (intuition and understanding), but Heidegger also uses this preliminary specification to announce the primacy of the former over the latter. 'Thinking is simply in the service of intuition.'¹⁴ Intuition stands in an essential dependence upon the object and can only reveal what is already there to be intuited. That this dependence upon the object is not intrinsic to intuition as such but is a mark of the finitude of our human intuition is brought out by way of a contrast with divine intuition, i.e., *intuitus originarius*. Human, as opposed to divine, intuition is non-creative. Non-creative intuition furnishes understanding with a material from which first concepts and then judgments can be composed. But no matter how remote from its source finite knowledge may proceed it always stands in an essential dependence upon intuition and therefore upon objects which must first be received in sense before they can be understood.

An interesting interpretation of Kant's concept of the thing in itself serves to reinforce yet again the ontological character of Heidegger's interpretation. Drawing upon a citation from the *opus postumum* where Kant suggests that the thing in itself is not something different from the appearance but merely the same thing viewed under a different aspect, Heidegger argues that what lies 'behind' the appearance (*qua* thing-in-itself) should be interpreted not as what lies 'beyond' the appearance (in a transcendent sense) but rather as what lies concealed in the revealing characteristic of the appearance.

The preliminary affirmation of the finitude of human knowledge calls in question the legitimacy of the very possibility of metaphysics in so far

as it has already been defined in terms of the precursory, experience-free knowledge of the ontological structure of the essent. Thus the original question as to the possibility of the a priori synthesis narrows down to this: 'How can a finite being which as such is delivered up to the essence and dependent on its reception have knowledge of, i.e., intuit, the essent before it is given without being its creator?'¹⁵ Understanding forms its concepts from itself and therefore functions as an autonomous faculty, save in so far as its material is drawn from intuition. Unless therefore intuition can furnish a material from itself, that is, without receiving it from objects, the project of ontological knowledge will fall to the ground. In accordance with this requirement, space and time are then disclosed as two pure intuitions which are capable of generating a manifold of pure intuition spontaneously. Although his presentation of the two pure forms of intuition is at this point entirely provisional (as is Kant's own presentation in the *Aesthetic*) Heidegger advises us in advance that, in the course of the laying of the foundation of metaphysics, time will come to dominate more and more.

For the time being however, it is not so much time as the imagination which is brought to the fore. The isolation of intuition and understanding and, more significantly, of pure intuition and pure understanding raises the question of how these two faculties join together to make knowledge (both ontic and ontological) possible. Pure intuition, as pure, and pure understanding, as pure, are, as it were, already appropriate to a synthesis in which they should co-operate. But since intuition is a sensible faculty and understanding an intellectual faculty, the synthesis of the two cannot be understood in terms of the intrinsic nature of these two faculties in and of themselves. Something else is needed. Although the first introduction of the faculty of imagination is entirely provisional, still, from the first, Kant does introduce imagination as a faculty of synthesis.

Synthesis in general, as we shall hereafter see, is the mere result of the power of the imagination, a blind but indispensable function of the soul, without which we should have no knowledge whatsoever but of the existence of which we are scarcely ever conscious.¹⁶

Heidegger makes a double use of this citation, to bring out the synthetic character of the imagination and to bring out its essential primordially. The primordially of the imagination, which is only indicated here by the *obscurity* of the workings of the imagination, is further reinforced with reference to the metaphor of a root which puts out two branches.

It would take us too far out of our way to consider in detail how Heidegger establishes his case. It is worth noting however that, quite characteristically, he proceeds in a series of stages each of which represents a further step back in the direction of the ground. He begins by

acknowledging pure intuition and pure thought as the *two essential elements* of pure knowledge. He then enquires into that *unity* of pure knowledge which is made possible by the imagination. He then enquires into the *intrinsic possibility* of this very unity. His analysis, which focuses largely upon the A Edition of the Deduction, accomplishes amongst other things a necessary devaluation of the faculty of apperception (the other obviously unifying faculty) in favour of the imagination. He then goes on to examine the schematism which he terms the 'heart of the whole work'¹⁷ and which he interprets as establishing the *ground* of the intrinsic possibility of the unity of pure ontological knowledge. Finally, and as a sort of summation of all that has gone on before, he uses the Highest Principle of All Synthetic Judgments to effect a *complete determination* of the essence of ontological knowledge.

The third section is the place where, according to Cassirer, Heidegger no longer speaks as a commentator but as a 'usurper'. This third section is divided into three parts but, effectively, the division is into two, a first part focusing upon the faculty of the imagination as the ground of unity and a second part devoted to time – *Being and Time*. In part A, Heidegger investigates the formative and unifying capacity of the imagination – the imagination as forming the horizon of objectivity in general, as unifying intuition and thought and as furnishing the root of that structure of transcendence through which the elements are not only unified originally but spring forth in their derivative separation. In part B he effects a truly extraordinary derivation of all the other faculties from the imagination. Pure intuition is shown to be, essentially, imagination (§28). Pure theoretical reason is shown to be, in essence, imagination (§29). Pure practical reason is shown to be, fundamentally, imagination (§30).

In part C, Heidegger begins by taking the previous analysis one step further. The transcendental imagination is shown to be primordial time. There follows a fascinating interpretation of the temporal character of the triple synthesis whereby each of the three dimensions of the triple synthesis is aligned with a different dimension of time – the synthesis of apprehension with the present, the synthesis of reproduction with the past and the synthesis of recognition with the future, an alignment which immediately reminds us of the corresponding strategy in *Being and Time*, where each of three *existentialia* (understanding/mood/falling) is aligned with a different dimension of time. Finally, Heidegger connects time with the self in such a way that the self is shown to be temporal in its being.

In the fourth and last section, Heidegger draws all the conclusions which follow from the analysis conducted up to that point. More specifically, he draws from his previous analyses conclusions which align the *Critique*, fairly straightforwardly, with the metaphysical project attempted in *Being and Time*. He begins by introducing the concept of a repetition. 'By a repetition of a fundamental problem', he tells us, 'we understand

the disclosure of the primordial possibilities concealed in it.¹⁸ The key word here is 'possibilities'. For the previous analyses have revealed the transcendental imagination as the ground of the intrinsic possibility of the ontological synthesis, i.e., transcendence. But no sooner does he state this result than he insists that the result is not what has actually transpired in the course of the interpretation. Instead, he broadens the discussion to the point that the laying of the foundation can be seen as the establishment of metaphysics as anthropology, to be sure, a philosophical anthropology which, as such, can have nothing to do with any empirical study of Man.

And right away the discussion is now set on a tack which will permit Heidegger to introduce all the central themes of his Dasein's analysis, which now becomes that philosophical anthropology towards which all the interpretative analyses have been tending. Thus the repetition of the primordial possibilities inherent in the Critical philosophy turns out to be a reproduction of the central theses of *Being and Time*. It would be pointless to go through this reproductive procedure in detail. Suffice it to say that, in this fourth and final section, we find, yet again, the finitude of human being, as also the definition of the being of Dasein in terms of existence and being-in-the-world, the temporality of Dasein, the structure of projection, the concepts of forgetfulness and re-membering, of care and anxiety. We seem to be worlds away from Kant, and yet it is this move away from Kant which permits Heidegger to rejoin the themes first announced at the very beginning of the study where he talked of the traditional concept of metaphysics and its division into *metaphysica generalis* and *metaphysica specialis*. This closing of the circle is a typically Heideggerian move and sets his signature upon the entire study.

In order to hammer home even more forcefully the parallel between *Being and Time* and the Kant book, it would be worth reproducing briefly the successive stages of this repetition. The Introduction to *Being and Time* is devoted to an exposition of Heidegger's new conception of phenomenology and, as such, lies outside the scope of the parallel. The first section of Part One (devoted to Being) introduces the notion of a philosophical anthropology as the analytic of Dasein and so corresponds to the analysis of the relation of *metaphysica generalis* to *metaphysica specialis*. The second section introduces the unitary configuration being-in-the-world as the leading theme. This corresponds, in the Kant book, to the ontological interpretation of Kant's question: how are a priori synthetic judgments possible? in terms of the problematic of transcendence. In the third, fourth and fifth sections the unitary configuration being-in-the-world is broken up into its constituent components, the world in which (the Worldhood of the world) the *self* which is in (the Who) and *being-in* as such. In the Kant book, this corresponds to the resolution of the question concerning the possibility of ontological

knowledge, or transcendence, into the component elements which make up the faculty theory of knowledge, more specifically, intuition and understanding. In the first instance the co-operation (i.e., the ontological unity) of these two faculties is explained in terms of the imagination as a 'between'. But in the second instance this 'between' of the two essential components is re-presented as a 'beneath' of the between. Imagination is shown to be capable of connecting intuition and understanding only because it functions as the primordial root from which the two derivative branches stem. This second step corresponds to what is accomplished in *Being and Time* when being-in as such is grounded in the structure of care. And it brings the analysis developed under the auspices of being to a close. Part Two of *Being and Time* is devoted to a temporalization of the structures disclosed in the course of the previous analysis of Dasein. This corresponds, in the Kant book, to the analyses devoted to the temporalization of the fundamentally unifying function of the imagination and to the gradual emergence of time as the primary theme of the *Critique*.

C Transformational hermeneutics

In this third part of my paper, I want to bring out the limitations of Heidegger's Kant interpretation and to draw alternative conclusions from these same limitations. In so doing, I hope to turn against Heidegger the very sentiment which he expressed when he justified his own interpretation in the light of the Kantian phrase 'understanding a thinker better than he understood himself'.

What is to me most surprising about the way in which Heidegger goes about his business in the Kant book is that, despite the hermeneutical revolution for which he was himself in large part responsible, he *still* tends to depict his interpretation as the real, the underlying, the conclusive truth of the *Critique*. For example, in the second section, he writes: 'To lay the foundation of metaphysics in totality is to reveal the internal possibility of ontology. Such is the true sense of that which, under the heading of Kant's "Copernican revolution", has been constantly misinterpreted.'¹⁹ Such passages are to be found all over the book, for example, where he writes: 'All transformation of the pure imagination into a function of pure thought is the result of a misunderstanding of the true nature of the pure imagination',²⁰ or again: 'The fundamental purpose of the present interpretation of the *Critique of Pure Reason* is to reveal the basic import of this work by bringing out what Kant "intended to say".'²¹ Why could he not have presented his interpretation as an interpretation, that is, as a *possible* way of envisaging the *Critique*, a way confirmed and justified by the ontological phenomenology set out

in *Being and Time*? Could it be that he was afraid of not being taken seriously if he did not present his interpretation in the same *definitive* manner as most other commentators? But then, by the time he came to write his Kant book, he was already a philosopher of international stature, one who moreover, from the very beginning, never ceased to claim for the thinker, as opposed to the scholar or the critic, special prerogatives. Notoriously, some of the worst comments made upon historical philosophers are made by the most creative thinkers (one thinks of Kant's own remarks on Leibniz or Locke or Berkeley), worst because, effectively, the thinker presents his predecessors as attempting, unsuccessfully, to do what he himself has succeeded in doing effectively – in Kant's case as proto-Critical philosophers. It is not the violence done to the texts of historical philosophers which is worrisome but the fact that the interpreters seem to have been blissfully oblivious of the violence they had themselves inflicted. Here Heidegger could have worked a salutary corrective had he not proceeded *in the same way*, affirming his own interpretation as the *correct* understanding and dismissing other, often much more orthodox interpretations, as *misinterpretations*.

There are two particularly unorthodox biases expressed in the Kant book. The first is his dismissal of any epistemological interpretation of the Critique. 'The purpose of the *Critique of Pure Reason*', he tells us, 'is completely misunderstood, therefore, if this work is interpreted as a "theory of experience" or perhaps as a theory of the positive sciences. The *Critique of Pure Reason* has nothing to do with a "theory of knowledge".'²² In view of the fact that most of the analytical interpretations of the Critique (which means almost all of the studies written in English) do assume that the Critique is, above all else, a theory of knowledge, Heidegger's heresy comes as a refreshing corrective. But it implies a quasi-total rejection of almost everything that has ever been written on the *Critique of Pure Reason*, by far the greater part of which does at least assume that this work has *something* if not *everything*, to do with epistemology. By simply replacing one bias with another, he called in question the most valuable legacy of the hermeneutical revolution, the explicit recognition of the unavoidability of multiple interpretations.

The second, extra-ordinary bias expressed in the Kant study consists in his *identification* of transcendental philosophy with ontology. Again, this standpoint is to be found throughout the study but it is found expressed in a particularly sharp and clear-cut fashion in a passage where he writes: 'the laying of the foundation of ontological knowledge strives to elucidate this transcendence in such a way that it can be developed into a systematic whole (transcendental philosophy = ontology).'²³ Or again: 'For Kant, what matters above all, is the revelation of transcendence in order thus to elucidate the essence of transcendental (ontological) knowledge.'²⁴

Moreover, this hermeneutical identification of transcendental with ontological phenomenology is only a repetition (or application) of the position already assumed in *Being and Time*, as is evident from the following passage from the Introduction. 'With regard to its subject-matter, phenomenology is the science of the being of entities – ontology.'²⁵ Heidegger might have chosen to present his phenomenology as an alternative to, or indeed as the complement of, Husserl's transcendental phenomenology. Instead, he re-defines phenomenology in such a way that it becomes (at least for him) equivalent to ontology. Could it have been respect for his master which led Heidegger to reduce his critical comments upon Husserlian phenomenology to the minimum?²⁶ Effectively however, the absence of any explicit attack upon Husserlian positions need not leave us in any doubt as to his intentions. For the battle with transcendental philosophy, a battle which might have been waged upon the Husserlian field, was in fact fought out against Kant. So Heidegger's transformation of Kant's transcendental philosophy into ontology must be seen alongside his attempt to win his freedom from Husserlian phenomenology by first carving out, from within the Husserlian domain, an ontological preserve of his own and then *extending* the bounds of this preserve until it came to coincide with the discipline of phenomenology in general – thereby excluding the Husserlian conception altogether.

In my Kant book, I took as the starting point for my own ontological interpretation of the *Critique* these evident inadequacies of Heidegger's interpretative position. I asked myself whether it might not be possible to effect a series of presentations of the *Critique*, each of which would represent a different way of interpreting the *Critique*. And further, I asked myself whether it might not be possible to set out these different interpretations not just in what might be called a 'lateral' frame of reference, as so many alternatives to be juxtaposed one alongside the other, but rather in an integrated succession. In other words, I asked myself whether it might not be possible to lay out the successive presentations in such a way that any given presentation might be seen as the necessary pre-condition for its successor, and so that the interpretation which ensued would display a *logic of the transformation* of one presentation into another.

Merely by refusing the Heideggerian exclusion of any epistemological and any distinctively transcendental interpretation of the *Critique* whilst, at the same time, accepting the Heideggerian ontological interpretation, I was able to generate three distinct ways of interpreting the *Critique*, an epistemological, a transcendental and an ontological. However, like Heidegger, I had an end-point in mind, a goal towards which the entire interpretative transformation would be directed and which would both make explicit, and so also confirm, the standpoint from which the entire

work of interpretation was undertaken. This presupposed end-point, or goal, consisted in what I call a 'genetic ontology'. The idea of a genetic ontology was based upon a developmental conception of phenomenological philosophy which, as such, would move through the several stages represented by the three methodologies of epistemology, transcendental philosophy and ontology, and so would be capable of integrating these three methodologies in one unitary frame of reference.

The goal to be attained in turn recommended an alternation between a static and a genetic procedure, and this not merely at the end but along the way to the end. Since the interpretative method employed by Heidegger turns largely upon Kant's faculty theory, it proved necessary to define the distinction between a static and a genetic procedure in terms of just such a faculty theory. A static procedure was defined as one based upon the *simultaneous co-operation* of the fundamental faculties, a genetic procedure, by contrast, was defined as one based upon the *successive instantiation* of the fundamental faculties.²⁷

The interpretative schema made possible by the recognition of the three methodologies, together with the alternation between a static and a genetic procedure is one which, in principle, generates six alternative ways of viewing the *Critique*: ontico-static (analytical epistemology) ontico-genetic (genetic epistemology), phenomenologico-genetic (Hegelian phenomenology), phenomenologico-static (Husserlian phenomenology), ontologico-static (Heideggerian ontology) and finally ontologico-genetic.

By the very nature of things, an *ontic* presentation is one which does not venture beyond the objective plane or which, when it does so, only does so by way of a regressive question into the *conditions of the possibility* of what is already actual. In the light of such a venture, the faculty of understanding has to be taken (more or less as we find it in the Transcendental Logic) as the faculty representative of the higher faculties in general,²⁸ and the scope of Kant's transcendental argumentation is consequently strictly limited to a regressive question concerning the *sine qua non* of what is empirically actual, namely, an already constructed experience of objects. With regard to the possibility of an *ontico-genetic* investigation, we find, interestingly enough, in Piaget's child psychology, a genetic epistemology which exhibits a three-step genesis (sensori-motor, concrete and formal operations) and which also assumes that formal thought figures at the apex of the entire epistemological hierarchy (The Highest Principle of all Analytic Judgments). Indeed, a Piagetian genetic epistemology might have been used to investigate the process by which an objective reality is constructed in the first place.²⁹ However, precisely because this kind of genetic epistemology utilizes a *psychological* rather than a *philosophical* method, I made no attempt to interpret the Critical philosophy in this manner. Instead, I used the Hegelian progression (basic to the organization of parts A and B of the *Phenomenology of*

Spirit) from sense, through understanding, to self-consciousness (apperception?³⁰) to carry the interpretation out of the objective sphere (broadly defined) and into the sphere of a properly reflective consciousness (*phenomenologico-genetic* presentation). Thereafter, and along lines which are already prefigured in Heidegger's interpretation, understanding disappears as one of the fundamental faculties.³¹ Its place, as the highest faculty, is now taken by apperception (in relation to pure imagination and to pure intuition).

From this point on, the Critical project is resumed upon a strictly transcendental plane through an examination of the inter-relation of the three transcendental faculties of apperception, imagination and intuition³² and with a view to instituting a transcendental phenomenological interpretation of the faculty theory. This kind of comparison (between Kant and Husserl) is one which is familiar to the literature from Iso Kern's study of *Kant and Husserl*. However, whereas, by and large, Kern's procedure consists in bringing out the *differences* between the two great transcendental philosophers from a standpoint outside the two main bodies of thought, my method consists in finding affinities through a work of interpretation which seeks to view Kant from a Husserlian standpoint.

In order to bring out the Husserlian character of the kind of transcendental analyses conducted by Kant (especially in the A edition of the Deduction), the distinction between appearance and representation has to be interpreted in such a way as to bring to light something in the order of a phenomenological reduction.³³ An appearance is always the appearance of something (substance) which does not itself appear in the appearing, and in this sense presupposes the existence of just such a something. But a representation is so constituted that nothing may correspond to what is represented, *vorgestellt*, or held *before* consciousness. Thus the concept of representation is indicative of the disclosure of a sphere of immanence within which, and within which alone, a principle of transcendence can, and has to be, found. Second, in place of the analytic or regressive procedure (from the conditioned to the condition of its possibility), appropriate to the epistemological interpretation, the emphasis is switched to the synthetic or progressive procedure (from the condition to the conditioned) in order to exhibit the constitutive capacity of the analyses conducted in the Deduction. This synthetic or progressive procedure can be justified with regard to the so-called 'subjective deduction'³⁴ and yields an understanding of Kant's enquiry into the objectivity of experience which already anticipates Husserlian phenomenology.

Perhaps the most obvious indication of such an affinity is to be found in the concept of the 'transcendental object', a concept which is only to be found in the A edition of the Deduction. This concept of the transcendental object mediates between two alternatives, one of which, one might

say, creates too great a distance between appearance and reality while the other brings the two too close to each other. The transcendental object is not a *thing in itself* lying over and beyond the limits of sensible experience but precisely something which manifests itself in and through appearances. On the other hand, the transcendental object is not to be reduced to the epistemological notion of *substance, qua appearance*. Thus, by neither overstepping the bounds of the phenomenal nor yet reducing the phenomenal to the substantial, as *substrate of appearance*, Kant opens up a way of envisaging the essential unity of a manifold of appearances which leads straight into Husserlian phenomenology. There can be no doubt that Husserl had the Kantian model in mind when, in *Ideas I*, the text in which he made his major breakthrough into transcendental phenomenology, he (Husserl) took over, at a critical point, the Kantian terminology of a transcendental object.³⁵

However, the point of carrying through a phenomenologico-static presentation is not just to re-construct the *Critique* along strictly transcendental lines but to lay the basis for what I call an 'ontological transposition'. It is a central contention of my Kant interpretation that an ontological interpretation of the *Critique* can only be arrived at by 'transposing' or carrying over the transcendental dimension of the fundamental faculties into an inverted ontological mode. This is effectively what Heidegger did when, for example, he interpreted the a priori synthesis as a precursory comprehension of the horizon of objectivity in general – but without acknowledging the source from which this ontological derivation actually stems. Thus instead of simply interpreting transcendental truth as ontological fore-knowledge, from the very outset, I prefer to make a distinction between the a priori and the genuinely *prior*. By an a priori investigation is meant the *ultimately conclusive* disclosure of those structures of consciousness which make the objectivity of an already constructed experience possible. By an investigation into the *prior* construction of experience is meant a *genuinely original* enquiry into the process by which such an experience gets built up in the first place. Thus, the opposition a priori–prior goes along with such equivalent oppositions as found–ground, constitute–construct, all of which not only permit a distinction between an ontological and a transcendental interpretation of the *Critique* but also allow for the establishment of an essential connection between these two, sharply contrasted, interpretations.

For instance, Kant's theory of space and time effects a reversal of the conventional conception of space and time as frames of reference for that in which we find ourselves. Instead of thinking of ourselves as situated in space and time, Kant invites us to think of space and time as situated 'in us'. But this 'being in us' of space and time is susceptible to a double interpretation, the one characteristically transcendental, the other characteristically ontological. Space and time may be 'in us', as

forms of the mind. Alternatively, we may conceive of ourselves as spatial and temporal in *our very being*. The pure forms of space and time which are initially interpreted along more conventionally Kantian lines as pure forms 'in the mind' are finally interpreted along ontological lines to mean embodiment (the body as the space that is in me) and action (the temporalization of my being as a body).

Strictly speaking, this means, in the end, that the ontological domain will figure twice. In the first instance, the pure forms will function as so many practical structures ('schemas of action' to use a Piagetian terminology) through whose operations an objective reality is constructed in the first place, of course, in a wholly immediate and unreflected fashion. Once an objective reality has been constructed, it can then be subjected to analysis. The philosophical methodology appropriate to the investigation of such an already constructed reality is epistemology. Transcendental philosophy emerges, in the first instance, as radical epistemology, an epistemology that opens up the distinction between the empirical and the transcendental in order precisely to trace the objectivity of the object back to constitutive structures of consciousness. This reduction *to* consciousness brings about the 'destruction' of an already constructed reality, a destruction which prepares the way for something in the order of a 're-construction'. In this sense, what is ordinarily thought of as 'phenomenological constitution' comes to take on the meaning of a 're-construction'. Only in the light of just such a transcendental philosophical project does a properly ontological philosophy become possible. And the task of such a philosophy consists then in the attempt to bring to full self-conscious awareness those very processes and procedures which were originally responsible for the construction of that very reality which forms the starting point of any transcendental investigation.

Simply to articulate such a programme is however already implicitly to be committed to an ontologico-genetic interpretation, not merely of the *Critique*, but also of the several methodologies brought to light in the course of the attempt to articulate all the various ways in which the Critical philosophy can be interpreted. Interestingly, this new ontologico-genetic presentation can be represented as an extension of the phenomenologico-genetic presentation. Since the latter carries the analysis from an objective to a reflective plane, and since the more specifically Husserlian phenomenological interpretation leads on to an (Heideggerian) ontological conception, this latter (the last in the order of analysis) can, in turn, be regarded as the first (in the order of being) stage in a three-stage genesis which moves *from* the ontological, *through* the epistemological and so on *to* the transcendental stage.

Such a programme of *interpretative transformation* is, by the very nature of things, *much more complex* than that carried out by Heidegger. And

so a question arises as to whether the effort involved (not to mention the violence done to the text) can be justified in the light of the conclusions that can be drawn therefrom. And here I would simply like to offer a few concluding remarks.

First, the richness of Kant's thinking becomes a positive force to be reckoned with, not a negative factor to be explained away. Kant has often been criticized for the apparent contradictions which abound in the *Critique*. In my view, many of Kant's central concepts should be treated as symbols rather than concepts, symbols in the sense that they unify in one term a multiplicity of meaning and so offer a context for textual interpretation – 'le symbole donne à penser', to use Ricoeur's apposite phrase. This multiplicity of meaning must remain confusing unless and until it can be disentangled. A disentangling of the multivocity of certain central concepts is already effected in as much as the concepts in question are assigned to different theoretical contexts, contexts in which their distinct meanings are separately voiced. Thus each presentation can be regarded as an internally consistent configuration, many of whose key terms will, in the context of other configurations, acquire meanings which may not be consistent with the meaning they assume in the given context.

Second, the exclusively ontological orientation of Heidegger's interpretation forces him to devalue, indeed virtually to disqualify, the faculty of apperception in favour of imagination. And yet, on the face of it, apperception is not only presented by Kant as the highest faculty but as the unifying faculty *par excellence*. Kant calls this key faculty the transcendental unity of apperception and, as such, it possesses two distinctive traits. It represents the highest unity of consciousness on the one hand and the reflective self-identity of consciousness on the other. Moreover, as that self-identity ($I = I$) which identifies itself with the unity of consciousness, it is also the faculty primarily responsible for integrating the other fundamental faculties within itself. Whereas Heidegger's interpretation concentrates upon the imagination to the *exclusion* of apperception, an interpretation which accords a pivotal role to apperception will also be one which is required to take account of the *inclusion* of intuition and imagination under apperception in the general structure of an a priori synthesis. Moreover, and thanks to the structure of an ontological transposition, apperception is required to figure *both* as a transcendental *and also* as an ontological faculty. The highest founding faculty becomes the lowest grounding faculty. Unification from above is converted into unification from below. Thus, the substance of Heidegger's own ontological interpretation is retained but in a way that does justice to the dominant role of the faculty of apperception.³⁶

The dismissal of apperception belongs along with Heidegger's more general depreciation of transcendental philosophy. And this brings with it implications which far transcend the scope of his Kant interpretation.

For instance, it helps to explain Heidegger's tendency to interpret the history of Western philosophy as leading up to and so becoming consummated in technology. Technological thinking is thinking in view of a manipulative practice, and we are becoming ever more aware of the dangers which attend an uncritical extension of calculative-manipulative thinking. But by substituting his own ontological, for Husserl's transcendental, phenomenology, Heidegger failed to take account of the sense in which Husserl's phenomenology is already an overcoming of calculative-manipulative thinking and perhaps a more effective overcoming than that represented by the recollective (*andenkende*) thinking of late Heidegger. To be sure, Husserl's phenomenology radicalizes, and indeed *absolutizes*, the sphere of subjectivity. But the transcendental subjectivity which emerges therefrom is anything but calculative or manipulative in intent. Indeed, in his late work *Crisis*, Husserl traced many of the aberrations of the times through which he was then living to a naive regression to wilful partiality and held out, as a redeeming hope, the classical ideal of a purely disinterested, theoretical reason. Not only is this ideal dismissed by Heidegger and his disciples as a product of subjectivism, the other great subjectivist ideal, the ontologico-theological ideal of an absolute knowledge or, at least, an absolute spirituality is also disqualified (see Souche-Dagues, chap. 25, vol. II in the present work).

Coupled with this dismissal of the spirit and intent of transcendental philosophy there goes a depreciation of its ethical implications. Cassirer, in his debate with Heidegger, was quick to fasten upon this feature of Heidegger's Kant interpretation – as Pierre Aubenque has shown in his paper on the subject (chap. 23, vol. II in the present work). Though, on the surface, it might not seem that Husserl had much to say on the subject of ethics, those who are familiar with what, to my way of thinking, represents one of the very greatest contributions to ethical theory of this century, Scheler's *Materiale Wertethik*, will know how deeply indebted Scheler was to transcendental philosophy in general (the first part of Scheler's work is devoted to a critique of Kant's formalistic ethics) and to phenomenological philosophy in particular.³⁷

The kind of interpretation which I undertook in my Kant book seems to me to come closer to the spirit, and the theoretical ambitions, of the hermeneutical revolution than does Heidegger's own version. First, the working out of a multiplicity of alternative presentations forces upon the reader an awareness of that very 'as-structure' in terms of which Heidegger laid out his own theory of interpretation. Whoever says interpretation says *more than one* possible way of understanding. It is precisely this multiplicity which is missing from the Heideggerian account. But the question is whether the recognition of multiple possibilities of understanding means that the work of interpretation is committed to the necessity of *indefinitely many* alternative ways of understanding – in

which case we would seem to have avoided the naive conclusiveness of *one* for the chaotic inconclusiveness of *many*. By generating a *finite* number of alternative presentations in accordance with a *well-defined* principle, and by staging the succession of presentations in such a way that something like a *logic of the genesis* of one presentation from another emerges in the course of the interpretative transformation, it becomes possible to envisage the presentations in question as forming a *systematic totality* which effectively exhausts all the methodological possibilities available to the work of interpretation.

Finally, this methodological logic is one which not only describes a circle and but which also finishes up by closing the circle, and this in a double sense. At the specific level of textual interpretation, the fore-knowledge which was presupposed in advance is eventually laid out as the goal towards which the several steps of the interpretative transformation tends throughout. In this sense, my own interpretative transformation moves in the same direction as Heidegger's ontological interpretation. At a much more general level however, a thesis is developed with regard to the respective relations of epistemology, transcendental philosophy and ontology, which are now themselves shown to move in a circle, and precisely because, in a certain sense, ontology figures twice, as the *first* in the order of being and as the *last* in the order of analysis. Heidegger's distinction between a pre-ontological way of being of Dasein and the discipline of ontology helps to bring out this twofold location of ontology. We are (pre-)ontological in our being, and from the very beginning. However, it is only in so far as we move away from the (pre-)ontological origin that we are capable of developing the conceptual resources needed to make sense of this origin and to do so in terms of that discipline which is called ontology.

Moreover, it is also clear that, in some sense, this methodological circle has actually already manifested itself at least twice in the course of the history of modern philosophy; first, in the movement from rationalist and empiricist epistemology (based upon Aristotelian logic) through Kantian transcendental philosophy and so on to Hegelian ontology and then again in the move from positivist epistemology (based on a much more powerful symbolic logic) through Husserlian transcendental philosophy and so on to Heideggerian ontology.³⁸ That a certain reading of the history of modern philosophy confirms the logic of a transformation of epistemology into transcendental philosophy and transcendental philosophy onto ontology seems not only to offer support for this conception of the relation between the various methodologies in question, it also makes it possible to envisage the all-embracing methodology of 'interpretative transformation' as a *science*, in that time-honoured sense in which, for Hegel, the essence of scientific philosophy lies in its *systematic* character.³⁹

28 In the first instance the epistemological hierarchy is surmounted by formal thought in accordance with the 'highest principle of analytical judgment', see Macann, *Kant and the Foundations of Metaphysics*, p. 43.

29 Note the title of one of Piaget's earlier works: *La construction de la réalité chez l'enfant*.

30 As is well known, in his *Phenomenology*, Hegel takes as his clue to the stages set out in section A (consciousness) and B (self-consciousness), the Kantian faculty theory. From a starting point in the realm of sense, the exposition moves

through the secondary sphere of understanding before finishing up in the domain of self-consciousness. To be sure, the tautology $I = I$, in terms of which Kant formulates the reflectivity of apperception is, for Hegel, the mark of the inadequacy of this preliminary concept of self-consciousness. For all that, it is the highest faculty of apperception which Hegel has in mind with his concept of self-consciousness.

31 The first section of Part Three of The Kant book considers the 'three-fold division of the fundamental faculties' and finds grounds, in Kant, for the replacement of the provisional triptich (sense–imagination–understanding) by a more fundamental triptich (sense–imagination–apperception).

32 Although, strictly speaking, this third part should be divided into two, a part devoted to the phenomenologico-static and a part devoted to the ontologico-static presentation of the essential connection of the fundamental faculties, I have, for reasons of economy and in the light of a structure I call the 'ontological transposition', regrouped the two parts under the one head of an *ontologico-static* presentation.

33 The notion of a reduction is worked out in the section entitled 'Immanence'. As a result of the substitution of the concept of representation for that of appearance, the relation (of correspondence) to the object has to be determined by way of a structure of coherence.

34 Kant, *Critique of Pure Reason*, A xvii, p. 12.

35 The language Husserl uses in §131 is that of the 'determinable X'. In the synthesis of recognition in a concept Kant uses similar language to talk of a something in general = x (A 104) or the 'representation of the object = x ' (A 105). He will also talk of this transcendental object as a 'correlate of apperception' (A 250), which is presumably why it is also legitimate to talk of apperception as the 'transcendental subject of our thoughts = X' (A 346 = B 404).

36 Implicitly, though only implicitly, Fichte's *Wissenschaftslehre* (Hamburg: Felix Meiner, 1956) effects just such a re-interpretation of the faculty of apperception. Not only is the starting point of Fichte's philosophy the $I = I$, the efficacy of the I is defined as a practical activity (*stellen*) rather than a theoretical representation (*vorstellen*).

37 In the preface to the first edition of *Der Formalismus in der Ethik und die materiale Wertethik*, Scheler has this to say: 'I owe to the significant works of Edmund Husserl the methodological consciousness of the unity and sense of the phenomenological attitude.' *Formalism in Ethics and Non-Formal Ethics of Values*, tr. Manfred Frings and Roger Funk (Evanston: Northwestern University Press, 1973), p. xiv.

38 Part II of my overall ontological programme envisages an 'epochal interpretation' of the history of modern philosophy from Descartes on. The principle underlying such an 'epochal interpretation' is very simple, to find epochs corresponding to the several stages of the ontological genesis.

39 For example, in a passage from the preface to the *Phänomenologie des Geistes* Hegel writes: 'daß das Wissen nur als Wissenschaft oder als System wirklich ist und dargestellt werden kann'; G. W. F. Hegel, *Phänomenologie des Geistes* (Hamburg: Felix Meiner, 1952), S. 23.

The dialogue between Heidegger and Hegel

Denise Souche-Dagues

In 1950, in his Preface to the 2nd edition of *Kant and the Problem of Metaphysics*, Heidegger explained what he meant by a 'thinking dialogue' (*denkendes Gespräch*) between those who think (*zwischen Denkenden*), and recognizes that he has often been reproached for the violence (*der Vorwurf des Gewaltsamen*) of his interpretations. The laws, he explains, of such a dialogue are not those of 'philosophical history' nor of that kind of research characterized as 'history of philosophy'. What these laws might be Heidegger does not tell us but limits himself to affirming that they are 'more vulnerable' (*verletzlicher*): 'das Verfehlende ist in der Zwiesprache drohender, das Fehlende häufiger'.

Throughout his life, Heidegger pursued a 'thinking dialogue' with Hegel. From the time of his thesis on Duns Scotus, he saluted in Hegelianism 'the most powerfully systematic vision of the world, both in breadth as in depth, in living richness as in conceptual articulation', and, in *Zeit und Sein*, one of the latest of his writings, he saw in the speculative dialectic of Hegel, 'the most powerful thinking of the modern epoch [*gewaltigstes Denken*]'.¹

In addition to the texts which directly bear upon Hegel, Hegel is constantly present throughout his reading of Kant, of Nietzsche, of Heraclitus, of Hölderlin or of Schelling . . . and the reference to his thinking is always decisive.

Faced with the extent of the material which relates to Hegel in the Heideggerian corpus, I have decided here to concentrate upon the most important moments of the Heideggerian reading, and as follows:

- 1 The critique of the Hegelian theory of time in the Marburg lectures of 1925–6 and in paragraph 82 of *Sein und Zeit*.
- 2 The Commentary, dating from 1942–3, on the Introduction to the

Phenomenology of Spirit, to which has to be added the lecture of 1930–1, devoted to the beginning of the work.²

- 3 The lecture, given on 24 February 1957: 'Die ontotheologische Verfassung der Metaphysik' which follows the seminar devoted to the 'Wissenschaft der Logik' and to which a text from June 1957 on the Principle of Identity (*der Satz der Identität*) is attached.

These three moments can on the face of it be characterized in the following manner: the first, as a pure and simple refusal of the Hegelian problematic; the second, as an attempt, by Heidegger, to assimilate Hegel's thinking, or rather to render it assimilable to his own; the third, which is more complicated, consists in a setting at a distance which wants to be an appropriation. One may infer that, by 1957, the explicit relationship between Heidegger and Hegel had assumed its final form.

Heidegger's reading of paragraphs 257–9 of the *Encyclopedia*, devoted to time, and that of paragraph 254, devoted to space, as also that of those pages of the *Jena Philosophy of Nature* which deal with time, space and of their unity³ form the basis of the critical exposition of the Hegelian conception of time.⁴ The reproduction of his exposition will be very brief here;⁵ we shall be mostly concerned with determining what is at stake.

Heidegger underlines the fact that, in accordance with a tradition which goes back to Aristotle and which Hegel had recuperated, notably in Kant, the elucidation of time and that of space are for him bound up with one another; at times, for instance at Jena, he deals with time first and then space, at other times, for instance in the *Encyclopedia*, he follows the reverse order. But, Heidegger thinks, at bottom this difference changes nothing ('*sachlich . . . ist es dasselbe*'⁶). For what is in question here is time understood as belonging to nature. In the *Jena* version, the elucidation of time is inserted into the exposition of the 'System of the sun'; in the *Encyclopedia*, time is referred to 'Mechanics', the first section of the *Philosophy of Nature*. Here as there, the thinking about time is at the service of the understanding of the essence of movement and of matter. Thus the thinking is engaged in the project of a kind of knowing whose right to the title of philosophy is implicitly disputed by Heidegger. If the truth of space is time, according to a formula borrowed from a Zusatz to paragraph 257, this means, for Heidegger, that what has to be understood is the passage from one to the other. On the side of space, one finds the representation, which is nourished by fixed distinctions; on the side of time, it is 'absolute' thought which is at stake and in which no difference can subsist. The exposition in the *Encyclopedia* shows, according to Heidegger, that space is 'unmediated indifference' (*die vermittlungslose Gleichgültigkeit*), being-extrinsic to itself, the plurality of abstract points which can be distinguished within it. On the other hand, when the determination is thought and not simply

represented, this punctuality is 'surpassed', the point is no longer this one or that one. It no longer subsists in the calm juxtaposition of indifference. In other words, the negativity which was 'simple' negativity in space has become, as time, a negativity which stands in relation to itself, that is, a negation of negation. Heidegger comments upon paragraph 258 and its *Zusatz* as follows: 'die Bedingung der *Möglichkeit* des Sich-für-sich-setzens des Punktes ist das Jetzt.'⁷ This condition of the possibility is Being and Being is its thinkability (*Gedachtheit*) or, in other words, the truth of the matter. Such, in any case, is the meaning of the *is* in the formula: 'Space is time.'

In characterizing time on the basis of the now, Hegel, according to Heidegger, subscribes to the 'vulgar' understanding of time which contrasts with the existential analytic developed in *Sein und Zeit*. This vulgar understanding is the linear conception of time, a conception which reduces time to the external possibility of its measurability. Identified with the series of nows, it has become an oriented flux. What is the nature of this orientation? Heidegger replies: 'It is that which tends toward an annihilation of what is, which sinks into the no-longer of the past. Time is the consummation (*Verzehrung*) of what is. The future destroys the now-present and the latter is then swallowed up in the no-longer; a repetitive gesture which extends indistinctly throughout the entire series of nows. Hegel, Heidegger says, recognizes moreover that time is 'abstract'.⁸

This analysis is destined to render intelligible the link established by Hegel between time and Spirit, since the latter, according to Heidegger, 'falls' in time. An 'ontological' link but one which in Heidegger's eyes possesses a strictly formal character. Spirit and time are both thought as the 'negation of the negation' in a 'dialectico-formal' construction. Hegelian spirit, which Heidegger interprets as 'das sich Begreifen' is also the act of apprehending the not-self, and, as such, consists in the reduplication of a difference whose formula runs: '*cogito me cogitare rem*'. By borrowing a Cartesian and Fichtean terminology Heidegger is able to affirm that Hegel missed the concretion of Spirit and that he dangerously surpassed the Kantian lesson concerning the subjectivity of time in the supposed affinity of time and Spirit.

These Heideggerian glosses can only disappoint the reader of Hegel. Admittedly, Heidegger concedes that for certain of the texts cited here, notably the Jena *Philosophy of Nature* he did no more than run through it quickly.⁹ But the distance assumed by the commentary with regard to the texts is so great that one can only ask what exactly Heidegger has in mind with his polemic. Neither the texts from the *Encyclopedia* nor those from the Jena *Philosophy of Nature* rely upon the kind of 'transition' from representation to 'thought' which he finds there. For the *Encyclopedia* is plunged into the element of thought from the very outset

of the *Logic*. The *Philosophy of Nature* certainly does not constitute a slide back into representation, even if the Idea is taken there in its externality, or as intuited in and through its other. Furthermore, there is nothing like a progress from space to time to be found in either of these texts since, as Heidegger notes, the exposition of the Jena text also goes from time to space while the subject matter of thought (*die Sache des Denkens*) is the same there as in the *Encyclopedia*.¹⁰ Rather the contrary, to the extent that it is necessary to come to terms with the idea of movement, the elucidation of space and that of time complement one another in the sense that there is a reversal of the outcome of the dialectic of time (infinity assuming the form of self-equality) and the dialectic of space (self-equality becoming infinity). Even if the terms employed by Hegel in the *Encyclopedia* differ from those of the Jena text, it nevertheless remains the case that space and time both depend upon *being-outside itself* (*Aussersichsein*). But space exhibits a difference which is its own negation, and which, in developing itself and positing itself, becomes time. Space is the 'positive' unity of being-outside-itself. Time is its 'negative' unity. It is in virtue of its placement in the realm of the exterior that the latter is abstract, ideal and so cannot be identified with Spirit. It is nothing but the 'pure form of sensibility', the principle of abstract subjectivity whose formula is, for Hegel, the $I = I$ of Fichte. Furthermore, there is nothing like a 'fall' of Spirit into time, which would mean that Spirit descends from an eternity situated out of time. Eternity is for Hegel in its immanent totalization which is its true infinity. The present (*Gegenwart*) which is responsible for presenting this absolute unification indicates clearly that time is not in truth the indefinite and formal series of here-nows, cancelling themselves in the etc., etc., of indefiniteness.

The blindness of Heidegger towards the real meaning of Hegel's texts is echoed in the aggressivity of his style. In the lecture of 1925-6, he writes for example: 'Hegel kann alles sagen über jedes. Und es gibt Leute, die in einer solchen Konfusion einen Tiefsinn entdecken.'¹¹ At the beginning of paragraph 82 of *Sein und Zeit*, he affirms that he is not attempting to 'criticize' Hegel (*kritisieren*); but to the extent that the entire thrust of the text consists in attributing to Hegel the 'vulgar' interpretation of time which resists any existential analytic (as is indicated unambiguously by the title of the paragraph itself¹²), his intention is certainly that of overthrowing one (perhaps the most prestigious), of the philosophical theories of time in which he cannot find his own proposal. For the 'vulgar' time from which Heidegger withdraws is not retained in any way, even as suppressed, at the heart of the existential analytic. The treatment reserved for Kant at the end of paragraph 81 is much less abrupt;¹³ it is Hegel who is for Heidegger the theoretician of a 'levelled-down' time, of a time which originates in the now and which finds its

essence exclusively in the now. He is of course talking of 'vorhanden' time, a time possessing the characteristics needed to accommodate Spirit just as soon as the latter is, for its part, reduced to an abstract structure. At this point in his intellectual itinerary, Heidegger seems unable to find his own way save by turning away from Hegel. Even the apparent eulogy cited previously and formulated at the end of the book on Duns Scotus is not free from serious reservations. The terms which are now employed to characterize the Hegelian 'system' – 'world vision', 'historical vision of the world' become suspect from this period on with regard to the task Heidegger has assigned to thinking.

I propose to account for this refusal in two different ways, the first more historical and therefore more superficial, the second more internal and, for this reason, more risky, perhaps.

In the first instance I am indebted to the report made by O. Pöggeler of the lectures of 1925–6.¹⁴ O. Pöggeler points out that Heidegger came to Hegel not by way of neo-Kantianism (which might have led him to neo-Hegelianism) but rather by way of the teaching of the Catholic theologians of Tübingen for whom a decided opposition to Hegel's Lutheranism was an essential pre-requisite. In his view, Heidegger is particularly suspicious of the Hegelian conception of history (and therefore of time), the dialectic for him being incapable of thinking life and the contingencies of experience. One might add, without either leaving the plane or the tenor of O. Pöggeler's analyses, that Hegelianism is challenged in the same Catholic circles on account of Hegel's affiliation with the Enlightenment.

In this way one can put one's finger upon circumstances surrounding the Heideggerian reading of Hegel which are certainly not to be overlooked. But one is entitled to doubt whether what is philosophically at stake in this reading is adequately broached in such a reading.

The critical issue seems to us to be brought to light by way of Heidegger's evocation of the tradition to which the 'vulgar' conception of time belongs. The latter is marked out by Aristotle, then by Kant and Bergson, the latter arguing that time 'is' space (the reverse of Hegel). If one bears in mind that in 1928 Heidegger edited the *Lessons* professed by E. Husserl in 1905, opening the way to a phenomenology of inner-time consciousness, a task assigned to him some years previously in succession to E. Stein, one may be surprised to find that Husserl's name is not even mentioned here. It seems to me that this silence has to be interpreted. In Husserl, Heidegger finds a conception of time which is fundamentally at odds with his own. Engaged in representation, it furnishes a formulation of the experience of time understood as indefinite, starting out from a 'here and now' which is always suppressed and yet which is always renewed in the etc. . . . of a homogeneous series. The description of an 'inner' consciousness of time is moreover constantly recovered in Husserl

through the bringing to light of its objectifying function, 'longitudinal' intentionality functioning at the behest of 'transversal' intentionality, that is, of transcendence. In addition, he is convinced that these Husserlian descriptions contribute more to the consciousness of the past, on the basis of retention, than they do to that of the future, treated as the symmetrical equivalent of the past. In this way one can quite easily disentangle in Husserl's text the most important elements of the critique addressed by Heidegger against Hegel's concept of time. It is also noteworthy that the text of the Foreword written by him for his edition of the Husserlian *Lessons* is not only very brief but also, and more especially, that he insists on their importance from the standpoint of an elucidation of intentionality, that is, of representative thinking. This very fact puts these analyses at a great distance from the kind of temporality which the existential analytic has in mind.¹⁵ Does this mean that 'Hegel' is a pseudonym, the young Heidegger having withdrawn from an explicit critique of the master of Freiburg (to which *Sein und Zeit* is dedicated) as before a sort of philosophical parricide? It will suffice to suggest here that the general critique of representation came to cover for Heidegger from 1925 on his debate with any thinker whatsoever and that the reading of a philosophy, especially if it can in addition be considered 'rationalist', is dominated by a purely negative and critical ambition.

In 1930-1 one finds, in the lecture devoted to the beginning of the *Phenomenology of Spirit* (the chapter 'Consciousness and self-consciousness'), a resumption of the critique of Hegelian time,¹⁶ identical in spirit with that of the years 1925-7 but more definitely oriented in an ontological direction. Heidegger presents the problematic of *Sein und Zeit* as the exact contrary (*das gerade Gegenteil*) of what Hegel attempted to establish concerning time throughout his philosophy. Heidegger contrasts his 'das Wesen des Seins ist die Zeit' explicitly with Hegel's 'das Sein ist das Wesen des Zeit', *Sein* being of course, in this Hegelian context, the formula for abstract Being, *vorhanden*. Even if Hegel calls time 'infinite', its assimilation to space is, according to Heidegger, the basis upon which Hegel is able to uphold the identification of Being with the essence of time. Henceforward, the entire weight of the Heideggerian reading is going to bear upon the meaning of the Hegelian ontology.

In 1942-3, Heidegger gave a number of seminars on the *Phenomenology of Spirit* and on Aristotle's *Metaphysics* (Books IV and X). A text entitled *Hegel's Concept of Experience* published in *Holzwege* in 1950 and reprinted in volume 5 of the *Gesamtausgabe* resulted from these seminars. Employing a deliberately didactic style, Heidegger pursues the text of the Introduction line by line in a dense commentary about five times as long as the Hegelian text.

What is at work here is an enveloping of Hegel's thought designed to render it consistent with that of Heidegger whose key words (*Sein-*

Seiendes) are imposed upon the Hegelian text in such a way as to determine its meaning.

Since, according to Heidegger, the *Phenomenology of Spirit* in its entirety points towards self-consciousness, he situates the latter with reference to consciousness as a 'presentation' distinct from a 'representation'. 'Das Vorstellen präsentiert das Objekt, indem es dieses dem Subjekt repräsentiert. Die Präsentation ist der Grundzug des Wissens im Sinne des Selbstbewusstseins des Subjekts.'¹⁷ Here we find once again the same Cartesian-Fichtean interpretation of consciousness as in the text of *Sein und Zeit*, and the same insistence upon a reflective reversal of consciousness into self-consciousness, this latter featuring as the essence of Spirit.¹⁸

Since Hegel employs the word *Darstellung*¹⁹ to designate the central task of the *Phenomenology of Spirit*, Heidegger superimposes *Präsentation* and *Darstellung* one upon the other and writes: 'Darum ist die Darstellung, die dieses Seiende als das Seiende vorstellt, die Philosophie, selbst die Wissenschaft.'²⁰ The being in question here is subjectivity understood as absolute certainty of self. 'Presentation' is therefore nothing other than 'absolute knowledge',²¹ since the certainty of self-consciousness results from the ab-solution, in it and through it, of all relativity attaching to intentional representation.

The result is that if one considers the 'presentation of appearing knowledge', that is phenomenology, as a journey undertaken by consciousness in the direction of a goal which would be its other and which would initially be concealed from it, we have to do here with an appearance which, according to Heidegger, is cleared up in the very first paragraph of the Introduction.

At this point it would be appropriate to take the measure of the work accomplished by Heidegger on Hegel's text. It is well known that this text begins with a dismissal of the critical procedures which call in question the fallibility of knowledge on the basis of the fallibility of its instruments. Hegel challenges steps such as these, steps which, supposedly inspired by the fear of error, attest more readily to a certain fear of truth. Heidegger's proposal consists therefore in bringing to light Hegel's confidence in the presence of the absolute 'close by us',²² a confidence which is expressed in the detour accomplished by a subordinate proposition. So one sees him annexing to this end the ironic phrase by means of which Hegel condemns the efforts of those who think that the instrument of knowledge would be able to bring the Absolute close to us without changing anything in it (*an ihm*): 'wie etwa durch die Limrute der Vogel, so wurde es wohl, *wenn es nicht an und für sich schon bei uns wäre und sein wollte*, dieser List spotten',²³ thereby making it the pivotal point of his whole reading of the Introduction since,

according to him, 'in der Vollendung des Werkes ist der Nebensatz zum einzigen Hauptsatz geworden'.²⁴

What might be called the monolithic character of Heidegger's commentary follows from the above. In fact, once *Darstellung*, presentation, has been identified with absolute knowledge, its movement, the dynamic of presentifying representation 'sets out from the appearing consciousness as such, that is, from real knowledge which is the truth of natural knowledge'.²⁵ Henceforward, the presentation in question is certainly, if you like, a path, but not a reach (*Strecke*) which is supposed to stretch from pre-philosophical representation to philosophy. When Hegel says that presentation is a presentation of appearing knowledge,²⁶ Heidegger tries to understand the 'appearing' character of knowledge on the basis of what Hegel says about the phenomenal character of science, that is of philosophy: to wit, that when it enters on the scene it is in itself a phenomenon since it has to be juxtaposed to another knowledge which could be regarded as its phenomenon in a weak sense of that world, that is, a little like its shadow. To accomplish this he makes use of a gloss of *Erscheinung* which he had already offered in his *Introduction to Metaphysics*. While *Erscheinung* is credited, in paragraph 7 of *Sein und Zeit*, with an ambiguous meaning (in that it announces what is most often hidden and in that it can always lapse into an illusory appearance (*Schein*), *Phänomen* being, on the contrary, the showing-itself-from-itself, in the *Introduction to Metaphysics*, the appearing (*Œscheinen-Erscheinen*) is understood as *lighting*, as *presenting itself* and, in the end, as *Being*: 'Sein west als Erscheinen.'²⁷ Such is the non-latency of ἀλήθεια. Thus, by means of the substitution of one text for another, of *Erscheinen* (*Erscheinung*) for *Phänomen*, we find an affirmation of both the unity and the antipathy (with unity taking the lead) of Being and Appearing (*Sein-Schein*).²⁸ When he wrote the commentary to the *Introduction to the Phenomenology of Spirit*, Heidegger reinforced the strength of this unity, *Erscheinen* having definitively gathered within itself the positive aspect initially accorded to *Phänomen*. This is why knowledge, in its appearing, can be called 'real knowledge' or, 'the truth of natural knowledge'.²⁹

In this way Heidegger seeks to discredit an interpretation of the *Phenomenology of Spirit* which treats this work as a sort of *Bildungsroman*, an initiatory journey which sets out from knowledge or from a consciousness entitled 'natural' and which ends up with Absolute Knowledge. This interpretation is dismantled by him with the aid of semantic shifts from *Erscheinung* to *Sein*, the first understood as revelation and finally as the absolute of manifestation. If the *Phenomenology of Spirit* is the presentation of Knowledge and if this presentation is the Knowledge itself, it certainly involves a journey, but a journey which does not finish up anywhere but the place where presentation is itself unfolded.

This is how he establishes the belonging together of representation (which is the work of consciousness in as much as its essence is intentionality) and presentation – the work of self-consciousness which is the ab-solution of objectification: an interiorization (*Er-innerung*) and an appropriation (*Zu-eignung*).

If therefore, in a phenomenology, the presentation of the appearing is not to be distinguished from the Being of what appears (since Hegel has given the name *Spirit* to this very Being), the *Phenomenology of Spirit* has to be understood as a subjective genitive. The theme is Spirit in its appearing, that is, in its self-unfolding. And the consciousness (entitled natural) through which this presentation is inaugurated is always already the absolute consciousness which is presented through this very presentation. This is what gives the work the structure of a ring (*Ring*).³⁰ It is his refusal to consider the *Phenomenology of Spirit* as describing a pathway-towards which explains Heidegger's refusal to consider the Introduction to the work as a true introduction, separable from the main body of the work. The sixteen paragraphs of which it consists make up for him an integral part of the work.

What might be called the 'monolithic' character of the Heideggerian reading breaks out in his commentary on paragraph 6, where he effects a reciprocal reversal of the two figures distinguished by Hegel: natural consciousness, on the one hand, and real knowledge, on the other. Heidegger supposes that the two nominations are employed in the same way (*für das Selbe*).³¹ To show this, he analyses *Bewußtsein* out into: *bewußt* (alias *wissen*) and *sein*. The first term, knowledge, is a seeing, or rather a having-seen. It holds together the known and the knowing. 'Sehen wird hier als Vor-sich-haben im Vorstellen gedacht.' The *Sein*, according to him, insists upon presence (*Anwesen*) in the guise of a gathering together of what is in view.³² But the subject is caught up with what confronts him. Subjectivity is what accompanies all consciousness in general. It is presence (*Präsenz*) in the mode of representation (*Re-präsentation*). Consciousness being, as such, the appearing, one sees that the omni-presence of presentation (*Darstellung*) blocks, so to speak, appearing knowledge, both ontologically and methodologically. The 'presentation of appearing knowledge' which Hegel assigns to the *Phenomenology of Spirit* is only the presentation of appearing knowledge in its appearing.³³ Such is the bi-polarity of consciousness, engaged on the one hand in its relation to the object, and, on the other, oriented towards its concept, that is, in the words of paragraph 82 of *Sein und Zeit*, towards the re-apprehension of its apprehension of the object. Heidegger writes: 'Hegel gebraucht die Unterscheidung von natürlich und real in Bezug auf das Wissen oder das Bewußtsein, das in sich das Erscheinende ist.'³⁴ Natural consciousness, constantly attached to beings, only succeeds in explaining one by way of others and this in the sense

in which its knowledge is 'natural'. But 'real' knowledge, knowledge of what being truly is, is not the complement of natural consciousness. To be sure, Hegel does oppose them, but they are intimately linked with each other since natural consciousness is the 'concept' of real knowledge.³⁵ It is in this way that Heidegger accounts for their connection: '(das natürliche Bewußtsein) kann nicht umhin, das Sein des Seienden im allgemeinen mitvorstellen, weil es ohne das Licht des Seins sich an das Seiende nicht einmal verlieren könnte.'³⁶

So the interpretation finishes up with the ontological difference. The latter can alone make it possible to think the opposition designated by Hegel, and it does so by referring this opposition to that belonging together which inseparably joins Being and beings. If natural consciousness is *only* the concept of real knowledge, it is so because the representative capacity which is its essence does not properly apprehend what is represented. It turns away from it, that is, it turns away from the light in which its representative capacity is fulfilled to consider only the being with which it is, in each instance, concerned. Historically, Heidegger sees lurking behind Hegel's 'natural consciousness' the entire metaphysics of the nineteenth and twentieth centuries, a metaphysics which is anticipated in the Hegelian text under the name of a 'doxic system'.³⁷ If, on the other hand, the appearing of appearing knowledge (i.e., natural consciousness) is installed in the light which belongs to it then real knowledge (the 'ontological' in its opposition to the 'ontic') is revealed as *the same* as natural consciousness and its opinions but not, for all that, as being its 'equivalent'.³⁸

This is the decisive moment in Heidegger's appropriative reading. One can see that the whole effort of this reading aims at assimilating the Hegelian thesis with regard to the Absolute to the ontological difference as it functions in the thinking of Heidegger. In this way, Hegel is in a certain sense freed by Heidegger from that yoke which is 'metaphysics' in the eyes of the latter. But, by the same token, he is also subjected to it. With a view to opening up the way to a description of this paradoxical description of the locus of Hegelianism, I shall examine Heidegger's treatment of the Hegelian themes of doubt and scepticism.

When Hegel says that the path followed by natural consciousness towards its truth is that of doubt and even of despair,³⁹ Heidegger takes this as an opportunity to appeal to Descartes who had already been evoked when the real (i.e., the true) had been designated as 'the certain'.⁴⁰ But doubt contains a new reason for recalling Descartes, whose *Metaphysical Meditations* show that the path of doubt is pursued at the heart of a certainty which assumes the role of *fundamentum absolutum*.⁴¹ In other words: the absoluteness of this absolute is with Descartes, according to Heidegger, neither doubted, nor questioned nor even referred to in its proper essence. And the same is the case for him with

the course of Hegel's thinking, as we have seen. But the latter has the advantage over Cartesianism that it is enlightened by the knowledge that it has to *begin with* absoluteness – the very thing Heidegger read into the famous subordinate clause from the first paragraph. Contrary to Descartes, who only sketched out the country (*Land*) of modern philosophy, Hegel situates natural consciousness in its proper countryside (*Landschaft*), that of the representation of beings.⁴² Natural consciousness not being able to turn back towards its truth (since it is preceded by the latter) is therefore condemned to lose, one after the other, the evidence upon which it is based, and this is the ineluctable fate of presentation, that is, of absolute knowledge.⁴³ 'Je vollständiger die Darstellung den Weg der Verzweiflung durchgeht, um so eher vollendet die Wissenschaft ihr eigenes Erscheinen.'⁴⁴

Henceforward that scepticism whose exclusive right to pave the way for science Hegel will challenge in the *Encyclopedia* (cf. paras 78–81) but which, in the Introduction to the *Phenomenology of Spirit* benefits from a positive appreciation on condition that it is extended to cover the entire domain of appearing consciousness, is thought by Heidegger as a function of its Greek root: σκέψις, and referred by him to *seeing*, to seeing the Being of beings: 'ihr Zusehen [sc. der Skepsis] hat im vorhinein das Sein des Seienden gesehen.'⁴⁵ In as much as it is an already having seen, seeing is a knowing. In the course of this working out of knowledge there is certainly for natural consciousness a movement from one figure to another. But this movement designates the unity which it is in itself, namely, the unity of natural knowledge and of 'real' knowledge. In this way, scepticism turns out to be nothing other than the historicity of history.

But if in general, for Hegel, *Being* means a reality which is still untrue, that is, which still exists for a subjectivity which has not yet come to itself,⁴⁶ *being* cannot be employed to characterize the essence of spirit, self-consciousness (*Selbstbewußt sein*).⁴⁷ Consequently, without his even knowing it, and certainly not by virtue of some circumstance or contingent oversight, the Hegelian text reflects the secret game by means of which Being discloses itself and closes itself off. This game governs and dominates metaphysics in its entirety *but as its unthought*.

In this way Heidegger furnishes himself with the means of understanding what Hegel calls the 'contradiction' of consciousness: to wit, the fact that it is, in its entirety, a knowledge of something and an examination of this knowledge without, for all that, standing in need of going beyond itself to examine this practice.⁴⁸ This is because, according to Heidegger, consciousness is a difference which is not really such, for the two determinations of knowledge (that it is *for itself* and that, as true, it is also *in itself*) emerge here in their immediate ambiguity,⁴⁹ an ambiguity which defines the Being of consciousness. The appearing knowledge of what

appears has always already acceded to the true light of Being because it has already been installed therein. But the difference which inhabits consciousness is 'levelled down' by Hegel in that he does not permit it to be deployed as the difference of Being and of beings. This 'levelling down' consists in its being called 'negation of the negation',⁵⁰ and that in this way it possesses a purely 'logical' meaning, a meaning of such a kind that it can be recovered in what Hegel calls 'experience' but also *Erscheinen*, since it is a structure which is identical through and through. This is why when Hegel designates as 'experience' the dialectical movement which consciousness effects upon itself (*an ihm selbst*),⁵¹ this 'experience' is valid of the apprehension of beings, singly and individually. But what appears in appearing knowledge, that is, the reciprocal movement of natural consciousness and of real knowledge, is Being thought from the standpoint of its beingness: ὅν ἢ ὅν. If experience is this movement, the dialectic by means of which it is defined by Hegel is thought by him out of the essence of experience, which means: out of the essence of consciousness. 'Diese [i.e., die Erfahrung] ist die Seiendheit des Seienden, das als subjectum sich aus der Subjektivität bestimmt.'⁵²

Eliminating from the Hegelian clarification of the 'dialectic' the triplicity thesis/antithesis/synthesis as well as the 'negation of the negation', Heidegger would like to think into it a movement which is consciousness, or in other words, a comparison which is operated by consciousness between an ontic-pre-ontological knowledge and an ontological knowledge.⁵³ But since this dialogue (*Gespräch*) moves across all the figures of consciousness it draws them together and draws itself together in them. The διαλέγειν is a διαλέγεσθαι by means of which the drawing together which Heidegger assigns to λέγειν is itself recovered. In this way, by disclosing within the Hegelian text and in order to illuminate it, this structure of an ontological difference and of its history as λόγος, Heidegger wants us to note that the progression of meaning which constitutes his own method remains unthought by Hegel. At the same time, by eliminating any genuine opposition from *Gespräch* and from διαλέγειν and so a fortiori avoiding all contradiction (in accordance with the generally professed unity of natural consciousness and real knowledge in the enclosing presence of the Absolute), Heidegger is able to refer the dialectic to Being, now understood as the beingness of beings operative exclusively as *Anwesen*.

In fact, that presentation of appearing knowledge which is phenomenology now finds its limit in presence. Heidegger prefers to write presence in Greek: παρουσία, often transposed into *Parousia* (there are forty-four instances of this usage in the text). It is in the light of the latter that beings are exposed to presence. It is in the light of presence that subjectivity is 'at home' with itself.⁵⁴

Weil die Phänomenologie die Erfahrung ist, die Seiendheit des Seienden, deshalb ist sie die Versammlung des Sicherscheinens auf das Erscheinen aus dem Scheinen des Absoluten. . . . 'Die Phänomenologie' ist selbst das Sein, nach dessen Weise das Absolute an und für sich bei uns ist.

These conclusive affirmations from the Commentary have to be read in a perspective prepared by the word *Parousia*, which comes to us out of Christology. Heidegger evokes here the 'dialectico-speculative Saint Friday', thereby echoing the last lines of *Glauben und Wissen*.⁵⁵ In this way he feels himself justified in characterizing the science of the *Phenomenology of Spirit* as a theology of the Absolute, more exactly, as a theology of the death of God, the Science of Logic constituting for its part the theology of the absoluteness of the Absolute before the creation.⁵⁶ Both of these (the *Phenomenology of Spirit* and the *Logic*) are ontologies, which means that they think the mundanity of the *world* in as much as *world* designates being in its totality, which kind of being is founded in subjectivity. This mixture of ontology and of theology, a mixture in which the *Phenomenology of Spirit* is itself situated, begins to be thought metaphysically by Hegel on the basis of the will, a theme Heidegger accentuates repeatedly by relying on the formula of the third paragraph in which Hegel writes that Science wants to know the Absolute (there are twenty-nine uses of *willen* and its derivatives in this text by Heidegger).

Has Heidegger brought forth the truth of the Introduction to the *Phenomenology of Spirit* and thereby brought forth the truth of the entire work, or has he not rather simply covered it over with glosses borrowed from his own way of thinking? Posed in this way, the question might appear rather uninteresting, more particularly if one believes with him that

the language of a thinking which has grown up out of destinal roots invokes the thinking of another thinking in the clarity of its thinking, simply in order to refer the other to its own proper essence [die aus ihrem Geschick gewachsene Sprache des Denkens ruft . . . das Gedachte eines anderen Denkens in die Halle ihres Denkens, um das andere in sein eigenes Wesen frei zu geben].⁵⁷

The (deliberate?) ambiguity of *frei-geben* which is the concession of liberty, but which ordinarily means relinquishing, is full of meaning. At one and the same time Heidegger both invokes Hegelian thinking in the light of its own language, which latter was formed in accordance with its own specific destiny, and leaves this thinking to its destiny, thereby holding it at a distance from himself. The treatment he metes out to the

Hegelian text here is therefore very different from the one which, earlier, found expression in paragraph 82 of *Sein und Zeit*. What has been called the 'envelopment' of the Hegelian thinking finishes up granting to it, deliberately and explicitly and through a kind of mimetic effect, the language of destinal thinking, that is, for Heidegger, the language of that very thinking which seeks to measure the gap that opens up between these two thinkers. For this reason one is entitled to hope that, avoiding a paraphrase of Hegel in his own language, the Heideggerian commentary is able to situate the phenomenological enterprise in a realm beyond conclusive exactitude and so in a light which brings out its truth.

The decisive feature of the Heideggerian reading is clearly his affirmation of the 'presence' of the absolute, of his 'will' to establish it 'close to us'. According to Heidegger, the absolute is, with Hegel, consciousness of self, a knowledge which returns to itself rather than losing itself in its other, a knowledge which is adjusted to Being, understood as the beingness of being, therefore as subjectivity.

One only has to re-read the celebrated last lines of the Introduction to recognize the well-foundedness of this point of view. One knows that all the figures of consciousness are, so to speak, anticipated in 'the point where [consciousness] abandons its illusion of being affected by something alien which is only for it but which is something other than it', the point where 'the phenomenon measures up to the essence'.⁵⁸ What Heidegger calls an ab-solution of intentional and representative consciousness is certainly what is at issue there. But since this point is only 'attained' to the extent that consciousness drives itself (*sich forttreibt*) continually forward towards its true existence, one can ask whether Hegel would in fact have multiplied the metaphors of journeying and of labouring with oneself if this point were, as Heidegger claims, the point of departure for a science of the experience of consciousness. In this respect it is highly significant that when Heidegger invokes the text which has just been cited,⁵⁹ he empties the verb *sich forttreiben* of its reflective character and gives it as its subject 'the power of the absolute': 'die in der Erfahrung waltende Gewalt des Absoluten "treibt das Bewußtsein zu seiner wahren Existenz fort".' The apparent literalness of this quote masks a real perversion of its meaning. A passage from the Introduction confirms this explicitly. To make the point that consciousness, as opposed to natural being, is ceaselessly carried beyond its immediate being-there, Hegel writes: 'das Bewußtsein leidet . . . diese Gewalt, sich die beschränkte Befriedigung zu verderben, von ihm selbst.'⁶⁰ If, moreover, one accepted the Heideggerian reading (the transgression of consciousness beyond its limits coming from the Absolute which is close to it, as self-consciousness) it would imply that the second part of the work at least is superfluous, since the *Phenomenology of Spirit* would thereby become a history which was not one in fact, with Hegel invoking a

journey, even an adventure when, in reality, everything has already been consummated.

As for the harmony between self-consciousness and *being*, it is clearly underlined in the *Phenomenology of Spirit*, but it only makes its appearance in the chapter on 'Reason', where Hegel seeks to distinguish himself from any Kantianism for which the consciousness of self and Being stand in a relation of 'simple' unity.⁶¹ The chapter in question is intended precisely to demonstrate the ontological inadequacy of subjective idealism (Kantian and Fichtean) which defines the true by means of an abstract concept of reason. The latter is for Hegel directed towards the truth of its initial certainty (the certainty of being on a par with Being) and raises itself up to the level of Spirit 'by giving content to the empty mine'.⁶² In this way, avoidance of representation assumes, in the *Phenomenology of Spirit*, a very different form from any theoretical reflection of the Fichtean kind, for Hegelian reflection is reflection of, and in, the object just as well as being a reflection of the subject; and this is the sense in which it is called 'absolute'.

This is the reason why the disappearance of the object initially in view can engender a new object which is its *determinate negation*. Far from possessing the formal structure of the negation of the negation, Hegelian negativity makes it possible to think history as the effort undertaken by consciousness to obtain access to its true existence, which is no longer that of a solitary consciousness but of a purely theoretical consciousness.

If one concentrates on the presence of the Absolute, its very nomination as *parousia* tends to align it with a non-temporal, liturgical presence, and on the basis of a frontal (*vor-liegen*) expansion. No longer reproaching Hegel with having privileged the past, among the dimensions of time, as he did in paragraph 82 of *Sein und Zeit*, but, in virtue of his attachment to metaphysics, with having identified Being and presence, Heidegger finds himself in a position to point out a relatively uncontroversial aspect of Hegel's systematization, namely its circularity. But, according to him, the latter introduces an element of a-temporality into the thinking of Hegel (that of having-always-already-seen) which would be the condition of the possibility of history, now called 'historicity'. Here we undoubtedly find a decision to read and interpret Hegelianism which is not entirely peculiar to Heidegger.⁶³ But with him it nevertheless takes on a quite special emphasis through the importance placed upon the structural duality of representation and of presentation or of consciousness *vis-à-vis* self-consciousness to which, in his view, the entirely phenomenological discourse would be reduced in a purely schematic fashion.

In fact the latter, as the 'presentation of appearing knowledge' is limited to pointing towards (*bezeichnen*)⁶⁴ the nature of absolute Knowledge. Hegel refuses the confusion of that 'becoming of Science in general'

which is presented in the *Phenomenology of Spirit* with 'the enthusiasm which begins immediately with absolute Knowledge, as with a starting pistol'.⁶⁵ Moreover, the *Phenomenology of Spirit* is not foundational with regard to the Science; it simply demonstrates the necessity of the 'point' at which the concept is identified with the object. By virtue of the fact that it shows the way that consciousness has to take to accomplish its liberation it becomes entitled to announce the Science of the Absolute.

When Heidegger interprets the famous footnote to the first paragraph as the affirmation of a presence of the Absolute which was always already there, he takes away from it its speculative character which, with Hegel, implies the refusal of any assimilation of knowledge to a trick, that is, to any subjective manoeuvre opposed to what it knows and which is always to be distinguished from the latter. Understood in this fashion, a knowledge of the Absolute would certainly be impossible, for it would represent an imposition which would make the Absolute fall into the realm of the relative. So, in this context, what is at issue is not the presence or the non-presence of the Absolute by which we are surrounded but a reversal of a gnosticism which stems from Kant. As soon as knowing is no longer subjected to the illusion of its alienation from its object, it is the Absolute itself manifesting itself in and through the relativity of the appearing, rather than being separated from it. To this extent, one might be tempted, as was Heidegger, to identify the presentation of appearing knowledge with absolute Knowledge.⁶⁶ But in fact, if the Absolute is what phenomenizes itself, or if the phenomenon itself becomes the Absolute, that of itself indicates that the Absolute does not 'surround us', that it is not 'present'. It is not present in the mode of worldly presence, nor even in the mode of a mystical presence to the fervent soul. It is because it is informed by the truth, which is identical with freedom, therefore by its own self-formation (*Selbstbildung*), that consciousness 'tends' towards the Absolute just as soon as the doubt and despair by which it is assailed in the course of its experience are not considered as the abstract echo of a metaphysical tradition. This means that the finitude and the relativity of consciousness is brought to an end of its own accord. This is the sense in which consciousness brings with it its own yardstick, its own 'concept'. In this way Hegel breaks with the metaphysical theory of the Absolute in accordance with which the infinite is exterior to the finite even if it remains in close proximity to it. For him, if it is true that all determination is a negation, this negation is also the origin of determination. As for the ontological difference, it should be said that Science attests to its continual resolution, not in the fixed and unilateral form of a belonging-together but in the admitted *contradiction* of concealing and revealing.

In the final analysis, the relegation of Hegelianism to onto-theology goes back much further than the Commentary of 1942-3 since it is

already to be found in the lectures of 1930–1.⁶⁷ We shall consider it here in the light of the lecture of 1957 where the strategy of assimilating Hegel and setting Hegel at a distance is confirmed and becomes yet more acute.

‘Die ontotheologische Verfassung der Metaphysik’ is not limited, as are the writings cited earlier, to the elucidation of a specific text of Hegel; Heidegger talks here of Hegelianism on the basis of its directing principle and wants to arrive at a decision about its status within the totality of the thinking through a meditation upon its ‘historical’ destiny at the heart of metaphysics. With a view to accomplishing this, he begins by situating it in the tradition of transcendentalism, a point of view frequently expressed by him. Hegel would like to think the transcendental ‘absolutely’, and Heidegger names this Hegelian absolute *der Gedanke*, a formula which is equivalent for him to the absolute Idea which figures at the end of the *Wissenschaft der Logik*.⁶⁸ He underlines the fact that Hegel, having arrived at the conclusion of this Science (the name of Science, since Fichte, being that of philosophy itself) identifies the absolute Idea with Being, that is, with that which designates the Subject Matter, or the Concern of Western thinking in its entirety. At this terminal point, the thinking-itself absolutely of thinking is the truth of that Being which was presented at first as indeterminate immediacy, then as absolute reflection, that is, as Essence. ‘Die Sache des Denkens ist für Hegel das Sein als das sich selbst denkende Denken, welches Denken erst im Prozess seiner spekulativen Entwicklung zu sich selbst kommt.’⁶⁹ Such is the mark of a ‘historical’ (*geschichtlich*) thinking.⁷⁰

It is this disposition of Hegelian thinking which makes it be that the beginning and the end of the Science are the ‘same’, that is, Being, considered first in its emptiness and, at the end of its development, as its own fullness. ‘Anfang und Ende der Bewegung . . . bleibt überall das Sein. Es west als die in sich kreisende Bewegung von der Fülle in die äusserste Entäusserung und von dieser in die sich vollendende Fülle.’⁷¹ This circular journey by way of Being, of that totality of what is which makes it present at the beginning and at the end of its movement is elucidated by Heidegger both as *totality* and as *ground*. ‘Die Ganzheit dieses Ganzen ist die Einheit des Seienden, die als der hervorbringende Grund einigt.’⁷²

Let us look first at its unitary and total character. Heidegger asks: why does Hegel call what is in truth a Treatise on Metaphysics a *Logic*? It is because, he answers, the original meaning of *Logos* is the gathering of what is there, but at the expense of this originality in the sense of Discourse in that it becomes *Ratio* in its latinate transposition. Hegel is the inheritor of this degradation initiated by the first Church Fathers. When the *Logos* was identified with Christ that thinking which attempts to break out in certain decisive passages of Heraclitus is betrayed.⁷³

Calling a book which deals with Being in its totality and with the entire movement which leads to its developed fullness a *Logic* must therefore be regarded as one of the major ambiguities of the metaphysical tradition to which Hegel himself owes allegiance. In such a *Logos*, the Heraclitian meaning of the totality of what is can only be guessed at.

The second thread woven into the metaphysical thinking of *Sein* arises from the first. Heidegger always underlined the close connection between the theme of foundation and that of the *Logos*, understood as *Ratio*, as one of, if not the, decisive feature of the metaphysics of Leibniz and Schopenhauer right up to the contemporary epoch dominated by technology.⁷⁴ By translating *Grund* into his own language, his proposal is here to bring to light the derivatives of its original meaning. The latter splits into two: Heidegger distinguishes the (*der*) 'ergründende' (or simply 'gründende') and (*der*) 'begründende' *Grund*.⁷⁵ This distinction for which it is difficult to find an equivalent in other languages is operative,⁷⁶ and to some extent runs parallel with that between *Überkomnis* (valid both for *gründen* and *ergründen*) – Being founding beings – and *Ankunft* (*begründen*), one being taken to be the supreme being and so founding the Being of beings. Being and beings are therefore to be found in a relation of reflection (*Widerschein*) or mutually referring and reciprocal appearance. They form a circle. The circulation of one around the other, of one to the other, is called by Heidegger *Umeinanderkreisen*. If the supreme being is regarded as founding the totality of beings, it then receives the name of God, and philosophy becomes a non-ecclesiastical theology. This is what Heidegger imputes to Hegel, no doubt recalling the famous text from the Introduction to the *Science of Logic* cited earlier,⁷⁷ but also citing in this instance the passage in which Hegel evokes the possibility of making of God the beginning of the *Science*.⁷⁸

These different glosses have prepared the way for the *Science of Logic* as 'onto-theology'. The suffix *-logy*, common to the most varied bodies of knowledge, indicates that it is a matter of a 'science' in accordance with the conventional meaning of the *Logos* (as, according to Heidegger, are those other bodies of knowledge which deal with the living, the cosmos, or antiquity). 'Die -Logia ist jeweils das Ganze eines Begründungszusammenhangs, worin die Gegenstände der Wissenschaften im Hinblick auf ihren Grund vorgestellt, d.h. begriffen werden.'⁷⁹ By virtue of the identification of *Logos* and of *Sein*, this science is an ontology, *Logos* holding for the gathering of the whole of being. Hegelian Being certainly has this totalizing function. Its realization does indeed meet all the requirements of the different bodies of knowledge. In the end therefore it is an onto-*theo*-logy since Being as the *Logos*, understood as the ground, is granted the title of God in the Judaeo-Christian tradition where the creator, as the Author of the world in totality, is the One who lets the world unfold (*vor-liegen*) before him.

But in connecting Hegelianism with metaphysics in this way Heidegger detaches himself at the same time from the latter through the 'step back' (*Schritt zurück*) which allows him to take account of the sameness (*Selbigkeit*), though certainly not the similarity (*Gleichheit*), that the Matter of Thinking has for Hegel and for himself, that is, for metaphysics and for himself. In this way he hopes to bring Hegelianism, as fulfilling (*vollendend*) the destiny of metaphysics, closer to his own thinking, which wants to 'overcome' (*Überwinden*) metaphysics. This means that the diversity (*Verscheidenheit*) of the two kinds of thinking demands that they should each of them be thought in a quite determinate fashion, or again that the 'thinking dialogue', carried out in the element of sameness, should also be a setting at a distance, as if the metaphysics and the step back through which Heidegger gains access to the un-thought of this metaphysics were one and the same.⁸⁰

The ontological difference both sums up and presents this situation. We have already taken note of the way in which the relation of Being to beings intersects in a manner which unites them within the field of metaphysics. If this is the case it is because the difference is that which thinking opens up to, or else that from which it withdraws itself in self-forgetfulness. Metaphysics establishes its reign in the forgetfulness of the Difference, thinking in its commemoration (*Andenken*), *but this only in so far as the forgetfulness and the commemoration, the retreat and the openness, are regarded as belonging to the same characteristic of Being.* 'Die Vergessenheit gehört zur Differenz, weil diese jener zugehört.'⁸¹ The reconciliation of Being and beings, their intersection as *Austrag*, that is the very Play of the Difference, responds in this way to the destinal Play of meditating Thinking, together with everything that the latter supersedes, and notably Hegelianism.

Should we therefore consider the gap which opens up between these two bodies of thought as the highest fidelity to Hegel's own fidelity to the tradition? By bringing out the hidden meaning of what lies concealed, Heidegger discloses the concealment and thus makes of the Play of Difference what governs the destination of Being in its entirety. By throwing light upon the place (*Ort*) of Hegelianism and by allowing it to be comprehended, he both comprehends and makes room for meditative Thinking. In this way, Hegel's fervent struggle to understand the thinkers who preceded him is completed by Heidegger thinking metaphysics as opening up upon its own supersession. If things are indeed like this, it means that the violence apparent in the earlier texts would disappear, even that Heidegger has managed, thanks to the 'step back' effected relative to metaphysics, to come to terms with Hegelianism since his elucidation (*Erörterung*) of the latter situates it in a space that meditating Thinking is able to dominate. Carrying off (*Verwindung*) the victory would then assume the meaning of an appropriation, that of making

something his own by entering profoundly into it and transposing it upon a superior (*Überwindung*) plane. In this way the Hegelian promise of an *Aufhebung* would be fulfilled.

One has to bear in mind that the gloss on *Logos*, a gloss which regulates the interpretation of the Hegelian *Logic* certainly seems to be at the service of an appreciation of the originality of the work. By emphasizing that it is not a formal logic, Heidegger places it in the framework of transcendental logic, in order to mark the fact that it is engaged in the identification of Being and Thinking. It is true nevertheless that the elucidation of what thinking is according to Hegel is attempted nowhere, and everything takes place as if, for Heidegger, the equivalence of thinking and representing, which is implicitly admitted, continues to be valid in his reading of Hegel. As a result, the thematic difference between the *Phenomenology of Spirit* and the *Science of Logic* is no more recognized in 1957 than it was in 1930–1 or 1942–3,⁸² when Heidegger took this difference to consist in their localization in the 'system', without furnishing any explanation for the rejection of the first system (the one he called 'the phenomenological') in favour of the second (the 'logical'). We find here a scholarly effort at classifying and ordering which assumes a purely external point of view and which leads to the result that the two works are both assigned in the same way to 'subjectivity'. The latter attains an unconditional status (that is, is brought to light as a *Logic*) only when the categories which function as the condition of any appearing are represented as the *Logos* in the visibility of the absolute Idea.

Hegels 'Logik' gehört in die Phänomenologie, weil in ihr das Erscheinen der unbedingten Subjektivität erst unbedingt wird, sofern auch noch die Bedingungen alle Erscheinens, die 'Kategorien', in ihrem eigensten Sichvorstellen und Erschliessen als 'Logos' in die Sichtbarkeit der absoluten Idee gebracht werden.⁸³

It is precisely this presupposition with regard to the permanence of representation throughout the entire Hegelian system which furnishes Heidegger with an argument in favour of the assimilation of the Hegelian *Logic* to a speculative theology. The text from which he draws support in 1957 (once again a conditional subordination!) is very clear: if it is not the 'Absolute', the 'Eternal' or 'God' ('and "God" would have the most indisputable right to the point of departure'⁸⁴) which are taken as the starting point for the *Logic*, this is because there is in pure Being more than there is in the intuition or the thought which these terms arouse in our minds. It is in what is simple that there is nothing more than a pure beginning, for in the *Science of Logic* knowledge is thinking, not representing, knowledge. The conditional of the parenthesis obviously

refers to the ordinary representation of a creator God. But Hegel deliberately and explicitly distances himself from such a representation by beginning the *Logic* with the indeterminate immediacy of Being alone. Heidegger, on the other hand, suggests that, as a result of the confusion of *thinking* and *representing* which, in his view, dominates metaphysics in its entirety, Hegel thinks it does not matter whether he writes 'God' or 'Being' and that consequently *Being* is *God* for him.

In the same way, one has to be doubtful about the assimilation of *Being* and the *ground*. We will consider this matter here from the side of Being. Certainly, in the opening text entitled: 'With what does the science begin?' Hegel does bring *Being* and the *ground* back upon one another in a certain way. 'Man muss zugeben . . . dass Vorwärtsgen ein *Rückgang* in den *Grund* und zu dem *Ursprünglichen* [und *Wahrhaften*: 2nd edition] ist, von dem das, womit der Anfang gemacht wurde, abhängt [und in der *Tat* hervorgebracht wird: 2nd edition⁸⁵].' By bringing out the circularity of knowledge in this way, Hegel does not make of Being what is 'always-already-present'. It may even be assumed that by bringing the movement of Science back to its 'ground', that is to say to its truth, the very opposite of such a presencing makes itself known, indeed, that the truth is its own self-mediation, and in such a way that Being is only true to the extent that, from its initial immediacy, it is unfolded right up to its own outcome which, from the standpoint of the Concept, is just as much its foundation, a non-substantial foundation.

By putting the bifurcation of *grounding* (*er-gründen* and *begründen*) to work, Heidegger seeks to impose a doubly foundational conception of Being – a logically and a theologically foundational conception. He writes: 'die Metaphysik denkt das Sein des Seinenden sowohl in der er-gründenden Einheit des Allgemeinen, d.h. des überall Gleich-Gültigen, als auch in der begründenden Einheit der Allheit, d.h. des Höchsten über allem.'⁸⁶ According to the first conception which makes of Being 'the most universal', the formula 'Being of beings' assumes the form of an objective genitive. According to the second, beings are the beings 'of Being', and then it is a matter of a subjective genitive.⁸⁷ Furthermore, by distinguishing in Hegel an abstract God (according to Heidegger, all conceptual universality is abstract) and a creator God, it could be that Heidegger is suggesting that, in pointing to the former (and we shall see that he does this in the first pages of the *Logic*), Hegel is in reality thinking the latter. The most abstract, modelled on the causal relation, would then be taken as the origin of all the others, that is, with the difference of Being and beings remaining in the shadow of forgetfulness, even if it is in fact the chasm of the belonging-together of these two terms which is transposed into the unilateral determination of 'creation'. According to Heidegger in fact, Hegel thinks Being twice over: 'Hegel denkt das Sein in seiner leersten Leere, also in Allgemeinen. Er denkt

das Sein zugleich in seiner vollendet vollkommenen Fülle.’⁸⁸ From its first conception, that is to say as the most empty universality, it is already thought improperly (*ungemäss*),⁸⁹ according to Heidegger. He looks for a confirmation of this impropriety in paragraph 13 of the *Encyclopedia* where Hegel seeks to show that the universal is no more separated from the particular than ‘philosophy’ is separated from each particular philosophy. In the ‘Remark’, to which Heidegger attaches particular attention, the fable of the fruits illustrates the immanence of the universal in the particular. He who refuses cherries, pears, etc., one after the other, on the grounds that he wants ‘fruit’ is pretty stupid, says Hegel. So, while Heidegger seeks to read into Hegel the recognition, for Being, of a unique (*einzigartig*) mode of givenness in the invisibility of its presentation, in reality, Hegel is calling in question the formal and external conception of subsumption by virtue of which the genus, separated from its species, would be undetermined. On the contrary however, it is the Being with which the *Logic* begins which is undetermined and *this is precisely what, for Hegel, makes it impossible to treat it as a universal*. Correlatively, when Heidegger restores Being to the absolute idea which is its developed concretion, he thinks the movement of the *Logic* as one vast subsumption.⁹⁰

But we have to go further still and address yet again the question of the Heideggerian interpretation of the ‘dialectic’ across the understanding of the history of philosophy in its relation to philosophy itself. Hegel is supposed to have succeeded in undermining any separation of the ‘system’ and of history. Citing paragraph 14 of the *Encyclopedia*, Heidegger comments in these terms: ‘die erläuterte Ausserlichkeit der Geschichte im Verhältnis zur Idee ergibt sich als Folge der Selbstentäusserung der Idee. Die Ausserlichkeit ist selbst eine dialektische Bestimmung.’⁹¹ Hegel is commended for having replaced the gross (*grob*) exteriority which separates a history (*Historie*) (understood as the ‘scientific’ assessment of the succession of philosophies) and the system (understood as a doctrinal construction) with an exteriority understood as the element in which the historical (*Geschichte*) future takes up its abode – together with the effective course of each philosophy in the face of the movement of the absolute Idea.

It is therefore no longer on the basis of the experience of consciousness that the Hegelian dialectic is supposed to originate for Heidegger but rather on the basis of history, as the history of thought itself. The dialectic is therefore valid of that coming to self, or rather of that return to self, which is the movement of thought thinking itself in the very process of its speculative development. In the lecture ‘Hegel and the Greeks’, one year later than the text we have just studied, one finds a clarification of the ‘speculative’, itself linked to a clarification of the dialectic. This time Heidegger identifies the dialectic with a synthesis

between a thesis (the immediate relation of the subject to its objects, called by Hegel Being, the universal, the abstract) and an antithesis, which is the moment of reflection in which subject and object are differentiated. And so one is brought back to the point of departure in a journey (*Gang*) which gathers subjectivity together in its developed unity. This journey comprises a starting point (*Ausgang*) from the thesis, a progression (*Fortgang*) right to the antithesis, a transition (*Übergang*) over to the synthesis and a return (*Rückgang*) to self. In this way, subjectivity grows by gathering together and so becomes concrete. The 'speculative' is 'comprehension' (*begreifen*) understood in its Latin etymology: *speculari*: to look into, spy on. . . . It unifies opposites by grasping them in their reciprocal reflection. Hence, the dialectic is speculative in that it is a game of mirroring as between the subject and the object, a game which is the very process by which Spirit itself is produced.

This is the way in which the destructive work of the Hegelian dialectic is presented.⁹² Once again Heidegger overlooks negativity in favour of the positivity of the 'negation of the negation' and thanks to an all-embracing ('comprehensive' in this sense) function of the *Logos*.

If one now asks oneself what is the point of enlisting the *Science of Logic* (in fact the Hegelian system in its entirety) under the banner of metaphysics, it is worth pointing out that this assimilation could have taken a different form in Heidegger's other writings than that which it took in the lecture of 1957, but that the same decision is to be found everywhere, the decision namely to find in Hegel the ultimate symbol of the absolutization of subjectivity on the basis of its commitment to representation. 'Die ontotheologische Verfassung der Metaphysik' deserves, in this respect, to be regarded as a sort of *compte rendu* of Heidegger's entire reading of Hegelianism. The assimilation in question will be examined here according to the letter and the spirit of its accomplishment. It will all come down to a distinction which Heidegger will object to as 'facile' (*leicht handlich*⁹³) and which Hegel will denounce as 'abstract'. For all that it seems to us to offer an effective way of presenting the dialectical process.

Nominally, classing Hegelianism under metaphysics is supported explicitly by Hegel when he says of his *Logic* 'that it constitutes metaphysics in the proper sense of that word, or pure speculative philosophy'.⁹⁴ In the same Preface to the 1st edition of the *Wissenschaft der Logik*, Hegel had earlier complained that contemporary thought, obviously under the pressure of criticism, had thrown metaphysics and its traditional investigations overboard; for example, the proofs of the existence of God. In his eyes, a cultivated people who lack a metaphysics presents an almost monstrous prospect, 'like a temple . . . without a sanctuary'.⁹⁵ The Introduction, for its part, also specifies that the usual

representation of the *Logic* contains no reference to anything like a metaphysical signification. It is of course suggested that this lack is made up in the *Logic* which follows. Certainly, the texts which correspond to the latter in the 2nd edition, composed in 1831, are less nostalgic. Metaphysics meant no more to Hegel than an external material and in this respect it is placed on the same plane as the logic of history. But it continues to benefit from an evident superiority over the thought of the present age⁹⁶ in that it attests to an agreement (*Übereinstimmen*) in and of itself between things and the thinking about things. The reflective thinking of modern times rejected all this. At one and the same time, Hegel holds Kant responsible for this depreciation of metaphysics while welcoming the Kantian proposal which, though engulfed in subjectivism, does finish up by transforming metaphysics into a logic and to such a point that, according to Heidegger, Hegel himself situates the *Science of Logic* in the tradition of *transcendental Logic*. This tradition makes it possible to throw light upon the entire design of the *Science of Logic*. With regard to its specific content, the nominally 'objective' Logic takes the place of ontology, for its object is the 'ens', declined as *Being* and *Essence*.⁹⁷ Moreover, the *Science of Logic* deals with particular substrata: soul, world, God. But it does this quite independently of representation, and in such a way that these substrata become in themselves determinations of thought, as paragraph 85 of the *Encyclopedia* indicates. Fixing his eyes upon the triumphant period of metaphysics (Spinoza–Leibniz), Hegel regrets that the historical context in which he himself writes, that of post-Kantianism, should no longer be capable of receiving the language of the Absolute. But in reality, if the Kantian mutation consists not in abolishing metaphysics but in transposing it, it falls to the *Science of Logic* to retie the broken threads, to reconcile the tradition with modernity.

As for the spirit of the Heideggerian affirmation in accordance with which the Hegelian *Logic* arises out of 'metaphysics', one is tempted right away to object to it by remarking that, when Hegel claims for it an affiliation with ontology, he only invokes objective Logic, leaving to one side the Doctrine of the Concept. With reference to the latter, the Doctrine of Being and the Doctrine of Essence, *qua* sublated (*aufgehoben*), are only conserved to the extent that they are negated. The task set for the third part of the *Logic* is that of thinking freedom, that is, thinking the unity of the theoretical and the practical, accomplishing thereby the speculative design of both the Kantian and the Fichtean philosophy. Heidegger cites⁹⁸ the passage in which the absolute Idea is called 'being, imperishable life, truth knowing itself, the whole truth'. This is where the metaphysical oppositions (those of idealism) are thought, that is, thought in their unity, which is their truth.

Furthermore, it is worth returning to the supposed identification of

Being with the ground. For Hegel, the ground being a determination of reflection, the relation of the ground to the grounded undergoes a self-mediation across its own negation. From a formal ground, it becomes a real and complete ground. Being in addition the last of the determinations of reflection, the ground opens up on the immediacy not of Being but of Existence. We find here a situation which is to be confused neither with that of the foundation understood abstractly (which Heidegger calls *gründen* or *ergründen*) nor with the foundation understood on the creationist model (*begründen*). In the Doctrine of Essence, Hegelian ontology takes on the characteristics of a hermeneutics, in as much as the *Logic* seeks to respond to the question how thinking is, through language, able to accede to the unity of Being (1st book) and Thinking (3rd book). This outcome of the Doctrine of Essence makes of it a text so unprecedented in the metaphysical tradition that his reference of it to ontology certainly does not make it possible to appreciate its novelty.

And yet, is it not possible to find in the metaphysical reading of Hegelianism, proposed by Heidegger, an echo of the original intention of the Hegelian discourse? If in fact the unity of Being and Thinking is what the Hegelian Logic seeks to present, surely Heidegger rejoins Hegel in his insistence upon the fact that the Parmenidean 'enigma' forms the point of departure for all thinking? In sum, we should give Heidegger the benefit of having recognized the Hegelian design in spite of the errors which surround his grasp of the Hegelian method, and even of the results of this method, always understood as 'absolute subjectivity.'

The difference of Being and of Thinking in the Hegelian dialectic cannot be resolved into that identity of the same (whether that of Fichte or Schelling) to which Heidegger has recourse. Certainly, Hegel also says that Being and the Concept are 'the Same', but it is the reversion of the one into the other or, in other words, the self-mediation of Being as the Concept which, for him, makes up the history of Being, that is, history pure and simple. To this extent, the Hegelian *Logic* is certainly an ontology but as such it is, at bottom, and through the destruction of the determinations of reflection, the resolution of the phenomenon into effectivity.

Heidegger radically misunderstands this disposition. For when he places the Hegelian *Logic* in the perspective of Parmenides' judgment it is with a view to connecting it with Berkeley's *esse est percipi* which is the 'modern' translation of the Greek text.⁹⁹ In this way the privilege which Reason enjoys over sensibility is, in his eyes, confirmed throughout the entirety of metaphysics.¹⁰⁰ The latter devotes itself to the essence of being within the horizon (*Gesichtskreis*) of thinking and so fails to think together and in their unity, not just the sensible and the non-sensible but also thinking and Being.¹⁰¹ This failure had already been anticipated in a certain sense by Heidegger in his reading of Kant where he sees it,

on the subjective plane, as the underlying though un-thought layer of the schematism.

For him, higher and further off than their supposedly 'metaphysical' unity, there is the belonging together (*Zusammengehören*) of Being and Thinking which he interprets as harkening and as compliance. Reciprocal en-ownment (*Er-eignis*) governs the drawing together of the two into the same. The framework of Heidegger's thinking is therefore marked by a considerable consistency. It is in every instance a matter of going beyond Being and its presence towards a privileged place which lies beyond every presence and any *objectified conception of Being*. Language is this place. 'Im Ereignis schwingt das Wesen dessen, was als Sprache spricht, die einmal das Haus des Seins genannt wurde.'¹⁰²

Should one consider that at this point the two ways of thinking, that of Hegel and that of Heidegger, come together? At best they only brush up against each other. Their common effort to determine the Parmenidean unity leads the one (who shows how substance accedes to freedom) to invent a semantics of auto-reflection; it leads the other, by way of a poetic recuperation of the gift of Being, to a language-oriented ontology which runs the risk of subjecting meditative thinking to the rigidity of repetition and incantation.¹⁰³

The deficiencies which he himself pointed out were not absent from the 'thinking dialogue' that Heidegger claimed to have conducted with Hegel. As for Hegel himself, in a text cited elsewhere by Heidegger,¹⁰⁴ Hegel soberly looked forward to the kind of spiritual affinity which would make possible the task of unveiling the living spirit which inhabits a philosophy. It demanded of the interpreter a speculative generosity of a kind which is not to be found in Heidegger's reading of Hegel. His metaphysics, he writes in 1969,¹⁰⁵ is a 'mill which turns in a vacuum'. For its basis, its element and its dwelling place, is Christian theology, a theology which has been abandoned in our day. And this explains the powerlessness of the dialectic (when it is revived by Marx) to think the essence of modern technology.

In lines such as these, it would be foolish to look for a spiritual 'affinity'. Behind the dismissal of Christian theology we find an implicit restoration of paganism; behind the rejection of the Hegelian dialectic we find outlined that of Marx, together with the ambition to be the exclusive thinker of modernity. This is undoubtedly what is ultimately in question in the Heideggerian reading of Hegel.

Translated by Christopher Macann

Notes

1 Heidegger's texts are cited, as far as possible, on the basis of the *Gesamtausgabe* which is being published by V. Klostermann, cited as: *GA* . . . *GA* 1, SS. 410–11; *Zeit und Sein*, tr. Joan Stambaugh as *On Time and Being* (New York: Harper & Row, 1972), p. 6.

38 GA 5, S. 150 (‘beide sind . . . nicht das Gleiche’).

39 *Gesammelte Werke*, Bd. 9, S. 56.

40 GA 5, SS. 147–8.

41 GA 5, S. 151.

42 *ibid.*

43 GA 5, S. 151: ‘die Sache der Darstellung d.h. des absoluten Erkennens’, cf. n. 21: ‘*that is*’ is emphasized by us.

44 GA 5, S. 152.

45 *ibid.*

46 GA 5, S. 154.

47 GA 5, S. 155.

48 *Gesammelte Werke*, Bd. 9, SS. 58–60 (paras 9–13).

49 GA 5, S. 167.

50 GA 5, S. 175.

51 *Gesammelte Werke*, Bd. 9, SS. 29 and 60.

52 GA 5, S. 184. In the lectures of 1930–1, Heidegger said: ‘die Erfahrung – das ist das absolute Sicheinlassen auf das was im Lichte des absoluten Wissens erscheint’ (GA 32, S. 95).

53 GA 5, SS. 183–4.

54 GA 5, SS. 202–4.

55 Does Heidegger himself remember having commented on the 1st Epistle to the Thessalonians in his lectures of 1920–1: *Einführung in die Phänomenologie der Religion*? Here he utilizes the language of the Passion of Christ to evoke the *Phenomenology of Spirit*.

56 It is clear that Heidegger is thinking here of the famous text from the Introduction to the *Science of Logic* (cf. *Gesammelte Werke*, Bd. 11, S. 21 and Bd. 21, S. 34) which presents the contents of the Logic as ‘God as He is in His eternal essence prior to the creation of Nature and of a finite spirit’. He had already cited this passage in his Kant book (cf. (Frankfurt: Klostermann, 1951), S. 220).

57 GA 5, S. 155.

58 *Gesammelte Werke*, Bd. 9, S. 62.

59 GA 5, SS. 196–7.

60 *Gesammelte Werke*, Bd. 9, S. 57 (emphasis added).

61 *ibid.*, Bd. 9, S. 134.

62 *ibid.*, Bd. 9, S. 137.

63 One finds this particularly with H. G. Gadamer who writes: ‘das Wesen der Erfahrung wird hier [sc. bei Hegel] von vornherein von dem her gedacht, worin Erfahrung überschritten ist’ (*Wahrheit und Methode* (Tübingen: J. C. B. Mohr, 1965), S. 338; emphasis added). Gadamer also speaks of the ‘application’ (*Anwendung*) made by Hegel to the history of the overcoming (*Überwindung*) of all experience, that is, of the identity of consciousness and the object.

64 *Gesammelte Werke*, Bd. 9, S. 62 (text cited earlier).

65 *ibid.*, Bd. 9, S. 24.

66 GA 5, S. 202: ‘das absolute Wissen . . . ist die Darstellung des Erscheinens des daseienden Geistes.’

67 GA 32, SS. 141–2.

68 ‘Die ontotheologische Verfassung der Metaphysik’ was published (preceded by ‘Der Satz der Identität’, under the title *Identität und Differenz* (Pfullingen: Neske, 1957), hereafter *ID*, S. . . . The text of the seminar by Heidegger devoted to the ‘Wissenschaft der Logik’ has not yet been published at this time.

ID, S. 32. One might be surprised by Heidegger’s choice of ‘der Gedanken’ for what Hegel calls, in paragraph 14 of the *Encyclopedia* cited here by Heidegger and in paragraph 19 cited in *Einführung in die Metaphysik* (GA 40), *das Denken*; with Hegel, *der Gedanke* leans towards thought understood subjectively (cf. para. 465 *Enzyklopädie*: (die Gedanken) sind . . . Inhalt und Gegenstand (der Intelligenz)). Undoubtedly, Heidegger finds in ‘Gedanke’ the ‘Dank’ which, for him, is the meaning of *Denken*.

69 *ID*, S. 34.

70 *ID*, S. 35 – *geschichtlich* is distinguished from *historisch*.

71 *ID*, SS. 43–4.

72 *ID*, S. 45.

73 cf. his Commentary to fragment 50 of Heraclitus – and *Einführung in die Metaphysik* (GA 40, SS. 130–5).

74 cf. *Der Satz vom Grund* (Pfullingen: Neske, 1957), hereafter *SG*.

75 *ID*, S. 48: ‘Das Sein des Seienden entbirgt sich als der sich selbst ergründende und begründende Grund’ and S. 49 (ll. 1–4).

76 *ID*, SS. 48, 49, 50, 61, 62.

77 cf. above n. 56.

78 *Gesammelte Werke*, Bd. 21, S. 65 and *ID*, S. 44. One thinks here of the text *Nietzsche II* (Pfullingen: Neske, 1961), S. 347, where ‘metaphysics’ (Hegel is not named) is presented as accommodating three senses in which beings takes the place of Being (to wit: the supreme being – *das höchste Seiende*, the distinctive being – *das ausgezeichnete Seiende* (the transcendental subject) and the Absolute in the sense of unconditional subjectivity. In what follows Heidegger writes: ‘Die Ontologie stellt die Transzendenz als das Transzendente vor. Die Theologie stellt die Transzendenz als das Transzendente vor’ (S. 349). In the lecture of 1957, the Hegelian Absolute has the function of assuming the different acceptations of metaphysical transcendence.

80 *ID*, SS. 34–5.

81 *ID*, S. 41.

82 GA 32, SS. 1–13; GA 5, S. 195.

83 *Nietzsche II*, S. 299 (text dates from 1940).

84 *Gesammelte Werke*, Bd. 21, S. 57 (the parenthesis is emphasized by us). It is always possible that the parenthesis which evokes a 'right' of God to be taken as the beginning of the Science, is charged with irony.

85 *Gesammelte Werke*, Bd. 11, S. 34; Bd. 21, S. 57.

86 *ID*, S. 49.

87 *ID*, S. 53.

88 *ID*, S. 47.

89 *ID*, SS. 57–8.

90 This interpretation is contained in germ in the text from 1946 devoted to the 'Sayings of Anaximander', where Heidegger wrote:

die Logik, der Metaphysik entsprungen, und sie beherrschend, [hat] dahin geführt, dass der in den frühen Grundworten geborgene Wesensreichtum des Seins verschüttet blieb. So konnte das Sein in den fatalen Rang des leersten und allgemeinsten Begriffes hinaufgelangen.

(GA 5, S. 352)

91 *ID*, S. 34.

92 Paragraphs 79 and on from the *Encyclopedia*, which Heidegger is evidently thinking of when he connects the dialectic with the speculative (cf. his 1966–7 course on Heraclitus) make of the speculative the 'positively rational' aspect, the dialectic making up the 'negatively rational' side. One can note that, when Heidegger tries to think Hegelian negativity in a real way, it is in the shadow of Schelling's problematic of evil, that is to say, of a typically onto-theological problematic (cf. *Nietzsche I*, SS. 73–4).

93 *SZ*, para. 17.

94 *Gesammelte Werke*, Bd. 11, S. 7.

95 *ibid.*, Bd. 11, SS. 5–6.

96 *ibid.*, Bd. 21, SS. 29–35.

97 *ibid.*, Bd. 11, S. 31 and Bd. 21, SS. 48–9.

98 In *ID*, S. 32.

99 cf. Moira, a part of the lecture 'Was heisst Denken?' of 1952 (GA 8).

100 'Sofern die Aufhellung und Bestimmung der Vernunft "Logik" genannt werden darf und muss, lässt sich auch sagen: die abendländische "Metaphysik" ist "Logik"; das Wesen des Seienden als solchen wird im Gesichtskreis des Denkens ausgemacht' (*Nietzsche I*, S. 530). It is worth noting that in the text devoted to 'The end of philosophy and the task of thinking', one of the latest of Heidegger's writings, Hegel is cited and thought through along with Husserl, the two sharing in common the characteristic of identifying the Business of Thinking with the subjectivity of consciousness. From para. 82 of *SZ* therefore, the buckle is buckled!

101 *SG*, SS. 88–9:

die Aufstellung [der] Scheidung des Sinnlichen und Nichtsinnlichen, es Physischen und des Nichtphysischen ist ein Grundzug dessen, was Metaphysik heisst und das abendländische Denken massgebend bestimmt. Mit der Einsicht, dass die genannte Unterscheidung des Sinnlichen und Nichtsinnlichen unzureichend bleibt, verliert die Metaphysik den Rang der massgebenden Denkweise.

102 *ID*, S. 28.

103 *SG*, SS. 146–7:

[der Mensch steht] seinem Wesen nach im Offenen des Entwurfes des Seins. . . . Durch das so erfahrene und gedachte Seinsverständnis ist die Vorstellung des Menschen als eines Subjektes, um mit Hegel zu sprechen, auf die Seite gebracht. Nur insofern der Mensch seinem Wesen nach in einer Lichtung des Seins steht, ist er ein denkendes Wesen. Denn im altersher besagt in unserer Geschichte Denken so viel wie: dem Geheiss des Seins entsprechen und aus dieser Entsprechung das Seiende in dessen Sein durchsprechen. Dieses Durchsprechen (*διαλεγεσθαι*) entfaltet sich in der Geschichte des abendländischen Denkens zur Dialektik.

This text throws a remarkable light upon the confrontation of Heidegger with Hegel. Without even underlining the insolence which consists in utilizing an expression which is relatively frequently employed by Hegel (*auf die Seite bringen*) to dismiss Hegelianism, one has to note that, in placing the essence of Man in the open or in the clearing of Being, Heidegger thinks he is being faithful to an acceptation of *διαλεγεσθαι* which 'metaphysics' (principally that of Hegel) is supposed to have distorted into 'dialectics'.

104 GA 32, S. 44 and *Gesammelte Werke*, Bd. 4, S. 9.

The last thinker of the West

David Farrell Krell

For Al Lingis

'The thesis of Heidegger's *grand livre* [that is, his *Nietzsche*, published in two volumes in 1961] is much less simple than people have generally tended to say', writes Jacques Derrida, quite justly.¹ In fact, his remark applies to *all* of Heidegger's texts on Nietzsche. Sufficient warning that any effort to explicate in a dozen pages *die Sache* of Heidegger's prolonged and intense confrontation with Nietzsche remains futile. Let this brief chapter invite and incite efforts that will demand more time and greater solicitude.

It is tempting to compare Heidegger's confrontation with Nietzsche to his companionship with Hölderlin. Heidegger himself would picture the latter as the proximity and intimacy of two pines rooted in the silent forest earth; the 'neighborhood of the chanting poet' constitutes a 'wholesome danger' to the thinker. Hölderlin and Heidegger: no cloud ever darkens their sky, a sky that stretches across the expanse of the clearing that is held open by the very distance that separates thinker from poet.

In contrast, Nietzsche, whom Heidegger from the outset acknowledges as *Denker* rather than *Dichter*, encroaches on Heidegger's own space. Nietzsche does not declaim from one distant mountain peak to Heidegger perched on another – an image one might fashion to characterize the conversation between great thinkers – but infiltrates and crowds close, implants doubts and eradicates convictions, whispers Heidegger's own second thoughts to him, illuminates and confounds at once. Their confrontation is stormy. Late in that *Auseinandersetzung* Heidegger confesses that he has had to take with utmost seriousness Nietzsche's message to Georg Brandes: that it is no great trick to *find* Nietzsche, the challenge being rather to learn how to *lose* him, that is, to release Nietzsche to his own place in the history of metaphysics. Yet Heidegger

never really loses Nietzsche, never 'locates' him, never shakes free of him, because Nietzsche never releases his grip on Heidegger. That is fortunate. The tempestuous encounter with Nietzsche prevents Heidegger from becoming what we have only now accused him of being – a bloodless shade of Hegel. The piety of Heidegger's questioning and the apparent quietism of *Gelassenheit* are everywhere undercut by the passion of Nietzschean suspicion and the rage of a descensional reflection without cease. To repeat: history of Being is not history of spirit. That is Nietzsche's primary, decisive incision; that is his deepest cut. And there is no poetic annealing, no restoration of the Absolute in hymns –

if Mozart is (as Heidegger says) 'God's lute-play';
 if Hölderlin plucks the lyre while God withdraws in irreversible retreat;
 if Trakl, as we shall see, rescues the lyre as it slips from Hölderlin's hands and with it sings the palsied deity, the progenitor of a ruined race;

it is nonetheless Nietzsche the thinker who must inter the defunct and toneless divinity with all his instruments, Nietzsche the thinker who must fashion for the philosopher a new lyre. Less companionable than the men of music and hymn, Nietzsche nonetheless accompanies Heidegger early on and to the end.

Precisely when Heidegger first read Nietzsche we do not know.² But he studied the philosopher's works during his student years at Freiburg, 1909–14, especially the second, expanded edition of the *Nachlass* material published as *The Will to Power* (1906). Two decades later that text served as the source for the topics of Heidegger's lectures on Nietzsche: the will to power as art and as knowledge, from Book Three, sections I and IV; the eternal recurrence of the same, from Book Four, section III; and nihilism, from Book One. The volume also had an impact on Heidegger's early writings, not as an explicit theme for investigation, but as an incentive to philosophic inquiry in general. During his *venia legendi* lecture of 1915, 'The concept of time in the discipline of history', Heidegger alluded to philosophy's proper 'will to power' (*FS*, 357). By that he meant the need to advance beyond epistemology to metaphysics, that is to say, to interrogation of the goal and purpose of philosophy as such. In his Habilitation thesis (1915–16) Heidegger revealed the influence of Nietzsche when he stressed philosophy's function 'as a *value for life*' (*FS*, 137–8). Philosophy as such exists 'in tension with the living personality' of the philosopher, 'drawing its content and value from the depths and the abundance of life in that personality'. In this regard Heidegger cited Nietzsche's formula 'the drive to philosophize', and he praised that writer's 'relentlessly austere manner of thought', a manner enlivened, however, by a gift for 'flexible and apt depiction'.

During the decisive Marburg years, 1923–8, Nietzsche appears to have withdrawn completely from Heidegger's central concerns, making room for Aristotle, Kant, and Husserl. Heidegger apparently wished to distance himself from the Nietzsche adopted by *Lebensphilosophie* and by the philosophies of culture, worldview, and value. As I noted at the very outset, in chapter one [of *Intimations of Mortality*; *IM* hereafter], his rejection of the category 'life' and adoption of 'existence' for his nascent analyses of Dasein had come to light already in 1919–21, the years of his confrontation with Karl Jaspers' *Psychology of Worldviews*. His spurning of the neo-Kantian value-philosophy of Wilhelm Windelband and Heinrich Rickert undoubtedly delayed Heidegger's public confrontation with the philosopher who sought the revaluation of all values. Yet throughout the 1920s Nietzsche's style of thought continued to captivate Heidegger. For example, in the midst of an otherwise dry-as-dust, utterly sober phenomenological account of Husserlian intentionality, categorial intuition, and the a priori, which Heidegger proffered in his 1925 lecture course on *The Concept of Time*, we find the following remarkable avowal:

Philosophical research is and remains atheism; for that reason it can afford 'the arrogance of thought'. Not only will it afford such arrogance, but this is the inner necessity and proper force of philosophy, and precisely in such atheism philosophy becomes – as one of the greats once said – 'the gay science' [*Fröhliche Wissenschaft*].

(20, 109–10)

Phenomenology as rigorous science, *but with gaiety*: neither Husserl nor even Scheler was equal to it!

Yet there is little gaiety in the masterwork that concludes Heidegger's Marburg period, *Being and Time*. Only three references to Nietzsche's thought appear in that text; and only one of them is a substantive reference.³ Nevertheless, as we have seen in chapter six [of *IM*], the 'fundamental experience' of *Being and Time* and Heidegger's reading of Nietzsche are intimately related. At the close of that chapter I cited Heidegger's essay 'Nietzsche's proclamation: "God is dead"', to this effect: 'The following commentary, in intention and scope, keeps to that one experience on the basis of which *Being and Time* was thought' (*H*, 195; cf. *N II*, 260). If that one experience be the oblivion of Being, which implies forgottenness of the nothing in which Dasein is ever suspended, then we may say that in *Being and Time* Heidegger brings the question of the death of God home by inquiring into the death of Dasein and the demise of metaphysical discourse. Among the principal motifs of *Being and Time* are: the finite, ecstatic horizon of the being that is Dasein; the interpretation of Dasein as care or possibility-being, structured temporally as existential, factual, and falling; and the being-a-

whole (*Ganzsein*) of Dasein as being-unto-death (*Sein zum Tode*). However rarely cited in *Being and Time*, Nietzsche may well be the regnant genius of that work – Nietzsche, who

exposes the anthropomorphic base of metaphysical projections and the evanescence of Being understood as permanence of presence;

supplies genealogical accounts of time and eternity in such a way that the latter appears as vengeance wreaked on the former;

confronts without subterfuge human existence as irredeemably mortal, bursting with possibility yet bound to fatality;

insists always and everywhere that on this earth thinkers as well as artists must (in Ezra Pound's words) 'make it new'.

In writing these things I approach the core of the Heidegger/Nietzsche confrontation and encounter which dominate the 1930s, 1940s, and early 1950s in Heidegger's career of thought.

Let me now try to formulate some of the principal themes of Heidegger's published works on Nietzsche and to state what I take to be the profound and enduring impact of these themes on Heidegger's own thought. Although my presentation will not be uncritical, I will at no point ask whether Heidegger's reading of Nietzsche is 'adequate' or whether Heidegger 'represents' Nietzsche fairly: in the first place, Heidegger does not purport to 'represent' Nietzsche, and in the second, no matter how 'inadequate' his reading of Nietzsche may be, Nietzsche himself, born posthumously, retains his own style and stylo, makes his own counterthrusts, dances his own defence. I offer my aid, he laughs. Nor, alas, do I have the requisite space to indicate the importance of Heidegger's reading for contemporary confrontations with Nietzsche, especially in France, from Bataille through Deleuze and Klossowski to Foucault and Derrida.

Nihilism and the end of metaphysics

With his announcement of the death of God and the collapse of all worlds 'beyond', Nietzsche becomes the historian and herald of nihilism. The history of nihilism comprises the rise and fall of the highest values hitherto, values such as 'purpose', 'unity', 'Being', and 'truth'. But thanks to his insight into the origins of nihilism in the very instauration of otherworldly values, that is, the identity of nihilism and moralistic metaphysics, Nietzsche also becomes the herald of 'perfect' or 'ecstatic' nihilism. Heidegger shares Nietzsche's suspicion that nihilism is not a recent, typically modern phenomenon; he accepts Nietzsche's judgment that the reign of nihilism is coterminous with that of Platonistic metaphysics. This epochal reign reaches its apotheosis when the horizon that once demarcated the 'true' from the 'merely apparent' world fades, when the

true world 'becomes a fable'. When he pierces the horizon of 'the true' – not satisfied merely to invert the Platonistic hierarchy of the sensuous and supersensuous, Becoming and Being – Nietzsche precipitates the crisis of metaphysics.

At the same time, however, by insisting on a revaluation of values, as though there might be some absolute standard (such as 'life' or 'will to power') by which values might be gauged and promulgated, and by treating nihilism ultimately as an affliction of which Occidental history might be cured, Nietzsche remains caught in the orbit of metaphysical thinking, trapped in passive-reactive nihilism. Samson indeed brings down the temple, but on his own head. Thus we attain a first glimpse of the irresolvable ambiguity and even ambivalence of Heidegger's reading of Nietzsche: pursuing the question of the horizon of 'the true', Nietzsche nonetheless fails to pose the question of the essence of truth, *das Wesen der Wahrheit*, and fails to see that his own critique of 'the true' presupposes the traditional notion of truth as *adaequatio*, *homoiōsis*; conceiving of his philosophy early on as the overcoming of Platonism, Nietzsche nonetheless fails to recognize the fatal kinship of revaluation with the *idea tou agathou* and thus fails to recover the tradition by means of an originary reading of the early Greek thinkers; subjecting Cartesian subjectivism and intellectualism to a scathing critique, Nietzsche nonetheless fails to draw the full consequences of his discovery that *ego volo* is but a brainchild of *ego cogito* and fails to recognize that the mere substitution of 'body' for 'spirit' cannot overcome representational thought; desecrating the origin of nihilism in the pristine establishment of transcendent values, Nietzsche nonetheless believes that some values can be rescued from nihilism; advocating a fully developed, ecstatic nihilism, sprung from the depths of tragic wisdom, Nietzsche nonetheless fails to confront the question of the essence of the *nihil* and fails to experience the source of nihilism in the happenstance that in Western history *Being itself comes to nothing*.

The ambiguity – and ambivalence – in Heidegger's reading of Nietzsche may best be expressed in two questions. How is it possible that Nietzsche's philosophy implies nothing less than the *end* of metaphysics, and yet *is itself* a metaphysics? How can Nietzsche be called *the last* metaphysician and yet still be considered *one* metaphysician among others?

The metaphysics of will to power and eternal recurrence

Will to power and eternal recurrence of the same are the crucial poles of Nietzsche's metaphysics, the other key words – nihilism, revaluation, 'justice', and overman – revolving about them. Heidegger insists that these two thoughts constitute a unity, that they designate what scholastic

philosophy called the *essentia* and *existentia* of entities. This implies that will to power and eternal recurrence are responses to the ancient ontological question *ti to on*, in the metaphysical form, 'Was ist das Seiende?', 'What is the being?'. They are replies to the guiding question within metaphysics (*die Leitfrage*) but not to the grounding question concerning metaphysics as such (*die Grundfrage*). The putative unity of will to power and eternal recurrence, as the essence and existence respectively of all beings, at times assumes a merely schematic, almost syllogistic form in Heidegger's lectures and treatises: If will to power is a self-willing that brooks no obstacles, then its unconditioned willing can only be a perpetual self-overcoming; any being that is essentially will to power can exist solely as eternal recurrence of the same. This schematic interpretation tends to understand will to power cosmologically (and thus metaphysically) rather than to employ it genealogically; it woefully underestimates the exhilarating and devastating import of Nietzsche's supreme and most burdensome thought – *die ewige Wiederkehr des Gleichen*. In his haste to refute Alfred Baeumler – who embraced a politicized will to power while spurning the 'Egypticism' of eternal recurrence, thus proclaiming the lamentable *disunity* of Nietzsche's thought – Heidegger at times neglects the multiple perspectives of will to power and the tragic pathos of eternal return. Yet Heidegger shares Jaspers' conviction that recurrence is Nietzsche's central thought and he devotes his best interpretive efforts to it, not only during the summer semester of 1937 but also in lectures delivered in the early 1950s. However, before taking up discussion of eternal recurrence, I must elaborate somewhat on Heidegger's criticism of Nietzsche's metaphysics.

Will to power and valiative thought

According to Nietzsche, will to power is 'the ultimate fact we come down to'. To Heidegger's ear *das letzte Faktum* has an unmistakably metaphysical ring. Just as Heidegger's own asseverations on the metaphysical *Urfaktum* of temporality become increasingly suspect to him after the publication of *Being and Time*, as we saw earlier in the second and third chapters of this volume [cf. *IM*], so too Nietzsche's desire to define the very essence of beings seems futile to Heidegger. (Of course, it is Nietzsche, with his genealogy of the *causa prima* – the 'first cause' originating in 'laziness', 'weariness' – who helps to make such tendencies suspect!) Nevertheless, Heidegger eschews the genealogical employment of will to power and rejects its cosmological-biological usage. There is little left to be said, other than that will to power seems to derive from Leibnizian *vis* and *appetitus* and from the interpretations of 'will' in Kant, German Idealism, and Schopenhauer. Heidegger does say all this, in

spite of his warning that to trace probable dependencies and influences among thinkers is to forget their universal dependence on Being and its destiny. Only in his first lecture course, *Will to Power as Art*, does will to power receive sympathetic and thought-provoking treatment. There it is seen as nothing less than an ecstatic being-beyond-oneself in the manner of human existentiality or finite transcendence. As perpetual self-overcoming, will to power is another word for *epimeleia*, *Sorge*, 'care'. As I indicated in chapter six [of *IM*], Hannah Arendt is right when she notes that the later lectures and essays (in volume II of *Nietzsche*) abandon this positive interpretation of will to power and equate Nietzsche's doctrine with the will-to-will that inaugurates the reign of planetary technology.⁴ Whether Heidegger ever truly overcomes the schematic 'cosmological' interpretation of will to power – as the *essentia* of entities – may be doubted; certainly there is no breakthrough here to fundamental problems, as there is in Heidegger's thinking of eternal recurrence.

The negative balance in Heidegger's account of the metaphysics of will to power is chiefly due to the role of value thinking (*Wertdenken*) there. Heidegger's allergic reaction to Nietzschean 'revaluation of all values' derives partly, as I have noted, from his own rebellion as a student and young teacher against the influential neo-Kantian *Wertphilosophie* of his mentor, Heinrich Rickert. Throughout his career, Heidegger inveighed against the philosophy of value as a debasement of Kant's philosophy. Although Nietzsche seems to have recognized the necessity of overcoming Platonistic valuation as such, Heidegger faults him for retaining confidence in 'values' themselves, indicts him for the unfounded hope that this lame duck of Kantian–Cartesian subjectivism, this insipid residue of secularized Christianized *aretē*, could rescue Occidental humanity from its own essential history – nihilism. In value thinking Heidegger sees the major obstacle to Nietzsche's advance beyond metaphysical modes of thought. The project of revaluation deflects and distracts Nietzsche from the questions of Being, truth, and the nothing. Nietzsche comes closest to those questions in his thought of eternal recurrence.

Eternal recurrence, time, and downgoing

Nietzsche's sundry communications of eternal recurrence, in *The Gay Science*, *Thus Spoke Zarathustra*, *Beyond Good and Evil*, and various unpublished sketches, convince Heidegger that eternal recurrence is not so much a dogma as an experience in and of *thinking*. It has to do, not so much with the *existentia* of beings (as the treatises published in volume II of *Nietzsche* tend to assume), as with 'existence' in both Jaspers' and Heidegger's senses. In the summer semester of 1937 Heidegger struggles

to confront the full import of Nietzsche's tragic insight into Becoming and his Dionysian affirmation of it.

The previous semester's course on will to power as art had focused on the opposition – indeed, the 'raging discordance' – between art and truth. Art, the creation of transfigurative semblance, proved to be worth more than truth for the enhancement of life. Such enhancement occurred in what Nietzsche called 'the grand style', the enraptured style that conjoined under one yoke the rule of form-giving law and the anarchy of originary chaos. Nietzsche's discovery of the yoke, the most life-enhancing thought and most powerful dissemblance, fashioned in the raging discord between art and truth, was given the title 'eternal recurrence of the same'. Heidegger insisted that this thought had something – perhaps everything – to do with the question of Being and Time, Time and Being.

Standing in the 'gateway of the Moment' – not simply observing the gateway from the side, as does the dwarf, who makes everything too easy for himself – Zarathustra is cast into *time*. The figure of Zarathustra thus serves as an image of perspicuous, resolutely open Dasein. The 'eternity' of eternal recurrence is not that inappropriate nonfinite time which, according to *Being and Time* section 65, is derived from finite time proper, but the moment (*der Augenblick*) of insight and decision. On the threshold of the moment of time Zarathustra affirms that all transition (*Ubergang*) toward the overman (*Übermensch*) ineluctably requires downgoing (*Untergang*).⁵ Zarathustra's contempt for the 'last man' and his disgust with humanity in general, his nausea, are confronted and overcome in the thought of recurrence – although what 'overcoming' now may mean becomes a capital question, one that cannot be resolved by a polite reference to 'self-overcoming'. Zarathustra's convalescence consists solely in thinking this thought – although the thought itself, as the most powerful dissemblance, at times seems to be a ditty cranked out on a barrel-organ, a child's entertainment offering sheer distraction from the harsh realities of historical existence. In Heidegger's view, all depends on the actual work, *die Wirk-lichkeit*, of the thinking itself. All depends on fashioning the lyre that will sustain the tension of discord, the tension of the Heraclitean bow (Yeats calls it life-in-death, death-in-life), the tension that will hold the melody of mortality.

Neither Nietzsche nor Heidegger is unduly optimistic about the success of such work. Nietzsche has Zarathustra describe himself as a cripple on the hither-side of the bridge that leads to redemption from revenge. In his final lectures and essays on Nietzsche, Heidegger persists in posing the crucial question of such redemption. All his earlier preoccupations culminate in the question, 'Who is Nietzsche's Zarathustra?' With a view to the thought of eternal recurrence, this question translates to the query, 'What is called – and what calls for – thinking?'

The decisive work – thinking recurrence – takes place, according to Heidegger, in the section of *Thus Spoke Zarathustra* entitled 'On redemption'. There the spirits of vengeance, gravity, and resentment, themselves the propitiating spirits of otherworldly metaphysics and morals, are perceived as arising from the frustration of man's will in the face of time's irreversibility. Before the facticity of the 'it was' the will stands helpless. It is not merely that the ephemeral character of Becoming paralyzes the will, nor that transience gives rise to the castrating nostalgia for the *ewige Weibliche*. What is truly crippling is

the sheer intransigence of the past,
the intractability of the *fait accompli*,
the lapidary impassivity of what used to be.

Rather than will nothing at all, the harried will wills the nothing: hence the enervating delirium of passive nihilism. Rather than affirm the ordinance of time, the will conjures a counterwill to fulminate against time and its '*Es war*': hence the movable feast of rancor and revenge.

Redemption from the spirit of vengeance, the transformation of reactive nihilism into ecstatic nihilism, and the transfer of allegiance from the Crucified to Dionysos require that the will declare of the past, 'Thus I willed it, I will it so now, and thus shall I will it forever!' Willing the eternal recurrence of the same reconstitutes the 'it was' as a 'so be it', dissolves the impassivity of the past in the potent solution of its present willful act. Thus man 'administers the proof' that the contingencies of the past conform to what will to power itself wills; thus humanity earns 'the right to claim' that the happenstances and hazards of the past are its own doing; thus the past is transmuted into perpetual future by a will that 'continually remains presence-to-self'.⁶

Heidegger doubts the efficacy of such willing to perform the redemptive work of eternal recurrence. 'Thus I willed it!' declares the will. What is the source of such a declaration? It asseverates something of the past in the present. Can what it avers of the past be affirmed in the gateway of the Moment, where time looms before me and then recedes over my shoulder to a remote eternity? Or must such a declaration proceed from the side, in the dwarf's perspective, as a (now) transparent ruse? Reconstituting the 'it was' as a 'so be it' – is that not to subordinate *Sein* to *Sollen*, and not to *Wollen*, in the manner of the most supine Platonism? To dissolve the impassivity of the past in the activity of a willful present – is that not to embrace the traditional metaphysical preference for activity over passivity? What sort of 'proof' would convince the genealogist that contingency has been successfully converted into will? Has not the ditty of proofs been played out? What sort of

droit de prétendre will transform the victim of chances into the demiurge of destinies? And when the past is transformed into perpetual future by a will that remains perpetually present to itself, is not the metaphysics of presence, that is to say, the ontology based on the understanding of Being as permanence of presencing (*Beständigkeit des Anwesens*), merely confirmed in its dominion? The paradoxical assurance that the will's perpetual presence to self is a perpetual sacrifice of self, an infinite self-overcoming, does not convince: 'perpetual sacrifice' offers up the same old lamb over and over again, and it no longer fools gods or men.

All these doubts about 'redemption' – about what one might call the *decadence* of redemption – trouble Heidegger. They culminate in his charge that Zarathustra's teaching on redemption fails to liberate metaphysical man from the spirit of vengeance:

Does such thinking overcome prior reflection, overcome the spirit of revenge? Or does there not lie concealed in this very *stamping* [cf. *The Will to Power*, no. 617] – which takes all Becoming into the protection of eternal recurrence of the same – a form of ill will *against* sheer transiency and thereby a highly spiritualized spirit of revenge? . . . What is left for us to say, if not this: Zarathustra's doctrine does not bring redemption from revenge? We do say it. Yet we say it by no means as a misconceived refutation of Nietzsche's philosophy. We do not even utter it as an objection against Nietzsche's thinking. But we say it in order to turn our attention to the fact that – and the extent to which – Nietzsche's thought too is animated by the spirit of prior reflection.

(VA, 121–2; Ni 2, 228–9)

Thus Heidegger does not close the question of Nietzsche's place in the history of metaphysics. Who is Nietzsche's Zarathustra? Zarathustra is the advocate of the circle of life and suffering; redemption from the circle is not his proper brief. Zarathustra espouses the goal of overman; he dare not confuse himself with the goal. Zarathustra recognizes all transition to be a downgoing; he dare not quit the doorway of the moment of time. In short, the work of eternal recurrence, as the work of *thinking*, remains to be done.

The last thinker of the West

How can Nietzsche be called the *last* metaphysician and yet still be considered one metaphysician among others? If Nietzsche were wholly absorbed by the 'guiding question' of metaphysics, completely oblivious

to its 'grounding question'; if he had thought purely and simply in terms of values, merely inverting the 'above' and 'below' of the Platonic hierarchy; if his analysis of nihilism had remained but a phase in the history of nihilistic metaphysics; how then could Nietzsche have exhausted the possibilities of metaphysical inquiry, of representational and valuative thought, and how could he have envisaged the event of metaphysics as nihilism? If the 'last name' in the history of metaphysics 'is not Kant, and not Hegel, but Nietzsche',⁷ then *how* is Nietzsche able to draw a line under his own name and so call an entire tradition to account?

From the outset of his confrontation with Nietzsche, Heidegger accords him the status of a thinker; that is, one who ponders the essence of metaphysics itself. In 'What calls for thinking?' Heidegger designates him, not the last metaphysician, but 'the last thinker of the West', *der letzte Denker des Abendlandes* (WhD? 61; cf. H, 94). The word *letzt* could mean several things:

Nietzsche the *most recent* thinker, *le dernier cri*?

Nietzsche the *ultimate*, that is, the supreme and superlative thinker?

Nietzsche the *final* thinker, that is, the thinker of finality, after whom no one is to be expected, after whom the West as such, or thinking itself, or both of these together, can no longer be what they once were?

This third understanding of the word *letzt* would of course place in jeopardy the claim of any contemporary *to be* a thinker. . . .

Nietzsche's impact on Heidegger's thought is second to none. In 'What calls for thinking?' Heidegger deliberately couples Nietzsche's name with that of Aristotle, a telling conjunction when one remembers the cardinal position of Aristotle in awakening the question of Being. The Heidegger/Nietzsche encounter occurs across a long series of shared sites – junctions, crossroads, intersections and interceptions, underpasses and ambushes. To cite a few:

Nietzsche's definition of a strong will as one that knows how *not* to will (*S II*, 987–9) is an unsung precursor of Heidegger's *Gelassenheit* and 'commemorative thinking';

Zarathustra's cry, 'Be true to the earth!' is heard again in Heidegger's pledge to the earth of the Fourfold and in his initiation of mortals to their mortality;

Nietzsche's role, assisting Kant, Schiller, Schelling, and Hölderlin in awakening in Heidegger a sense of the primacy of art and the artwork in the question of Being, becomes clearly visible when will to power as art is proclaimed the 'necessary point of departure' for Heidegger's inquiry into Nietzschean thought;

Nietzsche's critique of metaphysics helps to propel Heidegger beyond the incipient 'meta-ontological turn' of his own thought – from 'ontology of Dasein' to 'the metaphysics of truth' – in the years immediately following the publication of *Being and Time*; and, most generally,

Nietzsche implants the suspicion that an entire epoch of thought and belief has inevitably succumbed, that what we piously call 'tradition' is for the most part a product of anxiety in the face of thinking.

Beyond piety, yet still within anxiety, I ask again what Heidegger means when he calls Nietzsche *den letzten Denker des Abendlandes*. Is Nietzsche (1) the most recent, current, and topical of thinkers; is he (2) the ultimate and superlative thinker; or is he (3) the final thinker of the evening land? The first is too innocent for Heidegger, the second too edifying. Both in any case would actually be said otherwise in German. Only the third (and *last*) is risky enough, outrageous enough, literal enough, to suit Heidegger's estimation of Nietzsche. If at times nothing seems new under the sun of Heidegger's history of Being, it is because he too needs to protect himself from Nietzsche's newness. Thus Heidegger's thinking *counter* to Nietzsche remains always in service to a thinking to *encounter* him. *Auseinandersetzung* remains subtended by an *Entgegend-enken*, confrontation by an encounter.

On the eve of his lecture series on Nietzsche, Heidegger defined the task of his own thought as one of bringing Nietzsche's thought 'to a full enfolding' (*EM*, 28). The confrontation and encounter with Nietzsche, nascent in Heidegger's student days and still vital in the conversations of his last years, remained crucial for Heidegger – for knowing who he was and what he was to do.

All of which brings us now to the question of the *results* of Heidegger's history of Being. Can descensional reflection transcend mere intimations to hard and fast results that would be relevant for the technological age in which we live?

Notes

1 *Eperons: les styles de Nietzsche* (Paris: Flammarion, 1978), p. 60. Derrida's discussion of Heidegger/Nietzsche on pp. 59–102 of *Eperons* is more subtle and suggestive than his earlier remarks in, for example, *De la grammatologie* (Ed. de Minuit, 1967), pp. 31–3, 'La structure, le signe et le jeu', in *L'écriture et la différence* (Ed. du Seuil, 1967), pp. 412–13, or 'Les fins de l'homme', in *Marges de la philosophie* (Ed. de Minuit, 1972), pp. 161–4.

2 For the following see my 'Analysis' to *Ni* 1, 245–7.

3 See *SZ*, 264, lines 15–16; 272 n. 1; and, the key reference, to Nietzsche's 'On the advantage and disadvantage of history for life', 396, lines 16ff.

4 Her attempt to explain the change in terms of some sort of personal remorse is highly dubious, however. See Hannah Arendt, *The Life of the Mind*, II, 172–8, and chapter six, above [cf. *IM*].

5 The word *Übergang*, we recall, united the metabolic 'now' in Aristotle's treatise on time and the *metabolē* of fundamental ontology itself. See chapter three, above [cf. *IM*], and my 'Analysis' in *Ni* 2, 276–8.

Critical remarks on the Heideggerian reading of Nietzsche

Michel Haar

In a short and surprising marginal note to the 1936–7 lecture on ‘The will to power as art’, Heidegger writes: ‘The bitterness of the strife [*Auseinandersetzung*] is possible here only because it is supported by the most intimate kinship, by the Yes to the essential.’¹ What kinship? What is this ‘essential’ he admits he shares with Nietzsche? There is no further explanation here, nor in the later works, about the nature of this secret agreement, which is indeed very rarely acknowledged, and nevertheless must underlie the manifest, long and harsh *Auseinandersetzung*. Is the affinity with Nietzsche perhaps much older than the strife, in the early admiration for the radicality of Nietzsche’s philosophical solitude and atheistic way of philosophizing? In *Being and Time*, whereas the Hegelian concept of time is harshly deconstructed, the Nietzschean concept of historicity is highly praised, and we find for the first time an explicit allusion to something ‘essential’: ‘In his *Second Untimely Consideration* (1874), Nietzsche recognized *the essential* and expressed it in a penetrating and unequivocal way.’² In the analysis of the three dimensions of historical culture, the Antiquarian, the Critical and the Monumental, Nietzsche had understood that the unity of the three ekstases of historical time comes essentially from the future.

But isn’t there an even more original affinity? Heidegger often quotes and comments on Nietzsche’s famous sentences: ‘Man is the not yet determined animal’, or ‘Man is something that must be overcome’. Both question radically and from the outset traditional *anthropocentrism* and *humanism*. As early as *Being and Time*, Heidegger seeks to overcome the metaphysical definitions of man as *subjectum*, *ego*, reasonable animal, and thinks that Nietzsche’s critique of the ‘fictions’ of substance and subject, and in particular his attacks on the overestimation of consciousness, conscience and interiority have led the way towards a *decentring of man*.

Another important and fundamental kinship is the rediscovery of the Greeks and the primacy given to the pre-Socratics, which goes hand in hand with an anti-Platonism often violent on Nietzsche's side and which Heidegger shares, up to a certain point. This kinship is deeper than all the reservations expressed about Nietzsche's readings of the Greeks. His penetrating insight into the first Greeks 'is transcended only by Hölderlin'.³ Contrary to Hegel who looks back, Nietzsche, like Hölderlin, 'sees ahead and opens the way'.⁴ This praise is without doubt the highest that Heidegger can bestow. 'All the great problems have been raised before Socrates.'⁵ Nietzsche had said this, but he had been the victim of more than one illusion or error: the Romantic illusion of a 'physical' return to the Greeks in the sense of a resurrection of Greece ('One day, let us hope, we will become *physically* Greeks'⁶); and the error principally of transcribing the thinking of the first Greeks in the categories of Plato and Aristotle, taken as evident and normative, even when they are inverted.

It is certain that Nietzsche has been a victim of the opposition currently and wrongly established between Parmenides and Heraclitus. Here lies one of the essential reasons why his metaphysics absolutely never reached the decisive questioning, though in another sense Nietzsche did understand the great beginning of the whole Greek *Dasein* in a way which is transcended only by Hölderlin.⁷

Nietzsche stayed entangled inside the Platonic opposition between being and becoming that plays a fundamental role in the very definition of the Eternal Return, as well as inside the opposition between truth and appearance, entangled in such a way that he could never reach 'the true medium [*Mitte*] of philosophy' and think the Greek *Anfang* at its true depth. Neither Hegel nor Nietzsche was able to think the Beginning in an original and initial way; they see it only 'in the light of platonic philosophy'.⁸ In other words, Nietzsche stays prisoner of tradition: he confirms and maintains the essence of truth as *homoïōsis*, *adequatio*. He reveals this when he finally affirms that we should imitate not the Greeks, but the Romans.

As astonishing as the initial affinities is the way in which Heidegger, in spite of his main project to contain Nietzsche within the mould of traditional metaphysics, discovers an unexpected *justification* of certain Nietzschean positions. Indeed in his lectures, he is often inclined to transpose several Nietzschean concepts into the categories and the problematics of *Being and Time*. Thus art as the will to transfigure life is interpreted, in phenomenological terms, as 'radiant appearing'; the Nietzschean *Scheinen* as perspectivist illusion is transposed into appearing as a manifestation of being conceived as life showing itself in a higher

degree in the artistic phenomenon. The intensification of strength through intoxication in artistic creation is understood in terms of *Stimmung*, i.e. of transcendence. Thus also Eternal Return is fundamentally interpreted through the concept of *instant* (*Augenblick*), a sudden and complete unification of present, past and future with an ekstatic character which cannot be deduced of any 'now' (*Jetzt*). The authentic resoluteness which keeps *Dasein* in the 'repetition' (*Wiederholung*), not of facts, or concrete events with all their small details, but of basic possibilities, seems to be an echo, not of Kierkegaard, but rather of Nietzsche's most abysmal thought.

Such a justification is possible only from the 'yes to the essential'. But what finally constitutes this *essential* which would be held in common? Beyond the spontaneous or chosen affinities, beyond the *Wahlverwandschaften*, beyond the struggle with nihilism and metaphysics, beyond the rejection of anthropocentrism, beyond even the criticism of the primacy of theory and logic, the essential agreement for Heidegger seems to situate himself with Nietzsche in a *passage* (*Ubergang*). This word defines for Nietzsche the very essence of man: a 'transition', a 'bridge' (between animality and the Overman, but also between the reactive forces, the resentment and the new future affirmation). For Heidegger *passage* is a name for the present epoch, as a transition between the endless end of metaphysics and a 'new beginning' of thinking and of history. When Heidegger describes the historical situation of Nietzsche, he describes his own, taking up the Nietzschean expression: 'a precarious passage that points forwards and backwards and that for this reason is ambiguous for everyone even as far as its very nature and meaning as passage'.⁹ But why did Heidegger, instead of proposing as he does in this passage a 'dialogue of thinking' with Nietzsche, try, at least at a certain period, to reduce him to the traditional essence of metaphysics, and keep him only within the past and its dead-ends? Is it perhaps – a hypothesis which would need to be verified – in order to set outside of himself the nihilism of absolute subjectivity, the voluntarism, almost the pure will to will that he has been very near to sharing (e.g. in the *Rectorats Rede*), in order to concentrate upon this adversary the failure of this absolute subjectivity and the potentially catastrophic end of the History of Being that it is supposed to prepare?

The central part of the Heideggerian reading of Nietzsche is an attempt to demonstrate that Nietzsche's philosophy remains caught and enclosed within the traditional essence of metaphysics. In chapter VI of the *Nietzsche II*, Nietzsche's philosophy is reduced to five fundamental metaphysical terms.

Will to Power gives the name for the Being of beings as such, the *essentia* of beings. *Nihilism* is the name for the History of the truth

of beings thus determined. The *Eternal Return of the Same* means the mode [*Weise*] in which Being in totality is, the *existentia* of beings. The *Overman* characterizes the type of mankind [*humanitas*] which is demanded by such a totality. *Justice* is the essence of the truth of beings as Will to Power.¹⁰

Leaving aside the more complex question of Nihilism and of the essence of truth which would require a longer analysis, I propose to discuss to what extent and at the price of what distortions Will to Power, Eternal Return and the Overman are violently reduced to the traditional concepts of *essentia*, *existentia* and *humanitas*. I do not intend to show that the Heideggerian reading is wrong or arbitrary, or that Nietzsche totally escapes metaphysics, but rather to make more explicit some of the presuppositions upon which that reading is built.

Will to Power as essence

There can be no doubt that Will to Power is the name for the Being of beings since Nietzsche calls it 'the most interior essence of Being' (*das innerste Wesen des Seins*). But is it, as Heidegger claims, the same absolute Will as that asserted by Hegel or Schelling, or 'the Absolute that wills itself'? Is it a *Grund*, a *substantia* and *subjectum*, a metaphysical basis in which all representations are rooted? And can the values instituted by the Will to Power, according to its 'various points of view', be understood as its representations and, so to speak, as the *cogitata* of the Will? What does the perspectivistic character of the Will to Power imply? In short, what does the Nietzschean Will to Power mean for Heidegger?

In fact, we find in the Nietzsche lectures as well as in the *Holzwege*, three rather different and successive definitions:

(1) In the 1936–7 lecture on 'The will to power as art', Heidegger underlines the *transcendence* of the Will to Power. It is both self-affectation, emotion or passion of the will commanding itself (*Affekt des Kommandos*), and movement aiming beyond itself. But as much as it is neither the mere passivity of self-affectation, nor the activity of the objectifying will, it is ekstasis, as it is first of all to be lifted up beyond oneself towards Being. This analysis of the Will serves Heidegger to show next that the creative artistic state of intoxication (*Rausch*) as *Stimmung*, is transcendence, movement towards figures, forms, hyperlucidity, ecstatic opening and not self-complacency of the subject. 'Intoxication', writes Heidegger, 'explodes the subjectivity of the subject.'¹¹

(2) In chapter VI of *Nietzsche II*, 'Nietzsche's metaphysics' (1940), the Will to Power is defined as the *existence* of every being, but mainly as
